But we have by no means exhausted our efforts in this respect. On the contrary, there are not five cows in ten thousand that come up to the desires of the advanced dairyman, and not one in a hundred, or in a thousand perhaps, that may be called a really good cow. All we have gained so far in our breeding of dairy cows is a certain improvement, which is far from satisfactory, in the general run of certain classes of cows, and an approach only to perfection in a very few; so that there is a vast amount of patient and persistent work yet to be done before we can say that we see the beginning of the end in view. It is our misfortune that owners of cows either can not or will not see their interest in this matter; that they go on year after year violating all the rules of good breeding, and neglecting the simplest means of improving their herds. They do not seem to realize that it would be profitable to them to spend so small an amount as five dollars per cow in each herd to double the productive value of their cows. The average product of a good cow now is about 2,500 pounds of milk and 100 pounds of butter in the season between calves. The average product of a cow in a dairy kept for milk or butter, may be one-half more than this; and yet there are plenty of cows that will double it; many that will treble it, and some that will do even more. The rarity of the latter kinds of cows is so great that money can scarcely tempt their owners to sell them. And these cows are the product of breeding.

Every dairyman may go into this business of breeding and improving his herd, if he will. Every owner of a single cow should do it. It is not difficult; on the contrary, it is an easy thing to do. It requires a system, a plan, and persistence and patience in following it out. If a dairyman has one or two cows better than others, he should select these and begin a course of development with them. They should be bred to a pure-bred bull, the progeny of as good a pure-bred cow as can be procured. In selecting this bull, it should not be taken at random. Its pedigree should be examined and scrutinized. The dam and granddam and the sire should belong to good families. When it is considered that one begins a life work when he begins to improve a herd, and that a false step will ruin all, the beginning should be made carefully and with the best judgment. The cows bred to such a bull should be managed with care. They should be well fed and every effort made to stimulate the milking capacity while carrying the calf. Thus the calf undergoes training before its birth, for it will partake of whatever character is given to the mother. In laying a basis for improving a herd, after procuring good animals to start with, the rearing of the progeny is of great importance. This will, however, be treated of in another place; we are now discussing breeding only. But it is not out of place here to mention incidentally that this is to be well done so as to fix a second step in the progress.

The first breeding of the young heifer is the critical point, for it is a fact that this *does* affect every after breeding to some extent. Now if the bull is found to be a good one, and the progeny promises to be better than the dam, it should be bred to the sire. This would be much more likely to fix the good points of the parents on the offspring, than to bring in new blood, which might upset all, and very easily too. If the young cow should be found better than her dam, the same course should be pursued and thereafter the best bull calf from the best cow should be retained to replace the the first sire, or, if prejudice should create an objection to this course, a bull may be selected that was less closely related to the first sire, but, if possible, it should be brought from the herd from which the latter came originally. In a herd of ten or twelve cows, there will be scarcely need to go outside for new blood for six years or even twenty; but when this is done, great caution should be exercised. Every step should be upwards. When an improvement is secured it should be made permanent and another planted upon it. This cannot be done without study and observation. The breeder must have a standard of excellence of his own for his guidance, and he must not depart from it. The best this year must be the best next year, and the next year, or no real progress will be made.

In general, the standard of excellence will be the pail and the churn. The handsome cow is the one that handsome does, and form and color are all subsidiary to the main point—the profit. In using this term subsidiary, it should carry all that it implies for form and color, have a certain value; because when a good animal transmits one point it is likely to transmit all; so that if one's best cow has some peculiar traits of form, color or feature and her calf has these, the calf will be likely to have the other good points. This I believe to be the only value attaching to the much vaunted escutcheon.

The profit in the case is clearly seen. If a cow gives an average of four pounds of butter a week, and butter is worth 25 cents a pound, the cow returns $30 for the 30 weeks of her productive season. If she gives seven pounds a week her product will be $52.25. If she gives 10 pounds weekly, or 300 pounds in the season, her income will be $75 and she will cost no more to feed and keep than the four pounds cow. The difference in a herd of 10 cows would be $450 yearly, or the interest at ten per cent. on $4,500 and taking the useful life of a cow at ten years, the herd would be worth precisely $4,500 more than the four pounds cows, or $450 each. So that if the farmer were to pay $225 more for such cows than for common ones, he would get his money back in butter alone, with 100 per cent. profit in 10 years; and the extra value of the calves would be a sort of extra dividend or bonus. There is surely sufficient inducement in the probability of soon reaching such a profitable improvement in a dairy herd to attract the attention and enlist the interest of all owners of dairy cows.

Farm Topics.

THE CARBON UNIVERSAL MANURE.

The abounding charity manifested by the people of England has devised, among other excellent measures, County Societies for aiding the industrious, by procuring, near large cities, portions of land divided into allotments of various sizes, for growing vegetables, etc., and by supplying good seeds, manure, implements, etc. on convenient and easy terms. These truly beneficial societies have been in operation now many years, and are perhaps not exceeded in real deep and wide usefulness by any, unless by some later ones which go a step further by inducing the utterly idle and dissolute, or those tending to become so, to take up with independence, self-reliance, self-respect and self-sustenance.

The Hereford Society for Aiding the Industrious was established in 1841, and soon became prosperous. In 1848 a steam flour mill was built, in part with borrowed money, in order that the poor might get the means of making their own bread from their own small grists, of good quality and without delay. This also prospered. The debt was paid and no more contributions were solicited. The managers of the society receive no remuneration but the satisfaction of success in a line of great good to a great number. They now let out above 500 allotments annually near the city of Hereford, the population of which does not exceed 25,000.

Some years ago they entered upon a promising line of economy, which proved a disappointment and a great loss. It was resolved to undertake the cultivation by spade-husbandry and with earth-closet manure. This was when the late Rev. Henry Moule's invention, invaluable in a sanitary point of view, was expected to bring soil-culture in England up to the same measure of great productiveness with as little outlay as that of China. It was not found until later that whereas the Chinese—who depend almost wholly upon the waste of their own houses to feed the soil—apply this powerful means of fertility in a fresh and liquid state, the dry and porous earth and lapse of time that apply to the Moule system, allow of such oxidation as locks up and renders inert, at least for immediate profit, the same matters dessicated by dust and ashes.

A capable gardener was appointed superintendent of this culture of the seven acres, and he did all he could to secure the success of the undertaking. He died about two years after being appointed, and another year's trial proved what was already seen—that the scheme was a failure, owing to the manure proving far less valuable than was expected. An agricultural and sanitary chemist of established reputation, Mr. G. A. With, was then engaged, and a laboratory and study provided with apparatus for investigation and a plot of land for experiment. It was proved that the Moule system failed as to manurial results, and the aim then was to discover what other available means of manure could best be used. The investigations and trials led to the composition, by Mr. With, of what is called the Carbon Universal Manure, which has been used successfully on the society's ground and elsewhere for three years, and for which Mr. With first, and the society next, generously publish the formula, viz.:

	Pounds.	Cost.
Sifted dry earth	1,600	$0 75
Sifted coal ashes	1,100	75
Kainit, finely pounded	80	1 00
Nitrate of soda, finely pounded	80	3 00
Best Peruvian guano	200	7 00
Bone meal	150	3 00
Pure dissolved bone	325	7 25
Superphosphate of lime	100	1 50
Coprolite, or phosphorite powder	120	1 20
	3,735	$25 45

The proportions are to be strictly adhered to. The cost, including the labor of breaking, mixing, sifting, etc., is set at about $15.80 per ton, and the manure is said to be far superior to anything of the kind purchasable at present for $38.80 per ton. It will keep, without deterioration, in a dry place for any length of time; is free from any unpleasant effect in handling; does not exhaust the land, but, on the contrary, adds to its fertility, and is adapted to all forms of vegetation. Apparently it fully restores the capability of the soil for a crop of the same kind as has been continued year after year—potatoes, for instance—until the soil can no longer produce it. It advances the germination of seeds and the growth of the plant from the first.

These are the statements published by the society, which only manufactures enough of the mixture to supply its poorer tenants. The report of a committee of the managers of the society, who inspected comparative growths of various things with and without this manure and with substitutes, gives a highly favorable account of its effects. The only allusion to the amount used is that, as the average cost of a top-dressing of artificial manure for one acre is 32 shillings, the carbon manure made by the farmer himself would cost but 12 shillings.

TYRONE.

PRACTICAL ENSILAGE.

Our contributor, Professor E. W. Stewart, has sent us the following account of practical experience with a silo, sent to him by Mr. B. A. Avery, a progressive farmer, who keeps 100 cows, of which about 80 are constantly in milk:—

PROF. E. W. STEWART:—The interest you have always manifested in everything that pertains to agriculture, and especially the friendship you have shown toward me, prompts me at this time to write you in relation to an enterprise I entered into last Summer—with not a word of encouragement from any farmer, and with not a few sneers and almost universal prophesies of a complete failure from the whole community, except from my friend and neighbor in Syracuse, Hon. Daniel Bookstaver, who gave me the benefit of his reading and thinking on the the subject, and a considerable amount of supervision after the work was in progress.

I constructed a silo for ensilage, following as nearly as I could the instructions as given in the book written by Mr. Goffert. The silo is 70 feet long, 12 feet deep and 12 feet wide, with a second silo on the side of this 30x12x12. I had prepared specially for this purpose between 11 and 12 acres of fodder corn, drilled, which was very thrifty, reaching, on an average, about 12 feet high and very thick on the ground. On the 3d of September I commenced cutting the corn with one team, and hauling it a distance of about 80 rods to the silo, where I had a stationary steam engine and two Daniel's cutters so arranged that it took six teams constantly to supply material to the two machines, with two men at each. The stalks were cut, on an average, into about half-inch pieces, and dropped into the silo, and then spread over the surface as evenly as possible. The lengths were tramped down by men and boys the first day; but, fearing that it was not sufficiently packed, at the suggestion of my friend I put a pair of mules in the pit and kept them constantly treading and packing the corn as it was spread, until the work was done in an entirely satisfactory manner, the close sides and ends where the mules turned having been trodden down by men as well as it could be done.

After the silo was filled I covered with planks and weighted the covering heavily with large boulders as the most convenient source of pressure then obtainable. Some wise men, *who think they know all about farming*, gave me 10 days, some, more charitable, gave me 30 days, to see it all rotted and fit for the manure heap, as they said. But Bookstaver, noticing the pit weekly, was still more and more confident of success, and I must say never for a moment from the day the silo was filled until it was opened by me, on the 1st of December, did he doubt its perfect success. He always answered every objection which was thrown at me with—"It has succeeded in France; it will succeed here," "Somebody must have nerve and enterprise to try it, and you are the man to do it." "You will succeed."

Now for results:—On the 1st of December last I opened the silo and commenced feeding my cows and horses. The food was fresh, green, with only a slight alcoholic smell, and all my stock ate it at once with the greatest avidity, and seemed to grow more fond of it the longer they ate of it. There is none wasted, and all my cows have averaged *over a quart of milk more per day since* the food was given them, after the third day, and I am still looking for even a better yield. The cattle do excellently well on it, and I am well repaid for the experiment after listening to all the croakings of those who dare not step from the beaten path, and I can now laugh to a good purpose when I see the increase of milk of my herd of 80 cows and witness their enjoyment of the food which I hope all farmers' cows in a few years will enjoy.

Now you will naturally ask, "Does it pay?" Well, I will give what the cost has been to me, and you can judge for yourself. The silo cost me, ready for filling, just about $100. I had only one concrete wall to put up, on account of having the walls of the barn already on

three sides, and the silo is still good for many years to fill again. The labor of gathering the corn and filling the silo and covering, all complete, without details, cost a trifle under $200. I have been a farmer almost my entire life, and never have secured so much or such good feed at so little expense. As proof, I intend the coming Summer to build another silo as large as, if not larger than, this one, and fill them both; and I predict that in less than five years silos will be common and found as necessary as a chimney to a house, if comfort and profit are studied. B. AUSTIN AVERY.

Pres. Onondaga Co. Milk Ass'n. Syracuse, N. Y.

Farm Economy.

LITTLE HELPS.

EVERY little helps. When one is in a hurry, by and by, and work presses, he may be glad of the help of some little contrivances which may save time and labor and which may be made in a few hours in the tool-house or shed or in the barn on a stormy day when the weather forbids out-door work, and the housewife wants the house to herself. This month the orchard will need to be pruned, and to climb the tree on a sloping rail and to sit on a limb to cut off superfluous branches are neither safe nor agreeable.

A Tree Ladder

may be made very easily in the following manner. Procure a straight pole 18 to 20 feet long or a strong 4x4 scantling of straight-grained timber and two pieces half as long. Bore these with one-inch holes so as to make a ladder of the kind shown at fig. 88. Make a sufficient number of rungs of strong white oak or hickory, one inch and a quarter thick in the middle and tapering to the ends, as if made for a

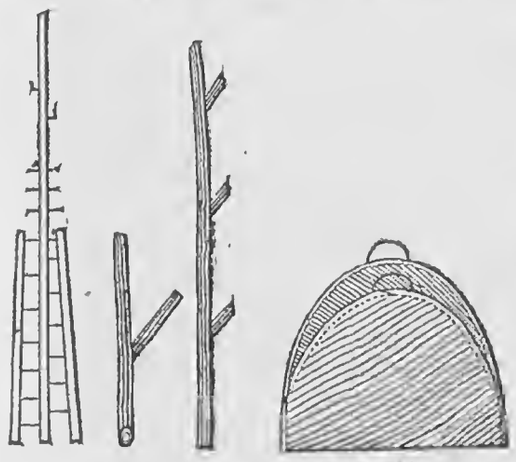

FIG. 88. FIG. 89. FIG. 90.

common ladder, and put these in, on alternate sides as shown. This is all that is necessary, but the rungs may be put in on each side alike if desired. These should be wedged on the outside in the usual manner. A few extra ones may be put through the center pole above the double ladder and some hooks should be fastened above these near the top. The hooks should be blunt-edged screw hooks made for use in pantries, and not sharp ones for obvious reasons. This ladder may be rested in the fork of a limb so that one may get to the outside of the tree to prune the end growth which cannot be reached by ordinary ladders or methods.

A Tool Bag

to hold pruning saws, chisel and knife will be useful. Make this of a piece of sacking or carpet, cut in an oval and doubled as shown at fig. 90. The edge is bound over a piece of small rope or fence wire and three or four inches at the bottom on each side are sewn together and strengthened with pieces of leather. The ropes are extended at the top on each side to form loops for handles. This bag with the tools can be hung on to the hooks of the ladder or on to a limb by an S hook of wire.

Plow Shoes.

When a careless person takes his plow from the shed to the field he permits it to make an unsightly furrow the whole distance, digging into the yard, the road, and sometimes into the sod of a meadow which he crosses. Every plow should have its own shoe belonging to it. It should be placed on it in the shed and should be drawn on it to the field and home again. A shoe may be made of a piece of plank fig. 91, *a*,

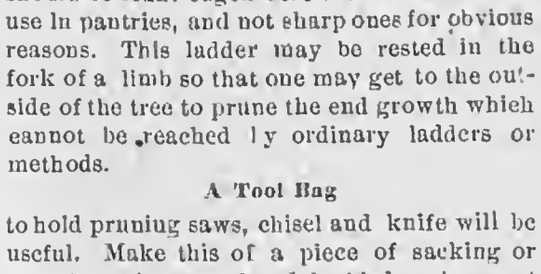

FIG. 91.

or a slab of timber split from the end of a log, fig. 91, *b*, and having the bark smoothed off. A piece of worn-out leather tug-strap is strongly fastened on to the front of either of these shoes and the point of the plow-share is thrust under this. The plow glides easily over the ground when resting on this shoe.

Another shoe, fig. 91, *c*, can be made of a crotch from the wood pile. The upper part is flattened, except at the point, which is hollowed out with a chisel to fit the point of the plow-share; a crossbar is fastened at the rear end upon which the plow sole rests. A great variety of such shoes may be made. The mention of the wood pile reminds one that all those pieces of wood having spurs of small limbs on them may be turned to good account in the stables and barn as

Hooks for Harness,

tools, bags, chains, clevises, and other things too numerous to mention. It does not pay to be running to the store with one's hand in the pocket, or, worse, running up a bill, for every thing one may want, when it can be made at home. A dime saved is a dime earned and a dime a week will pay for a copy of the RURAL NEW-YORKER and one other good paper. These spurred pieces of wood as shown at fig. 89, should be flattened behind the spur taking care to leave them strong and longer above the spur than below, because the strain of the weight comes there, and to give plenty of room for two strong screws above and below. The long pieces will be useful in tool sheds and far better than nails or hooks to hang things upon.

A Tool Sled or Boat

will be useful to carry a harrow, bags of seed, and other matters to and from the fields. In making fences it will carry rails, posts and tools. In fact, it is one of those things which a person misses more after he has once used one, than before. One very easily made is shown at fig. 94. Two pieces of 2x6 plank (hard wood is preferable) are cut about six feet long, rounded at one end and sloping at the other. Boards three feet long are then nailed with twenty-penny nails on to these runners. A second pair of runners are made; the sled is turned up on these, placed just within the lines of the others but on the other side, and these are nailed as the first pair were. This strengthens the sled, and furnishes sides which serve to hold on the load. This sled or boat is a sort of *multum in parvo*. It is drawn by hooking a chain through the holes in the front end of the runners. If the load needs to be dumped quickly it can be turned over by turning the horses sharply to one side and can be drawn back on the upper runners, and then reversed again when required. When snow covers the paths and roads a piece of board may be nailed to the sloping ends behind, and by drawing it backwards it makes an excellent snow plow, or road breaker; the slope of the board prevents the sled from rising on the snow. If two boards are fastened in the form of a V at the front the snow will be pushed off on each side. It makes an excellent corn marker, using the three-feet-wide runners; and for potatoes or beets, by using the 30-inch runners on the other side. It may be fastened to the harrow, and the field marked one way while it is being harrowed, the driver riding on it to steady it. It makes an excellent scraping table to dress hogs on and in many ways will be found of use.

Clamp for Setting Bean Poles,

In setting bean poles in a market farm, hop poles in a hop yard, or stakes in a vineyard, it is always a troublesome job to get them placed firmly. A very handy contrivance is used in the French vineyards for pressing the stakes in the ground. It is made of iron, fig.

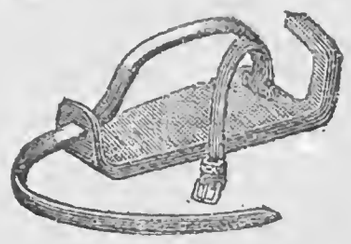

FIG. 92.

92, and has a claw at one end. It is fastened to the hollow of the boot sole by a strap as shown at fig. 93. The stake is held by the claw and the harder the foot presses down the tighter the claw holds the stake. A hole is first made in the ground with a pointed bar and the stake or pole, sharpened at the point, is then thrust in the hole until it is firm.

A Bushel Box.

Now is the time for making crates or boxes for use at harvest for corn ears, potatoes, roots, fruit, etc., etc. The use of a set of these boxes will save much more time than their cost is worth. A box to hold a heaped bushel should be 16⅔ inches long, 14 inches wide and 12 inches deep inside measure. This makes 2751 cubic inches and a heaped bushel is 2750 inches. To make the box, shown at fig. 95, procure end pieces of 12 inch-wide box boards 14 inches long. A 12 foot long board makes 10 pieces. The bottom and sides are made of 1½ inch wide strips, ¼ inch thick and 17⅞ inches long; the end boards being ¾ inch thick. Six strips make the bottom and five each side. The top strip on each side is set a quarter of an inch below the top edges of the end pieces. These are very useful for storing potatoes, apples or pears in a cellar as one box can be set upon another in tiers. In the field, corn ears may be husked into them, or potatoes picked into them, or apples gathered in them in the orchard, and they may be lifted into the wagon and lifted out, saving much time and labor in handling these crops. For lifting, handle holes are cut in the ends, by boring 1¼ inch holes close together and trimming between them with a knife or a chisel.

Industrial Societies.

VERMONT DAIRYMEN'S ASSOCIATION.

THE recent meeting of this Association at St. Albans was probably the most successful, in point of attendance, of any agricultural assemblage ever held in the State. On the second day Armory Hall, with seats for 700, was crowded, and on the first and third days the somewhat smaller hall of the Welden House was equally full. The principal subjects discussed were ensilage, breeding, feeding and selection of dairy stock, oleomargarine, and fertilizers. The chief speakers were Professors Arnold and Engelhardt and Mr. T. D. Curtis, of New York; Farm Manager Sanford, of the New Hampshire Agricultural College; Chemical Professor Sabin, of the Vermont Agricultural College; Leander Wetherill, M. Whittaker, and Editor Cheever, of Massachusetts; Captain Morton, General Thomas, ex-Governor Smith, Governor Farnham, and George W. Whitney, of Vermont.

Undoubtedly the most valuable contribution to dairy knowledge was the paper of the latter gentleman, a painstaking, intelligent, practical dairyman of the town of Williston, who gave the figures of a series of tests continued through the year upon a family of cows, to ascertain the results, in point of profit, from liberal grain feeding for butter production. These tests resulted favorably, the product being increased so as to give a liberal profit upon the extra feed, aside from the gain in the quality of the manure.

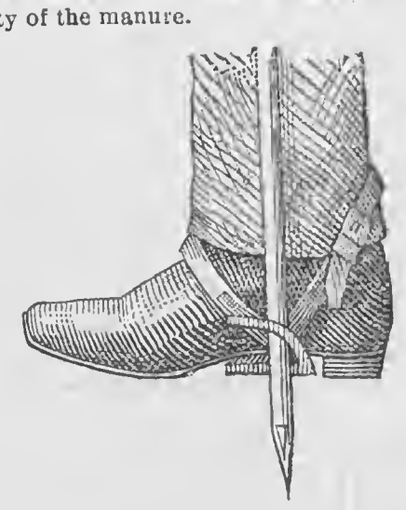

FIG. 93.

In regard to ensilage, Captain Morton and General Thomas both reported entire success in the preservation of finely-cut green-corn fodder by this method, the acceptability of the ensilage, not only to cows, but to swine and other stock, and satisfactory results in the flow of milk, quantity and quality of butter. Captain Morton sells all his butter at 35 cents to a dealer who supplies the tables of the naval officers of the United States navy yard at Boston, whose customers are entirely satisfied with ensilage butter. The feed of his cows is not, however, entirely of ensilage. Their food is mixed in the proportion of 250 pounds of ensilage to 180 pounds of chaffed hay and 75 pounds each of corn meal and wheat-bran. This constitutes the ration, thrice repeated daily, for 27 head of stock, large and small. He tried both the Blount and Southern Gourd seed corn, and rather preferred the latter. He plants in rows two feet apart, and cultivates entirely with the Thomas smoothing harrow and a horse-hoe.

General Thomas, whose methods and results were quite similar, expressed the belief that he could grow 40 tons of ensilage material to the acre, and thought it would equal, as feed for cows, 20 tons of hay. The General did not hesitate to express the opinion that Dr. Bailey is a good deal of a humbug, in which Captain Morton concurred.

Farm Manager Sanborn, a most intelligent and earnest young man, spoke strongly for a new departure in New England husbandry, to be inaugurated mainly by the fitting of all suitable land for machine tillage and the cultivation of large areas by that means. He had found that in this way, with the labor of one man, he could grow 16 acres of corn, which gave a net profit of over $600. He regarded it a waste of labor to grow roots for stock when corn could be grown. He used large quantities of artificial fertilizers with profit, but was particular to know what his soil required so as to avoid waste. He did not believe early-cut hay so profitable, either for milk or meat, as late-cut fed in connection with grain, and regarded cotton seed meal as especially valuable, first as a feed, and then as a fertilizer.

Professor Arnold spoke concisely of the necessity of a close and business-like management of dairy farms, and thought that by careful attention to economy in manures, by skill in the feeding, selection and breeding of dairy stock, by thorough farming and careful, intelligent manufacture the cost of butter and cheese might be much reduced to the producers, and that they might then be afforded with an equal profit at a considerably lower rate than now, the result being a wider and steadier market, both at home and abroad.

Mr. Curtis read a thoughtful and well-considered paper upon the economy of the dairy, in which he pursued a somewhat similar line of thought to that of Professor Arnold.

Profs. Englehardt and Sabin gave very valuable instruction regarding the nature, manufacture, application and economy of both natural and artificial fertilizers. Such addresses do not admit of the condensation required in this brief notice. The most important single feature of their remarks was the insistance upon a careful preservation of both the liquid and solid excrements of domestic animals.

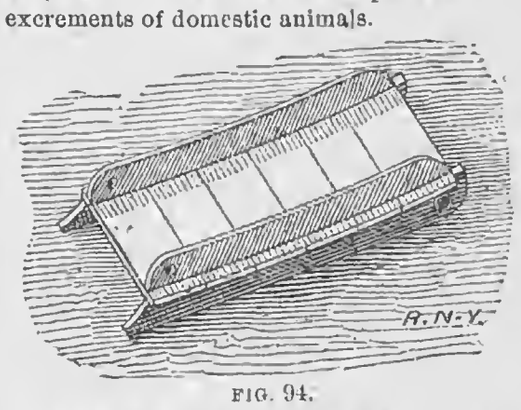

FIG. 94.

The two Governors complimented the farmers handsomely (our public men all know how to do that), and Governor Farnham thought strong efforts should be made to extend the benefits of these agricultural meetings to the farmers of the back towns, who need them most. They were good citizens, he thought, but poor farmers. Governor Smith (who, as President of the Central Vermont Railroad, is our principal railroad manager) is a very eloquent and interesting speaker, and withal a good farmer, whose great farm on St. Albans Point, Lake Champlain, testifies to his intelligent interest in agriculture. In his short address he referred to the agricultural distress in England and Ireland, and prophesied a large increase of immigration to America from those countries, a considerable proportion of which New England ought to retain. He thought the example of English farmers among us would be beneficial, and he urged all Vermont farmers to renewed efforts to improve their methods and thus hold their own in the fierce competition with the West.

Mr. Wetherill made a savage raid upon the fraudulent makers of oleomargarine, suelne, etc., and a hardly less severe one upon the makers of dairy butter who use artificial coloring. Mr. Whittaker combatted the opinion advanced by some speakers that there was little progress in New England agriculture, and by comparisons of the present with the past he demonstrated that this section of the country fully holds its own with the rest of the nation.

Mr. Cheever gave a summary of the present state of knowledge regarding abortion in dairy herds, favoring the idea that it is contagious or infectious, and requires isolation of diseased animals and thorough purification of stables where the disease has occurred. T. H. H.

Orleans Co., Vt.

MEETING OF THE N. Y. HORT. SOCIETY.

[Rural Special Report.]

THE twenty-sixth annual meeting of the Western New York Horticultural Society was held in Rochester Jan. 26th, the sessions continuing through two days. The morning session of the first day was occupied in organizing, nominating officers and other routine work. In the afternoon the first business was raising by subscription the sum of $317, this being the debt of the society. The association raised $500, which places them on a stronger financial basis than they have ever before occupied.

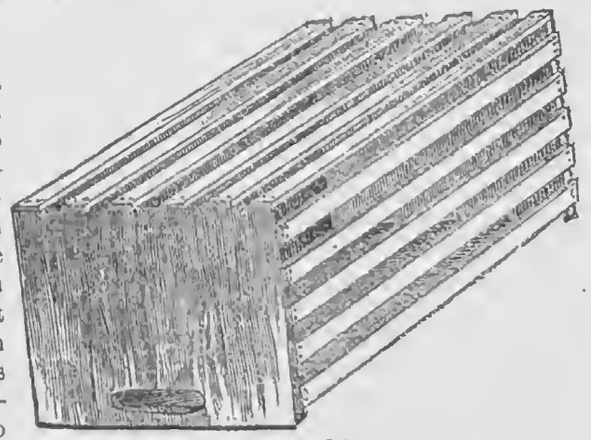

FIG. 95.

Mr. W. C. Barry then read a paper upon "The New Fruits," after which the question, "What is the experience of the last year with the different varieties of fruit?" was discussed. Dr. Beadle, of Canada, from one year's experience with the Moore's Early Grape was much pleased with it. It ripened a day or so ahead of the Champion, was as good as the Concord, and seemed to be hardy. Mr. Green had ri-

pened the Lady Washington and had found it fine in appearance, of good quality and a little later than the Concord. Mr. Willard spoke highly of the Vergennes, which was a little later than the Concord, of good quality and a fine keeper. Mr. Fowler had eaten specimens of the Niagara on Oct. 2d, when they were picked from the vines, and he had found them good. Mr. Thomas regarded the quality of the Niagara about half-way between the Concord and the finer sorts. Mr. Hooker said the Pocklington was a good grower, but not so strong as the Niagara; it was hardy, as early as the Concord, and of better quality than he had thought. W. C. Barry was agreeably surprised in the Pocklington.

The question of new peaches was then taken up. Mr. Bronson said that the very early sorts were not giving satisfaction, and to recommend them as profitable sorts would be very misleading. Mr. Hooker said that May's Choice was a beautiful peach of Crawford character, but he was not sure it was a valuable acquisition. The Downing and Wilder were like the Alexander and Amsden. Mr. Younglove had found the Salway to be a profitable late variety.

In the evening Mr. Zimmerman, of the Committee upon Entomology, read a report describing the insects which prey upon the plants and trees, which was followed by a paper upon the subject of destruction of noxious insects by Prof. Wm. Saunders, the celebrated entomologist of Canada.

The morning of the second day was devoted to the hearing of the reports of the different county committees upon visiting orchards. Mr. V. Bogue, of Orleans County, reported the crops of that county to be:—of apples, 140,000 barrels; quinces, 2,600 barrels; pears, 1 510 barrels; plums, 3.300 bushels; cherries, 63,000 pounds; grapes, 2,500 baskets. W. S. Little, of Rochester, read a paper upon the Hornbeam as a hedge plant, regarding it as of great value for this purpose. Mr. H. B Ellwanger followed with a paper upon Typical Roses, after which the President delivered his address. A desultory discussion followed. Mr. Fowler had used saltpeter upon tender grapevines at the time seeds were forming, and with good results. Mr. Younglove thought that if fine fruits were wanted, thinning was very important. It pays well. It must be done thoroughly to secure the best results.

The subjects of canning and drying fruits, the profit and benefit of the fruit grower, were taken up. Mr. Redmond reported that Wilson's Albany was the best strawberry for canning. Mr. Hooker said that in addition to its other good qualities the Baldwin was very valuable for drying. It weighs heavy, is of good color and is acid. Mr. Woodward thought evaporating to be just what we want, and if we keep the poorest apples out, it will prove a great benefit.

The subjects of pear blight and peach yellows, preventives and cures, elicited no new thoughts. The best way to do is to keep your trees in a good, healthy condition. If blight appears cut off the affected portions and burn them; but if yellows appear dig out the trees and burn them root and branch. Mr. Wheelock, an extensive buyer of fruits, had found the Newtown Pippin to do well in but few places, and only on the east side of the Genesee River and through the valley.

The society then discussed the questions "How shall we get sufficient manure for our extensive orchards in Western New York?" "How can we increase the quality of barn-yard manure?" "Can any of the artificial manures be profitably employed in orchards?" Mr. Hooker said that two objects were aimed at by the fruit grower—1st, a good growth of wood; then fruit; but he doubted if it was economy to stimulate trees too much. Mr. Phelps used his barn-yard manure upon his orchard, while his field crops were treated to superphosphates. Mr. Barry said ground bones were good. Mr. Saunders thought a very small amount of phosphorus in manures would be beneficial. Mr. Woodward said the measure of the manure was the measure of the fruit. He would apply manure just when he had it. Mr. Reynolds told of a case where a crop of green clover turned under, produced better effects than could be seen on a neighboring field well manured.

In the evening, in reply to "Is it profitable to graft apples upon crab stock?" Mr. Bogue cited a case that had given very poor results. Mr. Dempsey had a Peck's Pleasant upon a crab stock. The union worked satisfactorily, although the graft was larger than the stock.

"What is the comparative value of wood ashes, lime, plaster and salt for fruit trees and in what way may they be applied?" was the next question discussed. Mr. Green thought ashes were much the best. Mr. Willard believed that salt was very beneficial to some trees.

The question "Is the clematis meeting public expectation as a decorative plant, and what are the best and most useful varieties?" was discussed. W. C. Barry thought it a very useful plant, and one of the best ornamental climbers. It is hardy and very beautiful. Mr. Hooker said there is everything to say in favor of the clematis.

The society then adjourned. H.

Floricultural.

PASSIFLORA PFORDTII.

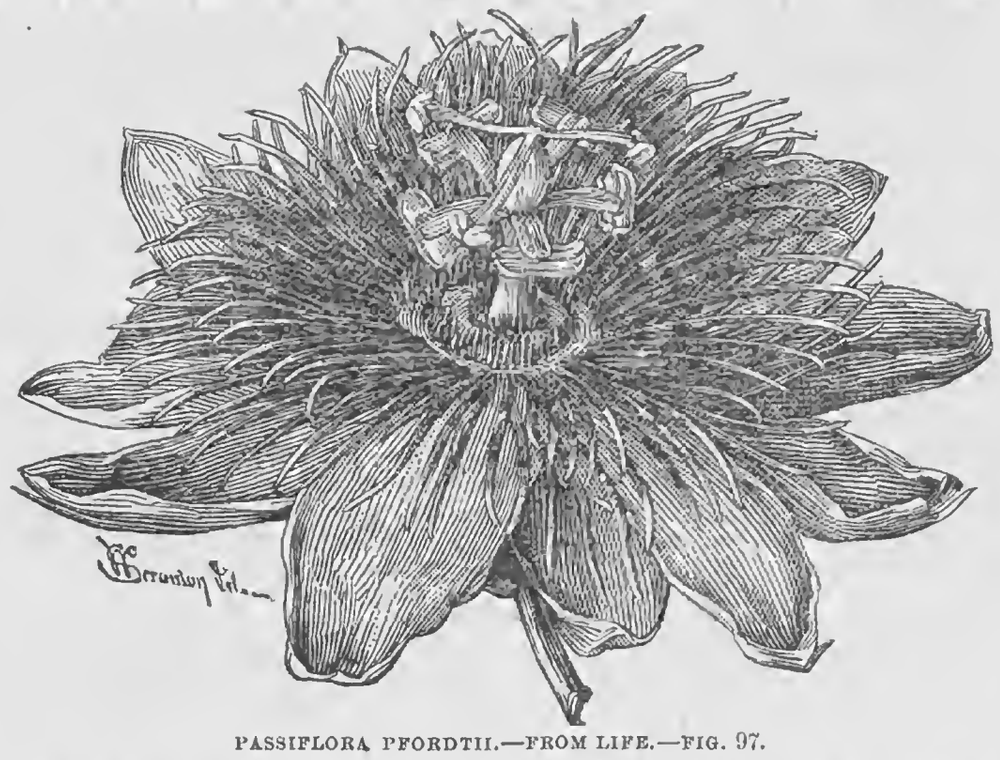
PETER B. MEAD.

THERE is scarcely a genus of any size so entirely made up of singularly interesting and beautiful plants as that of *Passiflora*. Some of them are valued in their own country as much for their fruit as their beautiful flowers. Some do best in a hot-house; others do well in a green-house, and two or three are sufficiently hardy to be grown in the open air, with a slight protection in the latitude of New York or none at all in some cases. The tops die off, or rather are killed off, during the Winter, but the crowns send up very strong shoots in the Spring. To the latter class belongs Passiflora Pfordtii; but it is not so hardy as either Buist's seedling or the old P. cærulea and incarnata, though very much finer in the abundance and beauty of its flowers. It is a strong grower, with mostly three-lobed leaves, the lower ones sometimes being entire. The flowers are produced in the axils of the leaves, and are of a bluish-purple color, the sepals being sometimes edged with white.

The accompanying portrait is a faithful one, showing the average size of the flower, as well as the remarkable form common to all the Passion Flowers and Tacsonias, a closely allied genus. In the green-house it will bloom constantly and abundantly all Winter, but to me its chief value consists in its usefulness as an ornamental flowering plant for the open air. It will soon cover a large space, and may be grown on the piazza, against the side of a house, on a fence, or wherever wires or strings can be placed for its tendrils to cling to. It delights in an open, sunny exposure. An old plant will bloom more abundantly than a young one.

Beginning with a young plant, it should be turned into the border early in the Spring, or into a large pot or tub, if that be preferred. Let it make four or five feet of growth, and then cut off five or six inches of the end, which will secure three or four leading shoots instead of one. The flowers are borne in the axils of the leaves, and more abundantly on the laterals than on the main shoots; it will therefore increase the number of flowers if the ends of the leading shoots be pinched off as soon as the laterals make their appearance. A young plant, like the one started with, will come into flower about August, (an old plant sooner,) and will continue to bloom till stopped by freezing. When the ground gets a little hard I cut the plant back to about four feet, bend the canes to the ground, fasten them there with pegs, and cover the whole plant, crown and all, with two or three inches of sand or light soil, and finish off with a covering of five or six inches of leaves or long litter. The plant may be grown in a tub during the summer, (in which it will flower freely), pruned late in the Fall, and kept in a cool cellar or room during the winter.

The flowers of P. Pfordtii are fragrant, as are others of this class, but not all. The flowers of others remain open only a day; but in September, when the nights begin to get cool, I have often known the flowers of Pfordtii to remain open thirty-six hours, and then seem to close reluctantly. It is a plant that I do not hesitate to recommend for general cultivation; if not in the border, at least in a tub, to be wintered in the cellar. It strikes readily from cuttings in September, which can be easily wintered in the house. It is too subject to the mealy bug and red spider for a room plant; but is free from these pests in the open air.



PASSIFLORA PFORDTII.—FROM LIFE.—FIG. 97.

COAL OIL FOR MEALY BUGS.

Two or three years ago I wrote to some horticultural journal, recommending, from my own experience, undiluted coal oil for the destruction of the mealy bug. Since that time I have tried all the various remedies mentioned in the "papers," but I am sure I could not keep my little greenhouse free from the pest without that little bottle of kerosene and a feather to apply it with. I use a pail of hot water whenever I wish to give my plants an "overhauling," and holding my hand to keep

NEW DOUBLE WHITE BOUVARDIA.—FIG. 96.

the soil from falling out, I sonse the plant in water as hot as I can bear my hand in, and have never injured any plant, except mimulus. Afterwards I use the same water to wash the mold from the pots, and in this way one pailful of water will clean twenty or thirty three to five-inch pots. I then take all the pots which are too large to be dipped in the pail and search them carefully for mealy bugs, and if I find anything suspiciously white, I touch it with oil, when, if it is mealy, it will turn red. I apply the smallest possible quantity of oil and brush with a feather around the axils of leaves and branches which give any appearance of being infested. If the plant is tied to a stake or trellis, the pest is sure to be under the string or on the wood, and I am quite certain that an old trellis will harbor the family for years, even without a plant near them. This thorough treatment will last for a month, but every time I handle a fuchsia or bouvardia I look for mealy bugs and have my coal oil convenient.

I think there are not many greenhouses free from this pest, from the fact that I often find plants, and even cut flowers which I order, white with the filthy things.

I should not dare to use coal oil mixed with water and applied with a syringe, as has been lately recommended; for where I have applied it to growing or tender leaves it has sometimes killed them, while I use it on the stems or the older leaves with impunity. Besides it would never completely destroy the mealy bugs if used in that promiscuous way, for it does not kill unless it touches them. For that reason neither hot water, soap-suds, carbolic acid, tobacco or any other solution or compound applied with a syringe will do any more than hold the bugs in check. I know of quite a number of florists and amateurs, who use coal oil as I do, and they all agree that they have found nothing better. G. W.

Rock Falls, Ill.

A NEW BOUVARDIA.—A new, double-flowered white bouvardia is offered in London by William Bull of which the accompanying illustration may serve to give some idea. Bouvardias are delightful plants either under glass or for the Summer border, for which latter purpose they are not as much employed as they deserve to be.

We have mislaid Mr. Bull's catalogue from which our cut is reproduced. Is this the "Alfred Neuner" of Nanz & Neuner of Louisville, Ky.? Or are there two double white bouvardias? In the latter case, it appears that one engraving answers for both, since Messrs. Nanz & Neuner's cut is the same as Mr. Bulls.

Scientific and Useful.

THE PREVENTION OF INFECTION.

PROFESSOR F. H. STORER.

IT is noteworthy that many points of interest for agricultural practice might be gained by an attentive examination of the conclusions of medical men with regard to the so-called "Germ-theory of disease;" for, taken in its widest sense, this theory assumes not merely that various diseases but most kinds of fermentations and decay, are produced by the action of microscopic organisms. Whatever the doctors may have gained in the way of destroying such organisms or of checking their increase may well be taken to heart by the farmers; not because such knowledge can always be made immediately useful at the farm but because some of these practices of the physicians are likely to be analogous to what is needed by farmers, and because they indicate very clearly what kinds of methods the farmer may fairly hope for and search for to meet his own peculiar needs. Thus, in the case of wounds, it was noticed long ago by surgeons that wounds healed much more rapidly in the country, even at a distance of but a few miles from the city, than they did in city hospitals. Apparently, the air of the hospitals was at fault; and pains were taken in some places to purify the hospital air to the utmost. Buildings were constructed with a special view to having the air within them pure; and perfected ventilating arrangements were introduced, without regard to cost, by means of which all unpleasant odors and even the carbonic acid, which results from breathing and from lights, should be kept down to almost or quite as low a proportion as exists in country air. But all to little purpose, for the disparity between country and hospital practice, as regards the healing of wounds, remained. Then, the idea was broached that something in the wound itself must be the cause of the difficulty; something which by passing from one wound to another should propagate the hurtful influence and maintain it in spite of the purest air. There is now good reason to believe that this is the correct view, and that the trouble is really caused by minute organisms which find fit feeding place upon disorganized animal matter, and which may be carried from one wound to another by way of inoculation, as it were.

In order to destroy these organisms and to keep them at bay also, as they come floating through the air, as well as to guard against the risk of inoculation when the wound is touched with anything, surgeons now use disinfecting agents, and notably carbolic acid, when dressing wounds. One device is to throw, by means of an "atomizer," a fine spray of diluted carbolic acid upon the wound while dressing it. So too, the sponges used for washing wounds are soaked in the same liquid, as well as the bandages and dressings; and, in addition to these precautions, care is taken to protect the wounds from all unnecessary contact with the air. Carbolic acid is freely used also for cleansing all kinds of surgical instruments and apparatus before use; the idea being to destroy any and all germs which may have attached themselves to the implements. In cases where so powerful an agent as carbolic acid is inadmissable some milder chemical, such as a solution of borax, for example, is substituted.

Now the question of preventing the spoiling of milk, cheese, butter, flesh, or what not, is a problem of the same general order as the foregoing; and although carbolic acid is manifestly not a good agent for the farmer's purpose there is every reason to believe that there are many chemicals which would serve him admirably well, much better, for example, than the time-honored salt which now takes precedence of all things.

Yet again, the methods employed by physicians for preserving anatomical and pathological specimens point most emphatically to the conclusion that analogous methods for preserving food must eventually come into general use. A considerable number of disinfectants have approved themselves to anatomists and the practice of dissection has been not a little simplified by their use. At the agricultural schools, for example, the horses and other animals that are to be dissected by the students are prepared for this purpose by pumping into their veins, immediately after death, mixtures of glycerine and carbolic acid with the addition in some cases of arsenic, or alum, or the like; and it is found that the flesh of animals thus treated remains sweet and soft for months. The effect of these preservative materials is so eminently satisfactory for the purpose in hand, that it is impossible to escape the conviction that in the near future some of them, or agents of similar character, will come into practical use for the preservation of flesh for food. Indeed many things have been proposed already, and they are now on trial in some sort, but it will be seen at a glance that much more study, and more careful and more extended experiments

are needed in order to prove that a disinfectant is worthy of being used upon food, than will serve to teach the anatomist from mixing a dozen different chemicals, any, or all, of which may be poisonous; and he cares but little which of them preserves the flesh so long as it is preserved to his liking. But in cases where the preserved flesh is to be used as food, careful and long-continued research must be made with each and every chemical put upon it, in order to be sure that it is innocuous.

One of the plans which have latterly excited some attention, viz., the pickling of meat with a mixture of boracic acid and alum, has been carefully studied in this country by Endemann, who finds that the use of boracic acid can hardly be considered as involving any new principle. He esteems it to be merely a variation of, and by no means an improvement on, the time-honored method of pickling with vinegar. By using other acids instead of the boracic, he obtained the same results that were got by means of it; and he finds, indeed, that the preservative power of the boracic acid really depends on its action upon phosphates naturally contained in the flesh or other material treated with it. It is an acid phosphate produced by the action of the boracic acid, which is the real preservative agent, and unless phosphates are present the boracic acid does little or no good, whence it appears that this use of boracic acid is really a roundabout way of applying acid-phosphates, and in point of fact Endemann's best results were reached by using phosphoric acid, either by itself or admixed with muriatic acid. Many of the acids are powerful disinfectants, in that they kill the bacteria, whose presence would cause decay. By special trials, Endemann found it very difficult to develop bacteria in a fluid that contained acid-phosphates, and on adding one part of muriatic acid to 64 parts of a liquid charged with bacteria the latter were completely destroyed. The only peculiarity recommending the use of boracic acid is its insipid taste and the insipidity of the acid phosphates which result from its use. But since boracic acid is neither contained normally in foods nor in the animal body, the propriety of using matters preserved with it continually for long periods may well be questionable, although experiments have shown that they are harmless at first. The last point well illustrates the difficulty of determining offhand whether or not a new process of pickling or preserving is to be heartily commended. The real test of excellence is long-continued use, and it is precisely this kind of evidence which the new candidate—no matter how worthy—cannot possibly offer.

THE WATER FAMINE AND THE REMEDY.

ALL over Western New York hundreds of wells and springs are entirely dried; the ponds and streams were never before so very low; but, judging from the reports in every paper I pick up, ours is no exceptional case; the inquiry on every hand is "What are we going to do for water?" When we consider that all food to be assimilated by the animal system must be in the form of liquids, and that at least 70 to 75 per cent. of the whole animal is water, we shall see that to be healthy, contented and thrifty, a full supply of water is as essential to all farm stock as good food. Especially is this the case in Winter when their main supply is dry food, and it is doubly important if we have not an abundance of some green food such as swedes, mangels or carrots. However rich and nutritious the food, we must have water as the solvent and agent for introducing it into the system.

Although so very important, yet how very deficient most farms are in their water supply! Even in our very best farming regions it is no very uncommon sight, in connection with a fine mansion and extensive barns costing thousands of dollars, to see the stock driven to some half-dried pond or stream, often far away from the barn, to get a scanty supply of half-frozen, dirty water, and this only once in 24 hours, causing them to fill themselves uncomfortably with this mixture of water, dirt and ice, and to stand on tip toe shivering for hours before they again get warm enough to try to eat. This is all wrong. No man who expects to make his living by farming can afford to so treat his stock; better by far sell them and the food they are expected to eat than to try to keep them without an abundance of pure water.

But says a farmer sitting near-by, "If you have not a spring or stream so situated that it can be conducted to the barn in pipes, what will you do?" Dig or bore a well sufficiently deep that an abundance of water may be secured. The depth of wells makes but little difference, for by using a good force pump attached to a wind-mill, water in abundant supply for almost any number of stock can be easily and cheaply brought from almost any reasonable depth; a large trough can be placed close-by the well and protected on all sides by saw-dust, straw, or any other non-freezing substance. Fit a cover to the whole top, with a lid or door at one end that can be opened to permit the stock to drink. By having a spout so placed that when the trough is full the surplus water can run back into the well or away in a drain the mill can be run pretty nearly all the time in severe weather and thus no fear of frost need be felt. The better way, however, if the well is on higher ground than barn or stables, is to adopt the following plan:—By its side build a frost-proof room, and in this, or in some other convenient frost-proof place, erect a tank large enough to hold two days' supply of water, and from this arrange so as to have the troughs always kept full; or, what is still better, have water in stables and barns always accessible to the stock and kept as far above the freezing point as possible. Of course, this will cost money; so does a barn and a house, and the whole expense of suitable water arrangements to supply a large farm need not be over $200 or $300, and the investment will pay a good interest in the increased comfort and thrift of stock; in the avoiding of labor of boys and men in shoveling snow and in cutting open the drinking holes, and in the saving of loads and loads of valuable manure that are usually dropped by the road-side or on the ice, to be washed away and lost in the Spring floods.

I have a wind engine, pump, tank and system of water pipes, carrying water all over my cattle barns, sheep pens, horse barn, into the house, besides hydrants in the flower garden, by the roadside, in the barn-yard and in the orchards, supplying an abundance of pure water for all purposes. It has been running over three years, and could easily furnish four or five times as much water as it now does, and in all that time it has not cost a cent for repairs. Although my cows in Summer run by the side of a large stream, they always stop at the trough going to and coming from pasture and drink heartily, seeming to like the tank water much better than that from the stream. My whole apparatus in position cost less than $350, and I would not now do without it for ten times that sum.

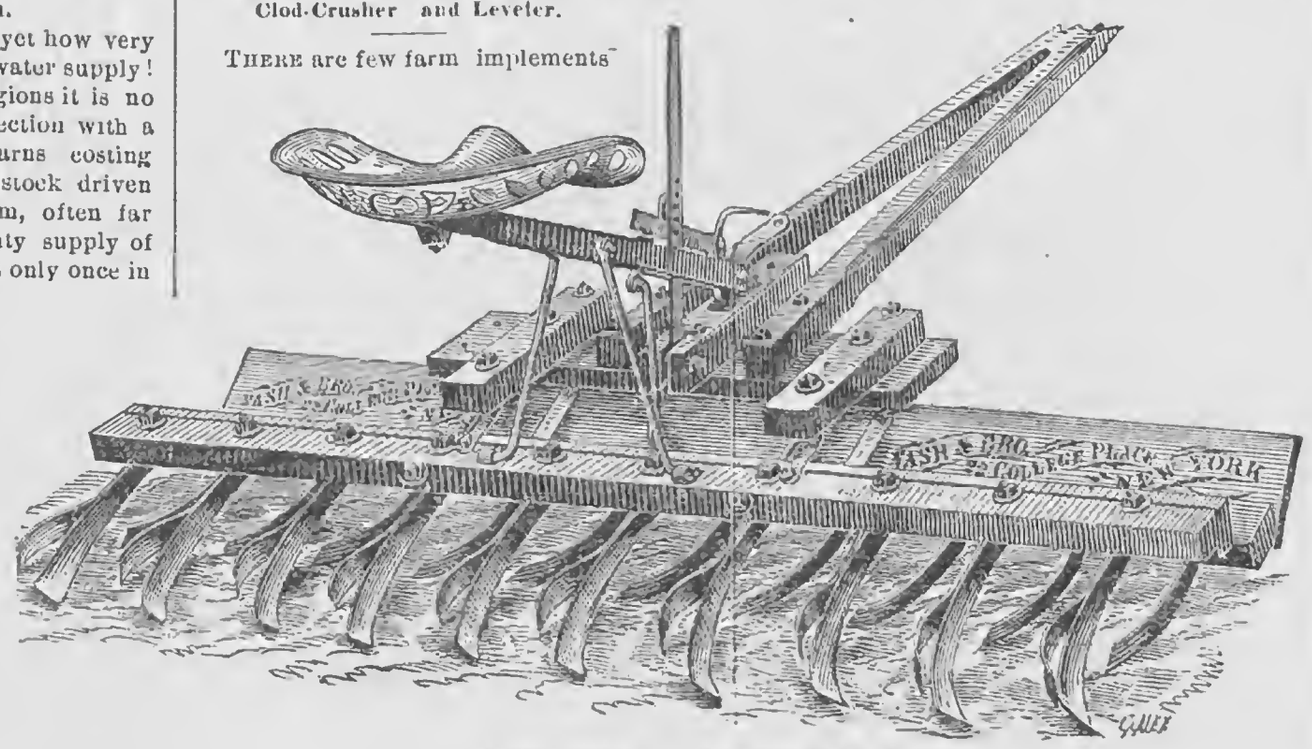
It is surprising to me that so few farmers—and some of them worth thousands, too—avail themselves of this very cheap and reliable means of water supply when they cannot but know how much of their success with stock depends upon their having plenty of pure water. In building barns they often incur more expense for a cupola and other extra trimmings than it would cost to secure a never-failing supply of water. I am not opposed to their making their barns look finished and nice, but I am opposed to their stopping short of securing so necessary a means to their full success in stock keeping and stock feeding. There may be, and undoubtedly is, a great difference in wind engines, but almost any one is much better than none, and will give all the water needed at a very moderate cost, and will pay over and over again in the improved condition of stock and in the saving of wear and tear of muscle, and patience. To save answering many inquiries, I will just say mine is the Iron Turbine, made by Mast, Foos & Co., of Springfield, Ohio, and if not the best engine made, it is good enough for me. J. S. WOODWORD.

Industrial Implements.

ACME STEEL PULVERIZING HARROW,

Clod-Crusher and Leveler.

THERE are few farm implements which have been so greatly improved as the harrow. What in the youth of an elderly man was still a crude contrivance which did laboriously and imperfectly its narrow line of work, has since been made by study and skill an efficient device for accomplishing easily and economically a much wider round of farm work than could have been attempted with the old-fashioned machine. In their eager search for improvements in this as in other implements, inventors have followed various lines of thought and consequently have reached various results, differing more or less from each other; but all which have embodied genuine merits have met with popular favor, the measure of their excellence being guaged by the extent of their favor with the public. However strong the claims put forth by the inventors and manufacturers of various machines, the real test of their economical efficiency lies in the degree of appreciation they have met with from the public, and judging by this criterion alone, the Acme Harrow now holds a foremost place among such implements. Early last year we described this harrow and from a careful examination of its construction and the highly complimentary reports made of its efficiency by a large number of farmers who had practically tested its merits in various parts of the country, we predicted a wide popularity and large sale for it. The event has justified our predictions; for it is now in use all over the country. To the fast decreasing number of those who do not know its merits we may briefly say that it is an efficient pulverizer, clod-crusher and leveler combined. As seen in the accompanying cut, fig. 98, it consists of an adjustable, diagonal leveling bar and clod-crusher, permanently attached to the pole, and provided on its rear edge with a series of steel coulters. To the leveling bar is hinged a tooth bar provided with another series of steel coulter teeth, curved and beveled to a sharp edge. The peculiar form and arrangement of these coulters give great cutting power while at the same time they lift and turn the soil which is, in turn, subjected to the action of the crusher and leveler and to the cutting, lifting and turning action of double rows of steel coulters. A seat is provided for the driver and a lever within his reach enables him to control the position of the crusher and at the same time to raise or depress the coulter so as to regulate the depth of the work, which varies from a light surface working to a complete pulverization to a depth of three or four inches. The machine is made of the best materials and in a thoroughly workman-like manner; is light, durable and cheap, and from all we have heard with regard to its efficiency, we can strongly recommend it to our readers. Full description, etc., will be promptly furnished by the manufacturers, Messrs. Nash & Bro., 22 College Place, N. Y. G. E. B.



ACME STEEL PULVERIZING HARROW.—FIG. 98.

Miscellaneous.

A Scientific Farmer.

Oh, my! what a natural curiosity he'll be some of these days. Now my idea of the scientific farmer of the future—for the tribe does not yet exist—is, that he will be a man of common sense, of an inquiring mind, bound to have a reason for everything he does, eminently practical, and great on applying to his land and the treatment of his crops, stock, etc., etc., the pure and unadulterated result of his scientific knowledge. He will read abstruse works by closet philosophers, blow away the chaff which always envelopes their ideas, and apply the facts to practical use. He will utilize their hints and lucubrations far better than they could possibly do themselves; for a philosopher, my friend, is a being whose brain is in such an agitated condition that unless he has a "matter-of fact man" at his elbow to act as a separator, his ideas and his chaff would all scatter to the four winds together. Mere brute strength alone nowadays will not extract a living from the land; there must be some positive, absolute truths and facts known, and there must be discernment enough in the farmer to select and apply them. When that is done by any farmer, he becomes scientific. This term, at present among the majority a term of derision, will some day be the most honorable handle to a farmer's name, and "Sci. Far." will indicate a man who has won his honors by cultivating his brain as well as his broad acres. S. RUFUS MASON.

Dodge Co., Neb.

RURAL BRIEFLETS.

THUS writes our friend Mr. Richard Goodman:

"The agricultural community, interested in animal portraiture, has become doubly indebted to the RURAL NEW-YORKER of late. First, because of its most praiseworthy enterprise in giving the American public portraits of American animals, and, second, because of the admirable qualities in these portraits. Your artist has shown a power as unusual as it is important, of preserving not only the individual but the breed characteristics in each of his pictures and at the same time making them enjoyable works of art. He shows us not only a pleasing, natural, life-like picture of a bull, but it can be seen at a glance whether it is a Jersey or a Holstein, or a Durham bull, and, finally, if the observer is acquainted with the particular animal represented, he will immediately know that it is "Ned" or "Sir John" who stands out on the page before him. I know of no series of animal portraits in which the artist, with black and white only, has marked so distinctly and satisfactorily the *race* the *breed* and the *individual* characteristics.

In this department of animal portraiture, you at present, certainly stand "first, and without a second" in this country, and the foreign agricultural journals have already much to learn from the RURAL NEW-YORKER.

Let me take this occasion to express my high sense of the value which your paper derives from its connection with the Rural Experiment Farm. It is of course of tenfold value to the community having the paper for its mouthpiece; and certainly the paper, like the old giant Antæus, draws new life and strength and power for good from its frequent and close contact with mother earth. The RURAL NEW-YORKER occupies a place in the community as unique as it is important." . . . . . .

WE have received the following letter and appended printed circular:

"I want to get some of that Chester County Mammoth Corn for the trade. I want your price also, and one of the largest and longest ears. I inclose circulars showing two kinds of seeds which I handle; think I can sell your corn. Perhaps the Rural Farm might want some of my seed. Please let me hear from you. J. A. FLETCHER.

Oneida Co., N. Y.

The circular, with unimportant parts left out, is as follows:

CUZCO OR GIANT FLOUR CORN.—This wonderful and famous corn has attracted great attention and caused universal wonder, owing to its size and quality, the grains being soft and full of flour. The grains in size are from three to four times the size of ordinary corn and look like small, well-baked crackers. This corn is raised by the Indians in the province of Cuzco, situated 450 miles from the sea, and having an elevation of over 12 000 feet. The climate in Winter, which is very long, is severe and cold, with heavy snow. The Summers are short, cool and temperate.

The yield of this corn is unquestionably many times greater than that of any other known variety. In the cold latitude of Minnesota it is reported that a farmer raised from 20 hills, 80 pounds of shelled corn. If such reports are true this new variety will soon be very generally raised in all the corn-producing States and stand at the head. This corn is a rapid grower in our warm soils, growing to the hight of 15 feet, with two fine, well developed ears on nearly every stalk, which measure from 12 to 16 inches in length and from nine to 11 inches in circumference after the husks have been removed. Notwithstanding its mammoth proportions it matures equally early as ordinary dent corn, when planted at the same time, as is reported by those who have seen it grow, and it ripens in four months from the time planted. The grains are a solid of pure flour, with a thin coating of bran. As food for stock it is superior to any other variety, being soft, rich and easily masticated.

This corn is put up in packages of 50 grains each, which will plant 25 hills, four feet apart. Two grains are sufficient for each hill. Fifty grains will give a yield of nearly 100 pounds of shelled corn. I will send one package by mail, post-paid, to any address on receipt of price, $2 50 a package. For special rates and terms to agents, as well as for seed, address

J. A FLETCHER.

We are willing to presume that Mr. Fletcher has been deceived—especially as he seems to be a reader of the RURAL NEW-YORKER. He must, however, have overlooked what we have said respecting this "wonderful and famous corn," not only from our own trials during two seasons, but from trials made in several different parts of the country from seeds which we mailed to friends. If heavy stalks are wanted with few leaves—then the Cuzco will suit. For grain it is not adapted to any part of this country and, indeed, so far as we are informed, it produces very small ears and few of them when cultivated in South America. . . . . .

WE have received the following note from our respected friends, Messrs. Smiths & Powel of Syracuse, N. Y., touching upon our engraving of the handsome Holstein Bull "Ebbo:"

"We were surprised to see yesterday in your paper the cut of "Ebbo." We regret that you published it, for we consider it a perfect burlesque of the bull, and while no doubt you intentions were all right, we consider it a damage to us to have it published, and you will remember we expressly requested you

not to publish it. It was a miserable photograph in the first place and the cut looks like a monstrosity rather than a fine animal as he was." . . . . . .

We have received the following which explains itself:—

Dear Sir:—The first number of the journal of the A. A. A., is now in preparation and will be furnished free of expense to all who join the association. It will be in book form of three to four hundred pages, and will contain articles by the ablest writers in America and Europe on agriculture and kindred topics, together with the proceedings of the association, the constitution and by-laws and other interesting matter. The association has been regularly incorporated, and is in excellent working shape, free of debt, with its Life Membership Fund intact. Soliciting your very best and prompt efforts, Yours very truly,

J. H. Reall, Secretary.

P. S. Annual dues for this year $2.00, covering all expense.

The following interesting letter from Mr. Robert Douglas, of Waukegan, Ill., in reply to our questions, has been overlooked for a considerable time. It is, however, as timely now as then to most of our readers:—

Eds. Rural:—I know of no tree that can be so easily made to grow as the Catalpa. It is not however, so easy to grow it from the seed, or, rather, to get the seed started, as it is very liable to bake in the ground if this is not very mellow and loose, and loose ground dries quickly, in which case the seed fails to germinate. In my opinion, no other tree is better deserving of distribution anywhere south of 43 degrees. It is valuable and must become popular. Dr. George Engelmann wrote me that he has thoroughly examined the tree, and is ready to publish it as a distinct species, and proposes that it retain the name of Speciosa, as named by Dr. Jno. A. Warder 26 years ago. Dr. Warder had only claimed it as a variety at the time he named it. Some of our Eastern friends who have not had an opportunity to examine both kinds seem to doubt there being any difference in the two sorts, either in hardiness or otherwise; Dr. Engelmann sets that matter at rest by describing two distinct species, and as there could be no higher authority, skeptics will now feel disposed to examine into it more closely. The difference in hardiness is patent to any one who will look into the matter, and the difference in appearance is altogether in favor of the Speciosa. Dr. Warder and I examined the Bignonioides in Boston, New York and all along to Washington and found that the further south it grew the better it looked; but it was nowhere fit to be compared with Speciosa as an ornamental tree, and the flowers of Speciosa are much finer than those of Bignonioides.

What Others Say

Mules.—The Agricultural Editor of the New York World has this (and we fully indorse it) to say about mules: The chief objections urged against mules are two in number, and these have proved sufficiently strong to keep the animals from becoming universally popular. Their appearance is unprepossessing, and they are unpleasant to handle, owing to nimble and vicious movements of their hind legs. Concerning their kicking propensities the prejudice is gradually disappearing before an intelligent understanding of their disposition and management. Planters and trainers of large experience contend that the kicking propensity is due mainly to ill treatment, and that mules bred from parents of good temper—if kindly handled and broken when young—are but little, if any, inclined to this vicious habit. The average life of a mule is about 30 years, and many perform good service at a more advanced age. Mules mature earlier than do horses and in addition to their powers of endurance are as sure-footed as goats. They are excellent pullers, and when judiciously handled are admirably adapted for teaming and farming. The peculiar formation of their hoofs exempts them from many of the diseases of the feet to which horses are subject. Their skin is less sensitive to the bites of fleas and other insects, and they can endure great extremes of heat and cold.

Carp.—The New York World, in an article upon this fish which is now exciting so much interest, says: "Carp spawn in May and June, and, under some circumstances, throughout the entire Summer. They are very prolific and the eggs of the female adhere tenaciously to whatever they touch; for this reason it is important that a new pond be provided, with floating weeds for such attachment. The eggs hatch out in a few days and the young grow very rapidly. A Nevada exchange, in illustration of the prolificness of carp, cites the experience of Mr. Moshier, of Stockton, who from 17 young carp gained in one year 5,000 carp from five to seven inches long. His pond was 70 feet in diameter and six feet long. The bottom and sides of the pond were cemented to render it water-tight. The water was supplied from a well 70 feet deep; it was pumped into the pond by means of a windmill. The cost of this pond was $100. Farmers who feel interested in growing carp can, of course, raise all that would be required for family use in a much smaller pond than the one described."

Said Mr. Beal in an address before one of the meetings of the Farmers' Institute of Michigan:—"If our grandmothers of fifty years ago were here to-day and I were to tell them that we were making great improvements over their methods of making butter, they might justly refer me to the tons of sueine or lard-butter manufactured in Chicago, and the seven million pounds of oleomargarine sent abroad from New York City within the past year and palmed off on the unsuspecting public as pure butter. They might say to me that if our butter was so poor that it could not be distinguished from lard or tallow, they did not think we had improved much on the quality. But I could answer them that it was not that our butter was so poor, but that Yankee ingenuity had so perfectly imitated the genuine article by the manufacture of spurious butter. Butter is not the only commodity that is counterfeited.

The closing remarks of the above meeting were made by Thos. F. Moore. The speaker aimed to point the way to a higher elevation in the social and intellectual scale of the large class engaged in the noble industry of farming. Education was the great lever. He suggested three practical ways for the better intellectual and material advancement of the farming community: First, better district schools, by giving women a voice in their management; 2d, by the establishment of graded schools in every town; 3d, by the admission of farmers' daughters into the State Agricultural College. These were privileges farmers might enjoy, and it was their duty to secure them. Among other duties was the eradication of the liquor traffic, to be brought about by giving the ballot to woman; and the regulation of railroad transportation rates, to be achieved by sending farmers to Congress.

Hot beds.—Instructions for hot-beds have been given in these columns so many times that we had intended to omit them the present season. Mr. I. F. Tillinghast, however, gives the following instructions in his little work, "Seed-Time and Harvest," which are notable for their simplicity and accuracy:—

Manure beds are most commonly used, horse manure being preferable to any other readily available substance. Fresh manure recently removed from the stable is best, but if it is made in too small quantities it should be frequently spread through the Winter in order to keep it from heating and spoiling before Spring. If a good proportion of fine straw or forest leaves are used in the bedding it improves the manure greatly for hot-bed purposes. When ready to begin operations the manure should be forked over, shaken out finely, and thrown into a high conical heap to heat; if anyways dry it should be watered until well dampened throughout the heap. Leave it standing in this heap about a week and it will surely heat and begin smoking like a small volcano.

There are now two methods for forming the bed, some digging a pit and sinking the manure in it, and others simply building the manure up into a square bed and setting the frame on it. The first-named method requires more labor, the second more manure; so we will let labor vs. manure decide which shall be adopted. After leveling the manure there should be three or four narrow boards laid across it, on which to rest the hot-bed frame, so that after the manure heats all will be settled together evenly, otherwise the weight of the frame and sash will force it down into the manure, and the center of the bed will appear to raise and perhaps displace the plants. Of course, a spot for the bed should be selected which is sheltered as much as possible on the north and west by some building or high board fence. The sash should slope gently towards the south or east, both in order to carry off the rain water readily and to catch the sun's rays and gain light and warmth.

The most common sashes are 3x6 feet. The frame should therefore be made six feet wide and as long as necessary to accommodate the number of sashes to be used. A vital point always to be observed in making a hot-bed is to spread the manure down while hot; it then continues to heat; but if spread down cold it will heat very slowly and unevenly, or perhaps not at all. Early in Spring, when considerable cold weather may yet be expected it will be necessary to use about a common wagon box full of manure to each sash, but later in the season, when forming beds in which to transplant seedlings, one-half that quantity will suffice. The soil to be used should be prepared in advance. It must be light, loose and rich. Good sods placed in a heap with alternate layers of cow manure and allowed to stand and decay for about one year, make a fine compost for starting a hot-bed.

Soil should be placed on the manure to the depth of from four to six inches, and the glasses adjusted properly. After the soil becomes warm, sow the seed in rows about four inches apart and scatter them quite thickly in the rows. Never sow broadcast, as the labor of keeping free from weeds is much greater. When the seedlings are about three inches high, they should be transplanted into rows, say 3x6 inches, and as soon as these need more room or are in danger of running up spindling, transplant again.

In transplanting tomato plants, the stem should be set down well into the soil, and will take root wherever covered. The object sought is plenty of fibrous roots on a short, stocky stem.

The temperature of the beds must be closely watched, though it may vary considerably. The mercury may run from 50° to 80°, though the mean, 65°, should be as closely kept as possible. This for tomatoes, peppers, etc. Cabbage and cauliflower plants require much less heat and should never be placed in the same bed with tomatoes. In fact, very little or no bottom heat is required to produce good early cabbage plants. Fit a frame as for a hot-bed except to omit the manure for the bottom heat; cover it with sash and sow the seed in February, or early in March, and better plants will usually result than if bottom heat is used.

We find the following in the Mark Lane Express (London):—"Another equally incredible record is that of the cow Eurotas, the property of Mr. A. B. Darling, a New York hotel keeper, which is stated to have given a yield of 778 pounds of butter in a little over 11 months; and almost a similar marvelous result is claimed for another cow, which is said to have produced 705 pounds of butter in a year. The milk of the cow Eurotas is said to have been so rich as to have yielded an average weight of one pound of butter from nine and a half pounds of milk, whilst it takes from 23 to 25 pounds of good average milk to produce one pound of butter. One motive for the promulgation of these astounding records appears to be the enhancement of the value of calves from these marvelous cows. As the Rural New-Yorker remarks:—'Before we should pay $1 500 for a calf, it would be at least safe to know that the record is genuine, and free, not only from fraud, but also from too enthusiastic figuring.' We do not think the reputation of American dairy farmers for truth and honesty can fail to be injured by what is at present occurring in that department of American industry. Whilst oleomargarine and bosch butter of American production are poured into our market, cheese, as we read in last week's paper, is being concocted of sour skim milk and animal fat, and gross falsehoods are circulated as to the produce of individual dairy cows." Again it remarks, with forcible truth: "Those stock owners who undertake the trouble of accurately registering the yield of individual cows in milk or butter, under varying circumstances, as to feeding, etc., and who give to the public the result of their labors, which may often prove of practical value, are entitled to our thanks; but those who, from the vulgar desire of telling the biggest tale, or a wish to increase on false grounds the demand for their cattle, give to the public exaggerated, false, or misleading statements, with a deliberate intention to deceive, are only worthy of contempt." The Rural thinks that "right here" a strong word might also be said against the "high-spiced" portraits which appear in illustrated stock journals from time to time.

Application of Liquid Manure to Roses.—Mr. George S. Wales tells of an experiment he made last season which proved highly satisfactory. About June 1st he planted out 12 small sized plants of different varieties, about a foot apart each way, in rich, heavy soil. After every heavy rain he took from the barnyard the leachings of the manure pile; with a pointed stick he punched four or five holes in the ground a few inches from each plant, and poured in the water; the next day, or as soon as the ground was dry enough, he stirred the surface with a hoe, and kept it loose by frequent hoeings until again watered during the season. He applied the liquid manure probably eight or ten times during the season. The result was wonderful. They began in five or six weeks to bloom, and until October 1st, when they were taken up, there was hardly a day but that beautiful buds might have been picked.

How Little Food a Plant Requires.—There hangs before me as I write, says Prof. S. W. Johnson in the N. Y. Tribune, a wheat plant raised from a kernel of the "Michigan Southern" variety, which was planted January 1, 1877, in a bottle of solution containing to one gallon of pure water the following substances and quantities: 45 9 grains of muriate of potash; 9 5 grains of sulphate of magnesia; 18 6 grains of phosphate of soda; 88 9 grains of nitrate of lime, and a few drops of a solution of muriate of iron. The plant was harvested July 2, 1877. It tillered well, and had some dozen ear-bearing stalks, and ripened 62 fairly formed and plump kernels. It is found that such solutions *must be very dilute* in order to obtain a vigorous and abundant growth. In this instance the gallon of solution contained 58,385 grains of water and 163 grains of the above-named salts, or 1,000 of water to somewhat less than 3 of salts. Experience in this kind of culture has demonstrated that if the proportion of salts be but slightly increased, the result is a diminished growth. In most cases two or even one part of the suitable salts to 1,000 of water give the best results. With our usual grain crops four or five parts to the thousand would greatly hinder, and ten parts would be nearly fatal to growth.

At the late meeting of the Pennsylvania Fruit-Growers' Association an experiment was stated showing that Paris-green, in solution, syringed over a bearing apple tree, entirely destroyed the codling moth. It was shown that when the fruit was ripe all traces of the poison had passed away, and consequently no danger could ensue from its use. However, as there is a likelihood of this application proving dangerous, the suggestion was made to substitute other ingredients in its place, as, for instance, pyrethrum powder, which, although fatal to insects, is innocuous to the human family.

The N. Y. Tribune, in answer to a question, says that 123 pounds of the corn-fodder must be given to supply the same nutriment as 100 pounds of hay would contain. This may be considered as a fair approximate statement of the relative value of the two fodders, based on their chemical composition; as to statements of relative value based on experiment or experience, they are exceedingly scarce, while there is an abundance of testimony to the effect that corn-fodder is very valuable for Winter feeding.

Apples for Missouri.—We commend Prof. Husmann's list of apples for Missouri—ten for Winter, five for Fall and five for Summer:—

Winter.—Huntsman's Favorite, Ben Davis, Lawyer, Winesap, Jonathan, White Pippin, Rawle's Janet, Willow Twig, Missouri Pippin, and Small Romanite.

Autumn.—Grimes's Golden, Maiden's Blush, Fulton, Fameuse, and Rambo.

Summer.—Williams's Favorite, Lowell, Red June, Red Astrachan, and Early Harvest.

The editor of the Industrialist, published at the Agricultural College at Manhattan, Riley County, Kansas, under date of January 1, 1881, has the following to say of the "Grange Store" in Olathe:—"While at Olathe last week we became much interested in the co-operative Grange store of that place. This institution commenced business four years ago, with less capital than $1,000. It now does an enormous cash business, which it shows by the fact that during its existence it has divided net profits among its stockholders amounting to $28 000. The secret of this great success seems to be the strict adherence to the cash system, a very fortunate selection of the manager, and the existence of a wide-awake farming community about Olathe."

It is all very well to talk poetically about the slender thread of fate, but the ugly truth is that a man's fate generally depends upon the number of hours of honest work he puts into every day. . . . . .

It is truly said that there is only one way not to get cheated in a horse trade, and that is not to buy the horse. . . . . .

Dr. Boynton calls ensilage "Cow-krout. .

The Toronto Globe mentions a dairy where the churning power is supplied by a black bear of 100 pounds weight, which seems to really enjoy the treadmill and always when the butter comes gets a pan of milk as reward for his faithful tramp. It would be a good idea to reward other animals used for the same purpose in the same way. . . . . .

It was very hard on a celebrated physician to say that when he went hunting during his holiday it was the only time in the year when he didn't kill anything.—N. Y. Herald. . .

Erskine uniformly answered all begging letters as follows:—"Sir, I feel much honored by your application to me, and I beg to subscribe (here the reader had to turn over the page) myself your obedient servant." . . .

Mr. Pierson is proud of his own great State of Michigan. "Though younger than her sisters, she is now a grown and beautiful girl. She is withal a thrifty, prudent girl; keeps money in her pocket and is always ready to pay her debts. . . . . .

We see by the Michigan Farmer that Mr. Hiram Sibley owns the largest farm in the world, viz., 40,000 acres situated in Ford Co., Illinois. Mr. Sibley is now past 70 years of age though still energetic and in fine health. .

Prof. Husmann of the Rural World speaks of Green's Golden as a new seedling grape of deep golden, almost bronzy tint. He thinks it will prove a fine grape for family use It is a great bearer, very healthy; berry as large as the Concord, sweet, juicy and fine flavored. .

Mr. Boardman of the Home Farm (Maine) tells us a Mr. Burleigh is expected back from England the present month with a choice herd of the Aberdeen or Polled Angus cattle.

CATALOGUES, ETC., RECEIVED.

Proceedings of the Inter-State Agricultural Convention held at Springfield Nov. 30 to Dec. 2. J. K. Hudson, Topeka, Kansas, Secretary.

Everywhere.

RURAL SPECIAL REPORTS.

ALABAMA, South Lowell, Walker Co., Jan. 28.—The cotton season is about over. Owing to the continued wet weather, much of the staple was picked wet, and consequently much of the seed has heated and is spoiled for planting, and possibly a poor stand will be the result of next planting. B. A.

CANADA, Listowel, Perth Co., Feb. 1.—Very little can be said about the prospects here. There was a large acreage of wheat sown in the Fall and a moderate growth was attained, but not like the year before. The snow fell early and the ground has been well covered since. The farmers are doing more logging than for many Winters previous and prices for farm products being good, they are in good spirits and doing well. A. J. C.

CONN., South Glastonbury, Hartford Co., Jan. 31.—The extreme cold of the past month has severely tested the hardiness of our raspberries. The only varieties that have escaped are the Turner and Caroline, they showing no signs of injury. Brandywine, Cuthbert and Doolittle are badly damaged, but not entirely killed. All other varieties—some 15 in all—are killed to the snow line. Peach buds all right so far. The thermometer was 32° below zero here on the morning of January 1st and 10° below on the 24th. J. H. H.

ILLINOIS, Villa Ridge, Pulaski Co., Jan. 31.—The lowest temperature here was 6°. The snow has protected the strawberries. Young peach stock is badly damaged. There will be very few white and yellow peaches, while the red ones are nearly uninjured. I planted a half peck of Blount's corn first of June '80, three kernels to the hill, and in spite of a drought just as it was tasseling and shooting, with no extra cultivation, no manure, have harvested 37½ bushels of shelled corn. Average number of ears to a stalk, three and four, although quite a number had seven and eight ears and a few had nine. I consider the Corn Number invaluable. H. R. W.

ILL., Ludlow, Champaign Co., Jan. 24.—We have had steady Winter weather, without much variation for a couple of weeks, thawing little neither freezing hard. With a drizzling rain on the 18th, and since then signs of snow nearly every day but none falling to speak of. Roads good. Corn 30 cents; oats, 28 cents; live hogs, $4 25 per cwt.; butter, 18 cents. A. M. G.

MINN., Hawley, Clay Co,, Jan. 30.—As the weather and the amount and kind of crops produced in any section of country are always interesting to farmers, I will give you a few items. We have had steady cold weather with but little wind and snow. It has been very comfortable compared with what we sometimes get here. Wheat is our main money crop, but this year it was hardly up to an average yield. I hear of some who had 30 bushels per acre, while many others did not have half that amount. The trouble I believe is in poor farming, or in trying to cultivate too much land, and in many cases the seed is not adapted to the soil. Oats have been a good crop here; so has barley although there is but little of that grown. Potatoes were small and few in the hill; corn is but little grown; but let us get our land in good tilth and I see no reason why it will not do as well here as in northern New England. We have good success with cattle, and they must here, as every where else, be the foundation of successful farming. Our pasturing is practically unlimited. Hay of an extra quality can be put in the stack for two dollars a ton, and with our large straw piles for the cattle to run to, it will not require more than a ton and a half per head, to winter an average lot of cattle. Wheat is worth 80 cents per bushel; oats, 30 cents; barley, 45 cents; butter, 25 to 30 cents per pound. J. H. B.

N. J., Titusville, Mercer Co., Feb. 1.—Peach buds are nearly, if not quite, all destroyed, so that the peach crop must be very light in this section. I. J. B.

N. Y., Clinton, Oneida Co., Jan. 28.—The first cold snap, about December 1st, killed peach buds and all the cherries, except Early Richmond and other sour varieties. Trees are not injured. They went into Winter with wood well ripened, which is the all-important point. The cold of December was more fatal to buds from the dryness of the atmosphere. E. P. P.

N. Y., Himrods, Yates Co., Feb. 3.—We are having a fine Winter, with good sleighing. The cold has not hurt the buds yet; 13° below zero is the coldest it has been here. We are in need of water, as many wells are dry. Hay is scarce and straw is being fed up. Most farmers are selling off all the stock they can in order to winter through. G. A. B.

N. Y., Eddytown, Yates Co., Feb. 1.—February starts out right royally for Winter. The thermometer has stood at 3° to-day, and towards night is falling. We have had the finest run of sleighing I ever knew—snow enough for a good run and yet not enough to make it bad getting about in the fields and woods, and but a little drifted. I have examined only a few peach buds, but I find them nearly all killed. It was in a severely exposed locality. Other fruit I have not examined; I might say grape-wood is in good order. W. H. O.

OHIO, Garrettsville, Portage Co., Feb. 1.—Stock is doing well. Last season crops of all kinds were better than the average except potatoes which rotted badly. R. H. B.

PA., Pughtown, Chester Co., Jan. 29.—The weather has been very cold here, and the ground has been covered with snow since December 21. Ice is 15 inches thick. All the ice houses in this vicinity are filled. Our hay crop was a light one, but the rest of the crops were good. Wheat brings $1.10; rye, 70c; corn, 58; oats, 35; potatoes, 75; apples, $1.; butter, 35c; eggs, 38c; chickens, 13c. Hay is worth $20 per ton and hard coal $5. H.

VIRGINIA, Naffs, Franklin Co., Feb. 2.—We have had cold and snowy weather for five weeks. Dec. 20 snow fell to the depth of 17 inches and the thermometer dropped from the freezing point to eight or ten degrees below zero for several days. It has snowed to the depth of three or four inches several times since. Alternate freezing and thawing, snowing and raining have been the programme. The ice harvest has been bountiful. No farm work of any consequence has been done since Christmas and for once we miserable farmers could do nothing but get a little firewood, attend to our chores, eat our hash, toast our shins, burn our boots, read the dear old RURAL and all the other papers we could get. A word here for the RURAL. I candidly believe that, if each family in the U. S. would take it and read it, we would be a much better and happier people. Stock of all kinds are wintering badly, even with extra feed and care. Owing to very late seeding, wheat is looking very bad. The prospect is the poorest we have had at this season for several years. Wheat is worth from 90c. to $1.00 per bushel; corn, 40 to 45c; oats, from 33 to 35c; green apples 75c. per bushel; pork $5.50 to $6.00 per cwt; beef $3 50 to $5 00. Horses very low. Butter 15 to 25c. per pound; eggs, 20c. per doz, potatoes dull. J. W. N. & BRO.

VT., Newport, Orleans Co., Feb. 7.—We have had 75 days together now without a drop from the eaves. Thermometer, to-day, 25 degrees below. T. H. H.

The Querist.

ANSWERS TO CORRESPONDENTS.

Manure Against Humus.

M. Y., Cincinnati, Ohio, asks whether commercial fertilizers or manure will furnish the humus in the soil which authorities state are "necessary and indispensable to vegetable growth, if it can be supplied to the soil in that manner, can it also be supplied through liquid manuring; would not liquid manuring be more available? Being in a soluble state, would not liquid manuring, other things being equal, give as good results as applying commercial fertilizers or manure to be plowed in.

ANS.—Humus, Liebig describes as "*vegetable matter in a state of decay* always containing ammonia in combination." A large amount of this vegetable matter renders stiff soils porous and easily pulverized. It absorbs and holds moisture and is therefore a protection against drought. It furnishes carbon to plants and furnishes the mineral elements of plants in a soluble form. It absorbs ammonia from the air and holds it for the use of crops. The carbonic acid of humus furnishes a solvent for many compounds in the soil, such as silicate of potash and phosphate of lime, rendering these available to plants. It may be considered a storehouse of plant food, and is a most important part of the composition of a soil.

But our correspondent seems to suppose that there is much soil devoid of vegetable matter, and is querying as to whether this may be replaced by commercial fertilizers which contain all the elements of the crops to be raised. Now, there is very little soil on any of our cultivated farms, however badly exhausted, devoid of humus. The value of humus, where the elements of crops are furnished by commercial manures or farm yard manure, is in its mechanical effect, and as an absorbent. The friability of a soil is important, but with plenty of the chemical elements of plants furnished to the soil in manure, and properly worked into a thoroughly pulverized soil there will be no lack of crops.

As to a judicious use of mineral fertilizers we can refer to Mr. John Prout's practice, on a stiff soil in England, for the last 20 years. This has as little vegetable matter as can be found upon almost any farm in this country. His farm of 340 acres has paid as good a profit as any farm in England for the last 17 years of continuous cropping with no aid save commercial fertilizers; and the crops have been sold off the land—nothing of them is returned to the soil.

He grows immense crops, and has applied from $10 to $13 worth of raw bone dust, superphosphate and guano per acre annually—sometimes applying dressings of potash or sulphate of ammonia. Humus is produced by the decay of vegetable matter, and if Mr. Prout applies the elements to grow his large crops every year, then the roots of those crops are left in the soil as an addition to what it possessed before. His crops are now double what they were at the start of his present practice, which would seem to prove that the humus of his soil has been constantly increasing.

Liquid manure, containing all the elements of fertility, is in the best possible form for application. But this is usually more difficult to handle, and cannot stand transportation. If a farm were so situated as to have liquid fertilizers convenient and cheap, they should be used; and liquid manure will distribute itself more evenly through the soil than in any other form.

But we believe, in this country of cheap land, it is more profitable, generally, to feed animals, and obtain the extra manure by purchasing food, than to pay money for commercial fertilizers. More pounds of nitrogen, phosphoric acid, and potash can be applied in the manure made from one hundred dollars worth of grain, linseed meal, cotton seed meal, and wheat bran fed to animals, than if the hundred dollars were paid direct for commercial fertilizers. And besides this the hundred dollars paid out for food may be received back in the growth or fattening of the animals, and the manure really costs little or nothing. It would extend this answer too long to give examples, but this is the direction that our farming on depleted land should take.

Miscellaneous.

W. H., Salem, N. Y., asks, 1, whether the catalpa and European Larch will prove hardy as far north as Troy, N. Y., and what is their value for posts as compared with chestnut; 2, what kind of locusts are used for posts and where can he obtain the young trees.

ANS.—1, Yes, the European Larch is hardy still further north—in Canada, if we mistake not. It needs a high, well drained situation to do its best. It is probably the most enduring timber we have. Experiments have been made to test the relative powers of this larch and the oak. Posts of each were driven in the water where they were alternately covered with water and then left dry. The oak posts were twice renewed while the larch posts remained almost unimpaired. As to the catalpa, it is thought a Western variety known as Speciosa is hardier than the species (Bignonoides). But, from our best information, it would not prove entirely hardy north of 42 degrees. As to the durability of the wood of the catalpa for posts, as compared with chestnut, unquestionably the former is far more valuable. 2, The Common and Clammy Locusts—Robinia Pseudacacia and viscosa. The first is best because the tree grows larger and the timber is heavier. You can obtain the young trees by planting seeds or from the nurserymen whose advertisements appear in our columns.

E. E. W., Cherokee, Iowa, 1, wants to know what kinds of apple trees to select for northwestern Iowa for Fall and Winter; 2, Is the Lady (Pomme d'api) suitable.

ANS.—The Report of the Western Iowa Horticultural Society for 188[illegible] (Geo. Van Houten, Lenox, Iowa, Secretary) gives the following revised list of apples for that section. *Ben Davis*, Jonathan, Wineasp, Roman Stem, Domine, *Talman Sweet*, Janet, *Iowa Blush*, *Walbridge*, Lowell, *St. Lawrence*, *Fameuse*, Chenango Strawberry, *Cole's Quince*, *Gros Pomier*, or *Haas*, *Red Astrachan*, *Duchess of Oldenburgh*, Early Harvest, Red June, Sweet June, *Sops of Wine*, *Wealthy*, Crabs, Hyslop and Whitney's No. 20. The hardiest of the above list are put in italics. Chenango Strawberry and Early Harvest are probably too tender for the northern part of the State. Lady Apple would also be likely to fail. Meader's Winter is a good substitute for it, and is perfectly hardy.

L. R. B., Benton, Oregon, asks, 1, whether cranberries will grow in a marsh flooded with tide-water, or must it be fresh water; 2, where can good plants be had; 3, how much a thousand do they cost; and how many will be needed to plant half an acre.

ANS.—1. The cranberry meadow must be flooded with fresh water; salt water is destructive to the fruit. For method of planting and cultivation, see RURAL of December 4th of the past year, page 798. 2. Good plants can be had of J. T. Lovett, Little Silver, N. J., but perhaps our inquirer can find them of good quality growing wild in Oregon, or in Northern California; if so, they can be got there. 3 The price varies. It is now $3 50 per thousand. 4. Plant six cuttings, every 12 inches, in drills three feet apart.

A. J. C., Listowel, Canada, asks, 1, whether it is any use to keep old Malvas for blooming; 2, how to make geraniums bloom in Winter; 3, the name of the best book on out-door vine culture, suitable for one who has no previous knowledge of vine culture and who lives so far north.

ANS.—1, We do not know what Malva is referred to. 2, By striking cuttings in August or potting in September. 3, Husman's "American Growing" is as good as any. American News Co.

H. O. B., Poteau, Kansas, asks when is the best time to sow buckwheat for early blooming for bees, and when for late blooming.

ANS.—Buckwheat is a poor honey plant, as the honey is very dark, and so it would seem poor policy to sow it for early crop of honey. It could not take the place of White or Alsike Clover. It blooms about six weeks after sowing, and is usually sown the last of June, so it comes into bloom in August. Bees will work on it two or three weeks if the weather is favorable. It would be well to sow at two or three different dates, at intervals of four or five days, commencing June 15th, and thus prolong the period of bloom.

J. T. S., Fountain, Ill., sends us a lock of wool from an 11-months-old lamb, and asks of what quality is it; whether it is a salable sort, and a good kind for growers to raise.

ANS.—The sample of wool is a coarse delaine wool or a fine worsted wool as graded in the market, and is a salable kind. It seems to be a mixed Cotswold and Merino grade and would be classed as combing wool. It should be a profitable kind to grow, having a staple over five inches long which is very good for a 11-months old lamb.

T. I. E., Pleasanton, Texas, asks whether the newly revised Bible has yet been published, and if so, where can he get a copy.

ANS.—No, it has not yet been published either here or across the Atlantic. As soon as it has been given to the press, several editions will doubtless be given to the public. An advertisement in last week's issue shows that the "Book Exchange" intends to publish two cheap editions.

J. W., Dry Saw Mills, Pa., asks full practical details of the process of taking tobacco from the poles in the shed and packing it in cases or boxes for market, as well as how the cases should be made and of what size.

ANS.—This question will be fully answered in our columns.

J. M. S., Jericho, N. Y., asks how to make factory cheese.

ANS.—The manufacture of factory cheese cannot be explained satisfactorily in the limits of a reply to an enquiry. After this week this subject will be treated fully in the series of articles entitled "The Dairy Cow."

J. C., Mattapan, Mass., asks who offers for sale the new pear, Directeur Alphand.

ANS.—It is this season offered only in France. We have no doubt our nurserymen will import and offer it for sale in due time if found suited to this country.

C. D. M., Wellsville, N. Y., having three tons of bones, asks how to make bone dust or manure out of them.

ANS.—This and several similar queries were fully answered by Prof. E. W. Stewart, in the issue of the RURAL for Feb. 5.

O. S. F., Blackstone, Mass., asks which potato is the earlier—Beauty of Hebron or Dunmore, and whether there is an earlier sort.

ANS.—We were not aware that the Dunmore was very early. Alpha is the earliest potato we know of.

S. S., Aurora, Indiana, wishes to learn where he can get Blount's corn, the white Elephant and other seeds.

ANS.—We refer our friend to the catalogues which from now on till Summer will be announced in our advertising columns.

D. N., Oakville, Washington Ter., sends three kinds of beans for name.

ANS.—No. 1, Dwarf Horticultural; 2, Royal White Riding; 3, Horticultural Pole or Speckled Cranberry.

W. M., Lexington, N. Y., asks whom he should address in sending articles for the domestic department.

ANS.—They may be addressed to Emily Maple at this office.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, FEB. 12.

THE
Rural New-Yorker,

PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, FEB. 19, 1881.

WE may now announce that the SMALL FRUIT SPECIAL of the RURAL NEW-YORKER will be dated March 5th. By small fruits we mean Grapes, Strawberries, Raspberries, Blackberries, Gooseberries and Currants.

THE present Free Seed and Plant Distribution of the RURAL NEW-YORKER will be begun in a few weeks. It is our desire and intention to begin it earlier than we were enabled to do last year. We are now only awaiting the arrival of seed from France, ordered a long time ago. We have already sent out the White Elephant Potato to many, availing ourselves of warm spells. If not received in a perfect condition, friends will please notify us by postal card.

CORRESPONDENTS sending us specimens of fruit, grain, flowers or, indeed, of any kind, will confer a favor by writing their names and addresses in full upon the outside of the package. This is now permitted by the Post-office Department.

IT IS A FACT worthy of some thought that the apple which, through the West is considered the most popular and most profitable for the orchardist—which sells most readily to dealers and to the people, should be one which, to use the Prairie Farmer's words, "is neither fit to eat nor to cook." We refer to the Ben Davis.

AS BETWEEN German and English Chiccory, we learn that our coffee houses prefer the English, but that they import the German because it costs less. The very best article can be sold here for from four to five cents the pound. We do not know why every farmer should not raise his own Chiccory. The quantity of this mixed with ground coffee and often sold as pure ground coffee is immense. But the adulteration in this case is less harmful than coffee itself of the best and purest quality.

OUR "Everywhere" correspondents will kindly bear with us that, owing to our Special Numbers, their communications have not received the usual prompt attention which we are always glad to give them.

For the same reason we have also been obliged to neglect the "Querist" Department, as also for the additional reason that we are receiving a greater number of questions than it is possible to answer without enlarging the space which we have devoted to them, thus trenching upon other Departments which may be deemed of equal value by our readers.

THE AMERICAN MAGNUM BONUM POTATO was sent to us by the originator last Spring for trial. It was tested at the Rural Grounds—not at the Rural Farm, as it should have been—and no record was kept either of the quantity of seed planted or of the yield. But this we may say: The yield was large and the quality of the potato excellent. We learn that this has been tested in many parts of the country, and that the reports are generally very favorable. It is rather unfortunate, in view of its becoming a standard variety, that there is an English Magnum Bonum, which, besides being much thought of in England, is likewise favorably reported upon here. Both kinds are now offered by American seedsmen.

MANY writers upon horticultural topics recommend smearing the trunks of trees with meat or blood, the use of tarred paper, tying laths, &c., about them as a protection against the depredations of rabbits.

Our attention was called a week or so ago to the fact that rabbits were gnawing and biting off the smaller branches of our low-growing young fruit trees. The main-stem was in no case harmed. These stems had previously been washed with a mixture of lime, whale-oil soap, &c. Attributing their escape from rabbit attacks to this wash, we at once washed all of the branches within reach of the rabbits with the same wash. So far as we can ascertain the rabbit depredations have ceased.

FROM his reply to a letter of ours, written to Dr. J. B. Lawes, of England, respecting the extent to which our corn was influenced by the fertilizer used, we take the liberty of printing the following:

"I am disposed to hold the same opinion as yourself that the bone has little to do with the immense yields. At the same time the food must come from somewhere. All our experiments are tending more and more to draw the line between the food which plants obtain from the atmosphere and that which they obtain from the soil. When once this is done; when we cease looking up to the air for the fertility which is all the while lying under our feet, we shall then see plainly very much which is at present obscure. England is experiencing the most severe Winter which has occurred since 1838–9. I think there is sufficient snow to protect the wheat."

SHORT-HORN CATTLE SALES AT AUCTION IN ENGLAND FOR THE YEAR 1880.—We find a report of this in the London Live Stock Almanac, by Mr. Thornton. The total sales were 46; the number of animals sold 1,738. The highest price obtained was 2,000 guineas ($10,000); the lowest price two and a half guineas ($12.50); the average price of each £35, 4s. 6d. (about $170); the total amount £61,220, 4s. 6d. (about 294,000). We do not know how this compares with the American auction sales for 1880, but presume Mr. Allen will give them to us in his forthcoming volume (the 20th) of the Short-horn Herd Book, which will be published in a few weeks. But there is this difference between English and American sales to be considered, in estimating the whole number of Short-horns sold on each side of the Atlantic the past year, those in England being chiefly at auction, while those in America were largely made privately, of which no record is made or can be obtained.

THE FOOT AND MOUTH DISEASE.

THIS has again become very virulent in England, and is doing great injury to the herds there. Up to the middle of January it had already appeared in 29 counties, and was rapidly spreading over the kingdom. The effect of this will be very disastrous to horned stock, and lessen the production of calves materially for the two coming years at least. This is a deplorable calamity to English farmers, following the disastrous weather and short, bad harvest of the years 1867, '8 and '9. The effect will be to make a greater demand for American dead meat and cattle, which we shall do well to strive to meet with an improved quality of beef. At the same time we have to look out sharp to see that the disease does not spread in our herds at home. It is to be hoped that Congress will not adjourn till a general effective law is passed to meet this danger. It may save us ultimately from great disaster and terribly heavy losses. Without such a law no man's cattle are safe in America, for single State laws cannot prevent the spread of the disease.

OUR GREAT CROP.

THE Iowa State Agricultural Society has recently published some curious facts with regard to the productions of that great Western State. Among the figures those relating to corn are the most curious. The product of corn last year was over 230,000,000 bushels, grown on nearly 5,750,000 of acres, yielding an average of 40 bushels per acre. The value of the crop was more than 50 per cent. greater than that of wheat. But estimating the quantity consumed in the State at the very liberal amount of 40 bushels per head for horses, mules and horned beasts, cows included; 10 bushels for every hog; half a bushel for each person, and 5,000,000 bushels for manufactures (whiskey chiefly), there is left more than 100,000,000 of bushels for disposal in other directions. As the whole of the foreign export was only 100,000,000 bushels last year, clearly all the surplus from Iowa could not have gone abroad. Where then did it go? How much was purchased in the Southern, Middle and Eastern States and used by farmers there? Probably the disappearance may be explained in that way. There is an ample outlet in foreign countries for all the Western corn that can be grown. Our exports are growing enormously and the more the Europeans get of our corn the more they want of it. In 1879 the exports were 77,000,000 bushels; in 1880, there were more than 100,000,000. What they will be in five or ten years who can guess?

THE COTTON INDUSTRY.

THE late census report exhibits some interesting figures concerning cotton manufacture in this country. The greatest increase in the number of looms is in the New England States, where in 1870 there were 114,982, and in 1880 185,743, an increase of 70,761, and the number of spindles now in operation being 8,806,317 against 6,498,308 ten years ago.

The increase in the consumption of cotton in the different portions of the Union is noticeable.

In New England the increase in ten years is 83 per cent.; in the Southern 146 per cent.; in the Middle States 18 per cent. and in the Western 150 per cent., and the whole number of pounds of cotton consumed by the manufacturies as shown by the last report is 304,893,650 greater than in 1870.

The Middle States, it appears, are falling far behind the others in cotton manufacture. Pennsylvania actually consumes less cotton than in 1860, while the South, although laboring under a protective tariff on machinery of 37½ per cent., now manufactures more than all the Middle and Western States together. The business which the South is destined to do in the line of raising and manufacturing cotton will be unrivaled. An enormous amount of capital can be saved by manufacturers there as soon as they possess the advantages which New England has in improved machinery, and as long as their management is economical and skillful.

The saving in labor, freights, commissions and cost of material will enable them to compete with the sisters States, and could the oppressive duties on cotton machinery be removed, mills in the South would be greatly increased in number and efficiency.

FOOD ADULTERATION.

THE adulteration of food, condiments and beverages, has become an immense business from which some very respectable people derive very respectable profits. But all this is so artfully done that in many articles of diet it is quite impossible for the majority of people to detect the "cheat," and we are inclined to praise the skill displayed in this work at the same time that we denounce this policy of deception.

Many people would not seriously object to eating oleomargarine, knowing it to be such, but they do object to eating it for butter. When sold as oleomargarine it is well enough, for when properly manufactured it is much more wholesome and nutritious than poor butter.

Pulverized sugar has many properties that would not make it "half so sweet" if we knew what they were. The presence of certain acids is necessary in order to correct the dull, yellow color of the cane sugar, and glucose is now largely used in sugar manufacture, so largely, indeed, in one instance that it is said a single firm in one year realized as profits $1,000,000 on a capital of $400 000. Glucose sirup mixed with low grade molasses makes an excellent golden sirup, which sells well in market, or when allowed to harden it can be ground up and mixed with low-grade dark-brown sugar, and a substance results having the appearance of a refined, light-brown sugar, though not quite as sweet.

Is it necessary to speak of milk adulteration? What did the analysis of 45 cans of milk in New York show? Simply that the quantity of water extenuation was about one quart to three and that in this way water was bringing the comfortable price of eight or ten cents per quart. Not much, indeed, if one were dying of thirst on the Great Desert, but rather high here. And so we might go on through the list, finding in confectionery almost every metallic poison known to science; in coffee, various quantities of chiccory and other substances; in certain teas, 35 per cent. of poisonous substances; in pickles, blue vitriol and alum; in pepper, mustard husks, etc., to the extent, in an extreme case, of 98 pounds to two pounds of pure pepper, and in vinegar corrosive sublimate was found. It is gratifying to know that, in some sections of the country, not only individuals but corporations are becoming thoroughly awakened to this kind of fraud and imposition, and are waging an unrelenting warfare against it, and we trust that at no distant day such preventive means will be used as that no article shall be sold, in quantities large or small, under any other name than its proper one.

BREVITIES.

THE present Winter will prove a severe test as to the hardiness of the Japan Maples. Ours are not harmed as yet.

ALL accounts, thus far, from those who have constructed silos and are feeding the ensilage, are favorable to the system.

WE see that a sovereign for three or four miles was not an uncommon charge by the cabmen of London during the late snow obstructions.

OWING to a press of matter in this week's issue of the RURAL, the reports of the Mangels have been crowded out. They will be presented next week.

THOSE of our small fruit growers who have had any *experience* with the Bidwell Strawberry would oblige us by communicating the results of such experience.

MR. W. A. WESTCOTT, of Vienna, is the only one who has correctly read the Rebus in the Corn number of the RURAL. "Thistle bee acorn a dish on"—This will be a corn edition.

All subscriptions received after this date, will be placed on our lists to receive the Rural New-Yorker one year, counting from the date when the subscription is received. We have no back numbers.

GENERALLY speaking, we have a liking—not to say a respect—for "old-fashioned" things. But the present Winter has been quite too old-fashioned to suit us. It has gone to an extreme—and "extremes meet."

A PETITION has been signed by many praying the Legislature of Massachusetts to investigate the whole question of ensilage—what crops are best for the purpose and at what stage to cut them. Our agricultural colleges, especially that at Lansing, Mich., should test the question.

THE New York Sun in its agricultural columns expresses the opinion that the best thing to be done is to abolish the Department of Agriculture at once, for the reason that good and efficient men have never been selected as Commissioners. Working upon this plan throughout, what should we do for a Government?

LOST NATION and White Russian Spring wheats seem to have done well in Western Canada. Some of our *Winter* Lost Nation was, as an experiment, planted (by hand) about a foot apart each way upon a finely-prepared seed-bed. If there is any weakness about this variety, the present trying Winter will be very likely to reveal it.

CHICCORY does best in land suitable for, and treated the same as, carrots. It is best to sow in drills about two feet apart on well-prepared land. It is just as important as with onions that the land should be kept rid of weeds until the chiccory is well started. Afterwards it is as well able as any plant we know of to "take care of itself." In the drill the plants should be thinned to about a foot apart. The roots should be washed and dried; then roasted and ground. It is said that chiccory is a valuable plant as forage for sheep. We should like to hear from some of our sheep husbandry writers on the subject, as we have had no experience ourselves.

PREMATURE CALVES.—The late Earl Spencer, registered the result of pregnancy of 764 cows, and found that no live calf was born under the 220th day from the service of the bull; and that he had never been able to rear one born under the 242nd. day. A writer in the English Agricultural Gazette, adds to this, that he has a calf dropped the 240th day after service, and it is as fat and lively a calf of its age as one commonly sees, being three months and seven days old at the time of his writing. This birth was two days less than the record of Earl Spencer. It was the produce of a Herd Book Short-horn cow, which tells something in favor of this fine, high bred race of cattle.

A REPORT on the varieties of cane best adapted for sirup and sugar, made to the Mississippi Valley Cane Growers' Association, states that Early Amber is the earliest of all, and is valuable for its light-colored sirup which is rich in sugar. But there are objections to it south of the 40th parallel. Early Hybrid ripens five to ten days later. It has a large cane and is well adapted to poor soils, but it is liable to lodge on rich soils. The Kansas Orange is superior to the Amber as to yield and quality of sirup—200 gallons being a fair yield. This ripens about ten days later than the Amber. The Early Orange is at least 15 days later than the Amber and yields 50 per cent. more. Its sugar is superior. This and Kansas Orange are recommended in the report for the main crops in the latitude of 40 and south and for trial north.

OSTRICH farming is taking the place of sheep husbandry in some parts of Cape Colony. Advices of a late date from Port Elizabeth tell us that thereabouts farm after farm is being cleared of sheep to make room for ostriches which had become "all the rage" as no other industry is so profitable. Recently several joint-stock companies had been started for working the farms on a large scale. The exports of feathers from the above little port during the first nine months of last year amounted to over half a million pounds sterling, or about $2,500,000. The demand was fully up to the increased supply, and while prices were excellent for ordinary feathers, there was the keenest competition for choice specimens. The method of ostrich farming at the Cape of Good Hope was fully described in a profusely illustrated article in the RURAL, for April 27, 1878. We have not heard that any one has embarked in the business in this country, though it might be found profitable in some sections.

For Women.

CONDUCTED BY MISS RAY CLARK.

"THE NAME OF MOTHER."

THERE are words that speak of a quenchless love
Which burns in the hearts we cherish,
And accents that tell of a friendship that proved,
And will never blight or perish.
There are soft words murmured by dear, dear lips,
Far richer than any other:
But the sweetest word that the ear hath heard,
Is the blessed name of Mother.

Oh, magical word! may it never die
From the lips that love to speak it,
Nor melt away from the trusting hearts
That ever would break to keep it.
Was there ever a name that lived like this?
Will there ever be such another?
The angels have reared in Heaven a shrine
For the holy name of Mother.

TO THE SWEETBRIER.

OUR sweet, autumnal, western-scented wind
Robs of its odor none so sweet a flower
(In all the blooming waste it left behind)
As that the sweetbrier yields. And the shower
Wets not a rose that buds in beauty's bower
One half so lovely; yet it grows along
The poor girl's pathway—by the poor man's door.
Such are the simple folks it dwells among,
And humble as the bud, thus humble be the song.

I love it, for it takes its untouched stand
Not in the vase that sculptors decorate—
Its sweetness all is of my native land;
And e'en its fragrant leaf has not its mate
Among the perfume which the rich and great
Buy from the odors of the spicy east.
You love *your* flowers and plants, and will you hate
This little four-leaved rose that I love best.
That freshest will awake, and sweetest go to rest?

DESCRIPTION OF CUTS.

FIG. 101.—CHILD'S BONNET.

The bonnet is of blue plush, trimmed with satin ribbon. Cap of cream-colored lace.

FIG. 102.—HOOD.

This hood is of pekin. It is lined with satin, and is ornamented with cord and tassel.

FIG. 103.—PELERINE.

THE pelerine is of pale blue plush, trimmed with cream-colored pleated Bretonne lace.

FIG. 104.—KNITTED SOLE WITH TOE.

Materials required: 3 oz. white lambs-wool and four knitting-pins.

This sole is intended to be worn inside the slippers during cold weather. Commence at the heel. For an ordinary ladies' size, cast on 15 stitches, knit backwards and forwards for 20 rows, increasing one at the beginning of every row; from the 21st to 40th row decrease by knitting two together at the beginning of every other row; from the 41st to the 50th row knit without increase or decrease.

51st to 61st rows: Increase at the beginning of every row; now take two other pins and cast on 20 stitches on each; knit two and purl two on the 40 stitches, knit the sole stitches plain; continue thus for ten rounds, then knit all round for five rounds. Now commence the decrease for the toe by knitting two together in every third round, at the beginning of the first front pin, at the end of the second, and at the beginning and end of the sole pin; continue to decrease until only ten stitches are left; slip the stitches from one of the front pins on to the other, place the pins two together, and cast off both rows of stitches together.

FIG. 105.—FIRE-SCREEN.

The frame of the screen should be made the size to suit the room. The balls on which the screen stands, and the ornaments at the top, are gilt. The screen is of quilted satin, to match the drapery of the room for which it is intended, with a stripe of poonah painting, on white velvet, in the center of each fold. Embroidery may be substituted, if preferred, for the poonah painting.

FIG. 106.—HOME-DRESS.

The dress is shown in different materials. Fig. 1, showing the back, is of two shades of brown checked material, with woven border which forms the trimmings; it is laced at the back. Fig. 2, is of dark-green plaid; fichu of coffee-colored lace.

ALLINE AND I AGREE.

WE are all glad to know that Alline Ray's husband is "one of the exceptions who does not need to be pulled over the coals." We hope he is not in the situation of that good man who said he had been married twenty years and never given his wife a cross word yet. The neighbors said, "he didn't dare to."

However the case may be, we all feel sure Alline dares to speak up for herself if oppressed. Not being a farmer's wife, and having nearly always had help in the kitchen for twenty years I cannot be accused of "speaking in meeting," on my own account—when I do reiterate what Alline says about the sin and shame of farmers wives working on as they do single-handed, under burdens that might crush an elephant.

I am convinced that the fault is in the beginning. Young husbands are very pliable and can be made to see that help is really one of the necessities of the household, the same as flour and one that must be provided for. Let a wife drudge on a few years without this help and he will begin to think that she always can.

The fault too often is with the ambitious young wife; she wants to please Mrs. Grundy, she wants to be thought just as smart as her next neighbor and she will show that she is, whatever the sacrifice. Where there is a smart woman in the case do not lay all the blame on the poor husband. Many wives will not have help, except in a case of life and death. They will not "put up" with their shiftless ways. It is a trial to any of us, but it is always wise to choose the better of two evils. Be sure you start right. OLIVE.

MARRY A GENTLEMAN.

"MARRY a gentleman, girls, if you can," was the heading of a little poem which appeared in the RURAL some weeks ago. I do not remember anything else about it, but I want to add emphatically if you cannot, do not marry at all.

A gentleman, that is not merely a man above the need of work; there are scores of those who

FIG. 105.

are anything but gentlemen; but a man who knows how to work, who has self-respect enough to keep him from low habits both of speech and action; who is courteous and honorable; who is not afraid of soiling his hands; the farmer, the blacksmith, the carpenter, any man may be a gentleman under dust and soot and chips, but if he is not, girls, don't marry him at all!

There is enough trouble in life without increasing it in any way. Do not subject yourself to the mortification that would be sure to come with a husband who would continually cause you to blush for his lawless actions, for his coarseness and roughness, for his slippery dealings or for his hypocritical polish. And you, whose youthful heads are full of romantic ideas, do not let your susceptible hearts be taken by flashy clothes and an "air," by a show of wealth or by flowery compliments. The true man does not indulge much in that kind of thing. Wealth is a good thing, but it is not all; poverty is bad, but it is not the worst trial we can have.

There is many a woman who apparently deliberates more over a new hat, or the cut of a dress, than she does over the character of the man who asks her to marry him. Do not rush into it without due consideration. Make yourself worthy of a gentleman, and if you cannot marry one, do not marry at all. R. B.

CORRESPONDENTS' CORNER.

IN reading Mary Wager Fisher's communication in RURAL of Jan. 8th, concerning the use of scraps of silk and velvet, I was much interested, as it seemed easy and sensible. After collecting and smoothing out my stock, I was puzzled to know how to begin, and, seeing you answer inquiries, I have written to ask if she would illustrate a black one of the many she has made, and truly oblige

N. Y. A. NEW SUBSCRIBER.

In Mrs. W. V. A.'s letter mention is made of cat stitch. I would like an illustration of the stitch if convenient. By so doing you will oblige a constant reader and admirer of the "Old RURAL."

N. Y. MRS. R. S.

Will Mrs. W. V. A. accommodate? R. C.

DISCOURAGED.

YES, I really feel discouraged, after reading "Female Farming Extraordinary," and it is enough to make any ordinary woman feel so.

I have been over all those sixty-five acres of corn, those acres of millet, wheat, etc., and tried in vain to satisfy my mind that it could be legitimately done, I have thought about that house, and wondered how many beds there were to be made up each morning and if the *extra*-ordinary female did them all. Wondered if she got the breakfast and washed the dishes. Wondered what she cooked for dinner, and how much washing and ironing she had each week. Wondered if she did all the sewing and if she copied her serials herself. Wondered—well I wondered until my head ached and I said—"pshaw! I can't believe it.

Now, "W. F. Jr." do let us hear from you immediately; tell us that you wrote that article for a joke, or that you are a relative of Eli Perkins or Mark Twain, and we'll forgive you and let it pass—for what it appears to be.

I wish you had stated more explicitly what the "dirty work on the farm" consisted of, what the little girl did, and how old she is.

I can imagine "Edgerton" exclaiming, with tragic gesture as he viewed those luxuriant fields and saw the flutter of his wife's skirts as she followed the plow or harrow, "Othello's occupation gone!"

No wonder she is a fragile looking creature after doing all that work it would not be surprising if she were "gaunt and bony."

ALLINE RAY.

1. FIG. 106. 2.

Literary Miscellany.

THE OLD YEAR AND THE NEW.

THE year whose hours have lately closed
Both cheer and gloom have brought,
Yet we are privileged to view,
With hope the future fraught.

Sickness and sufferings, painful hours,
Our cherished ones have tried,
Yet has a sympathetic friend
Been ever at our side.

Thus though affliction's bitter pangs
Our anguished hearts may wring,
Of God's great mercies in the past
We gratefully may sing.

And as the bright New Year begins
We would devoutly pray
That God would grant us needed strength
Sufficient for each day.

We may not pierce within the veil
Thy future will to see,
But we can safely trust our lives,
Our all, O, God, with Thee.

Though parted, lonely and perplexed,
Without a fixed abode;
Unite us daily as we bend
Before Thy throne, O God.

So bless, and so support our souls
Midst coming joy and woes,
That we may through the year be Thine
Until its moments close.

If joy or sorrow, life or death,
By God's decree be given,
On Christ our Rock be all our trust
The Lord of Earth and Heaven.

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

(Concluded from page 91.)

I looked fiercely at the fellow, throwing all the fire of my diminished soul into my eyes, for I thought him the most coolly and genteelly impudent hotel clerk that I had ever met. He returned my gaze with a look of such unperturbed and benignant dignity, mingled with so much surprise, that my heart quailed before his commanding impudence, and there was nothing left for me to do but to swallow my indignation and walk away like an injured man. As I did so my eye caught what I took to be a vender of cigars in a distant corner stowing away his wares for the night. I had always found something soothing in a smoke before retiring, so I stepped up to the man and asked him for a cigar.

"Cigar!" he repeated, "I haven't it, sir. Who is the editor of it or where is it published?"

As I saw nothing but papers and magazines on the counter, it struck me that I had made the mistake of confounding a dealer in news with a dealer in cigars, and that the fellow was disposed to make a joke out of my mistake at my expense. I felt indignant, but knowing at what a great disadvantage a man in anger is always placed, I resolved to preserve a calm exterior. "And you have no tobacco either, I suppose," said I, looking fiercely at him.

"Pardon me, sir," said he, "but I deal exclusively in papers and magazines."

"As you have a perfect right to do, if you choose, I suppose," said I, "but in my country it is not considered at all disgraceful to sell smoking utensils by the side of papers and magazines; and peculiarly, very advantageous."

"May I ask, sir," said he, "what you mean by smoking utensils?"

Why, pipes, tobacco, and cigars," I replied.

"Do you never make use of these articles for smoking in this country?"

"I have never heard of them being used for that purpose," he replied. "Or, yes; come to think, I believe florists and agriculturists sometimes make use of a substance called tobacco to smoke the lice off of plants."

I did not know what to make of the fellow; he seemed so thoroughly honest in all he said, and was so courteous and gentlemanly in his manner that I could scarcely believe that he was as deliberately insulting in intention as his words seemed to imply. After thinking the matter over, and reflecting that I had not seen a single smoker among the people whom I had observed, I came to the conclusion that tobacco using as a personal habit was unknown in this country. But that a person connected with a fashionable hotel should confound "cigar" with a paper or magazine struck me as being exceedingly funny.

Without being permitted to enjoy the solace of a cigar or a glass of brandy, I retired to my room. This was a good-sized apartment, tasteful and neat in its appointments, and furnished with every convenience that could be desired. I sat down by the window which overlooked a principal street. The light, which was blazing with all its power when I entered the hotel was now reduced to a mere glimmer, sufficient to light an traveler on his way whom necessity might compe

to be abroad. There was no rumbling of cars; no tramp of feet, no rattling of carriages, and clatter of horses hoofs upon the pavement; but everything betokened that quiet repose to which it was the custom of the city to devote the hours of night.

There was little to interest me at the window, so I soon turned from it and went to bed. It was a long time, however, before my mind ceased to revolve the events of the evening, and I composed myself to sleep.

CHAPTER II.

BREAKFAST HABITS OF THE PEOPLE.

I awoke in the morning quite refreshed, and quickly making my toilet, I sought the breakfast-room, for my long fast had made my appetite ravenous. The large hall was already filled with guests—noble-looking men and women—who gazed at me as I passed down the long hall with much the same curiosity that I suppose we would look upon a harmless and respectable inhabitant of the islands of the Caribbean sea. I affected to be indifferent to their observation, however, and took the seat proffered me by a waiter with an air of much importance.

"Coffee, porter-house steak and a hot roll," said I, sententiously, taking no notice of the bill of fare which the waiter placed before me. He looked at me and shook his head dubiously. Evidently he thought I was speaking in a foreign language, for, without saying a word, and looking at me significantly, he pointed to the bill of fare. I looked it over. It was meagre and plain enough to suit the most abstemious habit. So far as I could understand the dishes, they were composed chiefly of grains and vegetables. Mush seemed to be the favorite dish with the guests, for as I looked over the hall nine-tenths of the breakfasters were engaged with bowls and spoons.

I called for a dish of *oatrena*, at a venture, and was about to supplement my order with several other dishes in order to give variety to my repast, but when I looked up the waiter was gone. A minute afterward he returned, bearing a bowl of milk and a dish which proved to be oat-meal. For oat-meal it was certainly very palatable, but my taste was not simple enough to relish it in the same degree that I saw those around me doing. I craved my cup of coffee and my hot roll.

FIG. 101.

"Can you not give me a cup of coffee?" I asked of the waiter.

"Coffee!" he repeated. "No, sir; I have never heard of that dish."

"Never heard of coffee!" I exclaimed, "and a waiter in such a grand hotel as this."

"I must confess that the dish is quite unknown to me," he replied, "and I doubt if you would be able to find it in the city. Perhaps, however, it may be a dish well known among us, but called by another name in your country, for I judge you to be a foreigner."

The fact is," I said, "it is not a *dish* at all, but a drink."

"A drink!" he exclaimed. "Then it certainly cannot be known among us; for we never drink anything in this country but water and milk."

"You don't say so!" I exclaimed. "Milk and water, eh! Really now, my good fellow," I continued, in a sly and confiding manner, "you don't mean to say that you never take a nip now and then when you are out of an evening, skylarking with your friends"

"Excuse me, sir," said he, with an air of dignity which would have become a statesman. "You use terms which are quite incomprehensible to me. But so far as I am able to judge from your manner, the idea which you intend to convey is not at all complementary to my personal worthiness."

I looked at the fellow in surprise. His appearance was all that this language seemed to imply. Indeed, he had so much the look and manner of a true born gentleman, that I felt constrained to ask his pardon for being so familiar.

"Is it not the custom of this country to eat meat at breakfast?" I asked, glad to change the subject into another channel.

"Meat!" he repeated with a puzzled look, as though he did not comprehend the meaning of the word

"Yes, meat," I replied, "the flesh of animals."

He looked at me with a horrified expression, as though I were a cannibal with my knife drawn to whip off a tidbit from his plump, finely developed person.

"It is not the custom of our country to eat the flesh of animals at all," said he.

"Well! well!" I exclaimed. "Vegetarians, and yet a race of vigorous, muscular, and finely developed people! Surely you must have some substitute for meat beside the fruits of the earth. Why in my country meat is considered the very juice of life among articles of food."

At this juncture the waiter went off to serve a newly arrived guest, and my query was left to be answered by my own observation. The substantial part of the meal seemed to be now pretty generally finished, and the waiters were distributing among the guests dishes of various kinds of fruit, the largest and most luscious in appearance that I had ever seen. Though I had arrived late in the breakfast hall, I was ready for the dessert as soon as any, for I was always a rapid eater, while the other guests seemed to devote themselves to the meal with a deliberation, which, for the morning repast, seemed to indicate that business was not at all pressing. They talked and joked and laughed much after the manner of invited guests at an evening repast, after the cares and labors of the day have been concluded. But my surprise at the

FIG. 102.

want of impatience to get off to business which characterized the guests was increased when, the last course of the meal being scarcely finished, the room was suddenly filled with the most delightful music, which held the people to their seats for a full half hour after the meal had been concluded. I looked about me in every direction for the source of the music, but it was so etherial that it seemed to pervade equally every portion of the room. To me, at least, its influence was delightfully soothing. Every mental faculty seemed lulled to repose, and, scarcely conscious of the existence of bodily organs, every necessary function was performed without a disturbing influence.

As soon as the music ceased the guests left the hall with one consent and departed to their various avocations. There was no lounging about the office of the hotel, smoking and gossiping, but each one seemed to have business to do and went directly about it.

CHAPTER III.

WHAT I LEARNED OF THE PEOPLE FROM THEIR NEWSPAPERS.

I stepped up to my friend, the news-dealer, and asked him for a morning paper.

"Which will you have," he inquired, "the Chronicle, the Messenger or the Intelligencer?"

"What are their politics?" I asked in return; for it had always been the pride of our family that we never read any but Republican papers.

"Politics!" he exclaimed, with a look of surprise. "They have no politics; that is, if I have a correct apprehension of the term. You refer, I suppose, to their opinions upon questions of government."

"Exactly. And do you mean me to understand that there is no diversity of opinion upon questions of this character among your newspaper men?"

"None whatever. Our government is very simple, and founded upon axioms to which all the people give a unanimous assent."

"Indeed," said I. "Happy, then, must be your condition as a people. But pray, sir, what do your newspaper men find with which to fill up their columns?"

"They deal mainly with questions of science. In recording discoveries, sifting opinions and discussing hypotheses they find abundance of entertaining information to impart to their readers."

"And do the people in general take an interest in these scientific discussions?"

"Certainly. They have their preferences, of course. Some are particularly interested in what is transpiring in the worlds about us. These take the Chronicle; for, aside from the general news of the country, this is peculiarly the organ of the Astronomers Others take a special interest in the pre-adamite world and its inhabitants. These read the Messenger, as it is devoted to the discussion of questions relating to the early period of the earth's existence. So every leading paper is the special organ of some branch of science, at the same time that it is the chronicler of the general news of the country."

A dozen questions at once arose in my mind relating to this peculiarity of newspaper enterprise, but, having some pride in not wishing to show my utter ignorance of such common matters, I bought the three leading papers and sat down to give them an examination.

I first took up the Chronicle. Its leading article on the first page was an account of recent discoveries in the planet Jupiter. It seemed that a certain ingenious and astute astronomer had lately perfected an improvement in astronomical instruments by which the heavenly bodies were brought some millions of miles nearer the earth than they had ever been before. Thus the planet Jupiter, which had been enlarged from a twinkling star to a great disk, with valleys and mountains clearly discernible, was now brought so much nearer to the earth that moving objects could be discovered in the dark ground between the shining belts of the planet.

Owing to the rapid revolution of the planet, and the obscurity doubtless arising from the shadow of its rings, or the mists of its atmosphere, it was a difficult matter to get a view of these moving objects sufficiently clear and continued to obtain a reliable idea of their forms and natures. Occasionally they would come out in strong relief, probably when a direct aspect was favored by a clear atmosphere, and a favorable conjunction of light from the planet's satellites. Then a rapid observation brought out their outline with sufficient distinctness to make certain that they were largely made up of hideous-looking monsters of the saurian order, something like those which inhabited the earth in one of its geological periods. They seemed to swarm in countless numbers, especially on the borders of what looked like glistening plains, which was probably the water or other fluid peculiar to the planet.

There were beside these, immense creatures which moved upon the land, and which seemed to appear and disappear among what was undoubtedly the foliage of the planet; and others were more hideous and uncouth still, which seemed to move with much rapidity over the face of both land and water. From this fact, and the striking peculiarity which they presented of alternately diminishing and increasing in size as they moved across the face of the planet, as well as the fact that they sometimes appeared as a moving mass behind which, as it moved along, every other object on the planet disappeared, it seemed reasonable to conjecture that they must be winged monsters, analogous to the Pterosauvians of our own primitive world.

In other respects the appearance of things on the planet seemed to indicate that it was in a very early period of its existence. There were great ranges of mountains, dark with forests, and great rivers flowing in the valleys, while now and then, as the planet revolved on its axis, a volcano, belching forth fire and smoke was brought into view. What appeared of the planet outside its rings was of a glistening brightness, variegated with darker shadings, which told of glaciers and great fields of snow and ice. But nothing which came within range of the teleseope spoke of an inhabitant possessed of reason and intelligence.

Such in brief was the gist of the article. I had to read it over several times to get a clear impression of it, it was so incumbered with scientific terms which I did not understand, and contained so many allusions to matters of which I was wholly ignorant.

The inhabitants of Mars and the condition of things generally on that planet were spoken of in such familiar language that it certainly appeared to me that some sort or telegraphic communication must have been established between the astronomers of these two neighbors in the planetary system; while from many allusions to Mercury and Venus, I inferred that the physical peculiarities of these planets were almost as well known as those of the earth itself.

Turning from the Chronicle to the Messenger, I found its leading article to be a long-winded and to me quite unintelligible dissertation on the remains of extinct animals of prehistoric time. I marveled that such articles should be found of as much interest to the general public as their place in a great daily paper seemed to imply. But I was continually forgetting that I had fallen among a very superior people; whose vigorous minds were capable of digesting such mental pabulum with the same facility and gusto that the general public of my own country devoured the political tirades, party glorifications, and public and domestic scandals with which they were daily regaled.

I next took up the Intelligencer to learn something of its peculiarities. But it was devoted to a science of which I had never even heard. It seemed to have some relation to the solar and lunar rays of light in connection with malarial emanations from the surface of the earth, but it was as profoundly dark and deep to my mental vision as a dessertation in protoplasm would be to a Goshoot Indian. I therefore turned for relief to the general news of the day. And, marvelous to relate, in each of the three great dailies, which were much greater in size, though printed in much larger type than the leading papers of my own land, the news of the country which was not distinctively scientific was included in a single page. And it was tame and uninteresting enough to accord completely with the other matter of the paper. The blood curdling murders, and brutals assults to which whole columns were devoted in the periodical of my country; the drunken lawlessness, the suicides, the robberies, the defalcations, the fires and other catastrophies on land and sea, by which human life is destroyed and

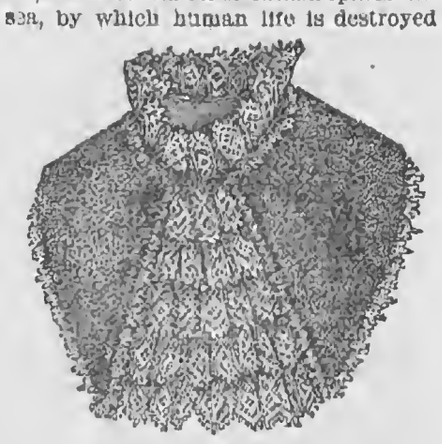

FIG. 103.

happy homes made desolate, the domestic scandals which the news mongers roll as sweet morsels under their tongues, the party jealousies and animosities; the scurrilous attacks upon men of an opposite political faith, in fine all those items of news gathered from near and far, with much assiduity and at great expense, which makes the newspapers of my own country in so large a degree a record of crime, human misery, human weakness and the activity of the debasing passions of our nature, all these were entirely excluded from the news columns of the papers before me.

Is it possible, thought I, that there can be none of these events to record, or are they excluded because popular sentiment disapproves of their publication. I inclined to the latter opinion, for great as was my regard for the virtue and intelligence of this people, I could not believe that they were raised so completely above the common accidents of life, and the common frailties of our nature, as the exclusion of such matters from their daily papers seemed to imply.

What, then, was the character of the general news of the country? It was made up of such dry information as marine intelligence, mercantile intelligence, agricultural intelligence, aerial intelligence; for it seemed that in this country travel by air-ships was as common as that by boats and railroads in my own. Death and marriage notices of eminent persons, discoveries and inventions of things generally useful, social items of popular interest, and matters relating to the municipal and state governments.

I could not but express surprise at the character and meagreness of this last class of news to which so much importance is given in the papers of my own land, and which too often pays but a poor compliment to the charitableness, purity and integrity of human nature.

Here is a sample or two from the Chronicle: "Mr. Jasper J. Praiseworthy, who has filled so acceptably the position of treasurer to the city of Hopewell for fifty-seven years has resigned on account of the increasing infirmities of age, and has appointed his son, who has been associated with him in the performance of his official duties for the past eight years, his successor."

"We learn from the semi-annual report of Governor Boyle that a surplus of $10,000 remains in the treasury after all claims against the government have been satisfied; and that he purposes devoting half of this amount to the relief of the sufferers by the recent hurricane in the province of Ventrolin. The remainder will be divided among those persons who sustained damage from the freshet on Hello Creek during last Spring, *pro rata*, to the amounts which they have severally reported."

"In accordance with the recommendation of the people of Menlith township, Governor Wendell has made such a modification of the regulations respecting the aerial postal service as the peculiar topography of that township seems to render necessary.

My mental comments on these items of government news may be easily imagined. They certainly corroborated the statement of the newsdealer that the government was very simple, and founded upon axioms to which the people give a unanimous assent. Such wonderful powers as seemed to be granted to the rulers, certainly appeared to me to betoken great unanimity among the people.—[To be continued.

A REMINISCENCE OF BOOTH, THE ACTOR.

One day, while Booth, the father of the present world-renowned actor, was rusticating in the country, enjoying much-needed rest, he was accosted by a friend, and after the usual salutations were passed, conversation naturally turned to acting, recitation and kindred subjects. The friend remarked, "Now, Mr. Booth, I would like to ask if you have ever heard the Lord's Prayer read or repeated with anything like the earnestness and heart-felt devotion which ought always to characterize the rendering of it?" "No," replied Booth, "I have not. No one seems to enter heart and soul into it as they ought." "Well, Booth," said his friend, "I should like to hear *you* try it some time. As one who has devoted much time and study to a proper rendering of both prose and poetry, you must have your ideas about this."

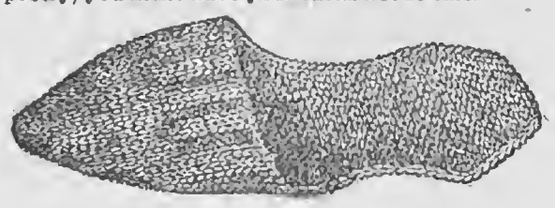

FIG. 104.

After a moment's consideration, Booth replied: "Now, sir, I do not know that I could do it with any greater effectiveness than a thousand others, but I have my ideas about it, as you say, so I'll tell you what I'll do. A while ago I overheard some of the church people of the village saying that they would like to raise some money for church purposes, so, to help them a little, if you will get their consent to open the church one week from to-night, I'll recite the Lord's prayer there. However, I must have the privilege of arranging the platform, desk, lights, etc., as I wish. Put the admission fee at a dollar; they won't lose much, if there's no gain." So, presently, the friend departed, talked the matter over with the village people, and advertised the reading of the Lord's Prayer by Booth, the actor.

The evening came, and the church was crowded to its utmost capacity. Booth's world-wide reputation assured him of a hearty welcome wherever he might go, and in whatever *role* he might appear. On the platform, in the center, stood the small pulpit-desk, and on it, a single flickering lamp cast a somber light over the scene. No other light was in the house, and a heavy twilight, approaching darkness, rested upon the audience. Precisely at the appointed time, a human figure, clad in the long, black vesture of a monk, came slowly and reverently upon the platform, from a side door, and moving toward the desk, knelt down before the open Bible, lying upon it, so that the lamp-light shone full upon the upturned face and eyes. The prayer began and all through from the "Our Father" to the last "Amen," no sound was heard save the solemn, awe-inspiring voice, repeating those precious words.

A solemn stillness prevailed! No one seemed to breathe, lest a single syllable should be unheard! Every eye was riveted upon that almost divine face, and every ear was strained to catch the faintest whisper.

The "Amen" came, the last faint sound was wafted to those who listened in almost painful suspense, the mournful figure glided back to the entrance door and was lost to sight. Not until the click of the latch was heard, as the door closed behind him, did the audience recover from this almost superhuman influence, then, as one present said, a great sigh rose from every breast, as if a weighty burden were removed, and the people

went home that night, feeling that there was a power in those wonderful words, they had never known before. Such was Booth's rendering of the prayer, and such its effect on the audience. That the surrounding circumstances added much to its effectiveness, there is no doubt, yet the soul of it all was Booth. J. W. D.

BRIC-A-BRAC.

THAT obelisk should have no fears,
It passed through all the ages dark.
No doubt another thousand years
Will find it safe at Central Park.—Puck.

HASH.

WHEN all the world is young, lad,
And all the trees are green,
And every goose a swan, lad,
And every lass a queen,
Then hey for boot and horse, lad,
And round the world away,
Young blood must have its course, lad,
And every dog his day.

JOSH BILLINGS WISDOM.

THE man who gets bit twice by the same dog is better adapted to that kind of business.

There is a great deal of religion in this world that is like a life preserver, only put on at the moment of imminent danger and then half the time put on hind side before.

Experience is a school where a man learns what a big fool he has been.

There are two kinds of fools in the world—those who can't change their opinions and those who won't.

A good doctor is a gentleman to whom we pay three dollars a visit for advising us to eat less and exercise more.

Out in the world men show us two sides of their characters; by the fireside only one.

The world is filling up with educated fools—mankind read too much and learn too little.

Every man has his follies and oftentimes they are the most interesting things he has got.

THE TURKEY.

PROUD bird of the barnyard, blithesome and free,
A murderous bludgeon is hovering o'er thee—
A fleet-footed urchin, a hard-hearted bub,
Will hit you a rap with more'n a stuffed club.

Make the most of thy time, for soon thou'l't be caught,
And thine own precious head to the block'll be brought.
Then gobble! and gobble! and gobble away,
Thyself will be gobbled at no distant day.

A rest to thy soul and peace to thy ashes,
A dinner thou'l't make and cheap sundry hashes;
A breakfast, perhaps, and a light supper, too,
And then be dissolved in a thin carcass stew.

EMMA ABBOTT tells a St. Louis reporter that the stage kiss is "a cold, dim, pale phantom, unsatisfactory, elusive, and empty." Miss Abbott ought to substitute a Hawkeye reporter for that tenor. If there is anything the staff of this paper can throw soul into it is a radiant kiss.—Hawkeye.

STUFFING A BOY.

"YES, I'm going to skate," he answered, as his teeth rattled together and his ears stood out like sheet-iron medals. "They tried to stuff me with a story of a boy who froze to death on the rink at the park, but I wouldn't take it,"

"Did one freeze to death?"

"Naw! Come to find out about it he just froze his ears and nose and fingers and toes, and the rest of his body wasn't touched at all! They can't scare me with any of their tales of horror:"—Detroit Free Press.

A LITTLE girl being asked what charity was, answered: "It is giving to the poor all the old stuff you do not want yourself." There was no mocking satire in her tones, and she did not realize that her words contained any bitter sting of truth. She was simply giving the necessary inference from her observations. It was the clothes that she had always seen given away—gifts that required no sacrifice.

Paralytic, nervous, tremulous old ladies are made perfectly quiet and sprightly by using Hop Bitters, daily.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING PIE; A "SCRAPPY" PAPER.

MARY WAGER-FISHER.

IT would undoubtedly be a useless attempt to undertake to convert the mass of the American people from pie-eating. Pie is one of the idols to which they are wedded, and the best that can be done under the circumstances, probably, is to endeavor to bring about a reform in the manufacture of the article. One of the chief objections to pie is that the under-crust is apt to be soggy and indigestible, either from being underbaked, or from being soaked with the "filling." This difficulty can be avoided by making the pie with but a top crust or with a bottom crust baked before the fruit is added. In "our house," with the exception of pumpkin, pies are always made in one of the above ways, and from the way in which they disappear among the pie-eaters, it is natural to suppose that they are well relished. To make a good pie of canned peaches, put a layer of the fruit in the bottom of a pie dish of stone-ware; put a half-inch strip of crust on the inside rim around the top, and a top crust, with two gashes in the middle, crossing each other at right angles. It is eaten as soon as cold. When you serve it, cut as usual, loosen the crust from the edge of the plate with a knife, then with a spoon lay the crust on the dessert plate, and add the fruit that belongs to it. Any sort of fruit pie made in this way, is incomparably better than when made with an under crust. Try it.

If you wish to make pie to last for a week or ten days, line the pie-dishes with crust and bake. When cold, slip all the crusts from the tins, and pile them on the top of each other, with an earthen plate at the bottom. When you want a pie, fill one of these crusts with stewed apple, and grate over the top a bit of nutmeg, place in the oven, until heated through. You will find it delicious, provided of course, both crust and stewed apples are good. These crusts can be filled with any sort of cooked fruit, and if the crusts are kept in a nice, cool place, they will keep fresh for several days; try this way, too. By this method "leavings" of preserves and jellies can be toothsomely utilized, as spread in the crust, they make of it a large "tart."

So much for pie, and now a word

Concerning Amusements.

A game which interests both old and young, which is entirely innocent and at the same time very instructive, is called the game of "words and sentences." It is simply a box of letters, each letter of the alphabet printed separately on a square of paste-board and each letter duplicated a number of times. Directions for playing the game come with the box. Adults like it as well as do younger people—it teaches them spelling, new words, and quickens the perceptions. Little children learn to read from it, by arranging the letters into words. All in all, it is a capital game, and I heartily recommend it for the social, or family circle. It costs but little, and is to be had, I judge, of most stationers and at book-stores.

Where children are not turned into a nursery with their playthings, it is well to limit their playground in the living-room of the house by giving them a certain part for their own. The boundary line may be a seam, or line, in the floor or carpet. By being firm, they very soon learn to keep on their own territory and to arrange their playthings and possessions in due order in their own special corner at night. If a child has a mania for cutting paper, the room can be kept free from the litter, by giving him a square of oil-cloth, or a rug to cut on.

Train the children to use a tooth brush from the earliest possible age, I began to use a brush on my little boy's teeth when he was twenty month old, and now at the age of three and a half years he brushes his own teeth. The use of the brush hardens the gums and it is altogether a mistake to neglect the first teeth. The health of the child, as well as of the adult, depends in a measure upon having the teeth clean and sweet, and it is always a sorry sight to see a child with decayed teeth. Some parents are so particular that they have the first teeth of their children plugged before becoming loose for the second teeth. A small, soft tooth-brush costs from fifteen to twenty cents, while a dentist's bill is often three times as many dollars.

Concerning the Hanging of Pictures.

The majority of people hang pictures too high on the wall. Whatever the hight of a room, the pictures in it should be hung on a level with the eye of an adult when standing, an adult of average hight. Pictures are hung upon the wall, supposably to be seen with both ease and pleasure; but when they are perched up nearly to the ceiling they can be viewed neither with the one feeling nor the other. When you have occasion to buy picture cord, buy, instead, wire, for hanging picture frames. Cord wears out, becomes moth-eaten, and some day down come your pictures with a crash. Hang your pictures so as to be nearly, if not quite flat against the wall. People who understand the art of hanging pictures *well*, no longer hang them so that the top leans out from the wall.

Tapestry rugs that have become worn out at the edge, may be tastefully renovated by binding them with wide woolen braid.

The Elder—Sambucus Canadensis.

Speaking of shrubs, there is nothing of more value than the common *elder*. The flowers are an excellent lotion for sunburn and roughness of the skin, and I remember when a child the pleasant taste of the elderberry wine that can be made with the ripened berries in the same manner as the expressed juice of any other fruit. It is considered a cooling laxative, and yet when taken hot, produces a copious perspiration. As a collyrium for the eyes the flowers as a wash are of great benefit. So while grown for beauty it can also be made of great use to the housewife.

ANNIE L. JACK.

DOMESTIC RECIPES.

Rice Fritters.

SOAK two-thirds of a cup of rice three hours in enough warm water to cover. Put as it is into a farina-kettle (or tin pail), set in an outer vessel of boiling water. When it becomes dry, add two cups of milk and cook until it is all absorbed. Stir in a spoonful of butter and take from the fire. When cool mix in two well beaten eggs, three tablespoonfuls of corn-starch or flour, a little salt and nutmeg. Flour your hands, make into flat cakes, dip into flour and fry in hot fat. Eat hot or cold with hard or liquid sauce. Very nice.

Puff Puddings.

One pint of new, rich milk, the whites of four eggs beaten to a froth, one coffee-cupful of flour, a large teaspoonful of yeast powder, a small cup of powdered sugar, a little salt and the grated peel of half a lemon. When the whites are beaten stiff, whisk in the sugar and add, by degrees, to the milk with the flour (the yeast powder sifted with it.) Beat hard for a few minutes, and bake in buttered cups. Try with a small splinter. When done, turn out, sift sugar over the top and eat with sweetened cream or lemon sauce.

Jellied Tongue.

A large beef's tongue, boiled and cold, two ounces of gelatine dissolved in one-half pint of cold water, one pint of liquor in which the tongue was boiled, a tablespoonful sugar, a little burnt sugar for coloring, juice of a lemon, a pint of boiling water. To the liquor, sugar, juice, and burnt sugar dissolved in a little cold water, add the dissolved gelatine, mix well then pour in the hot water and strain. The tongue must be skinned and cut into slices thin as a wafer. Wet a mold or fancy dish large enough to hold all, in cold water and when the jelly begins to thicken put a little in the bottom of the dish then a layer of tongue, more jelly and tongue until both are used. Cover and set in a cool place. When you wish to turn it out, dip the mold for an instant into hot water before inverting. Garnish with the blanched leaves of celery. This is a very handsome dish for an "extra" occasion.

Codfish and Cheese.

Just bring to a boil, a pound of freshened codfish, chop fine, and stir in a cup of drawn butter, season with pepper and a little minced parsley or celery leaves and two tablespoonfuls of grated cheese. Turn into a baking-dish, strew fine bread-crumbs on top, and brown in the oven.

Fricassee of Sweetbreads.

Procure four nice sweetbreads, wash them carefully, removing skin and gristle. Cover with boiling water and boil 15 minutes, then plunge into ice-cold water, to which you have added a little salt. Leave them in this 20 minutes, take out and cut into crosswise slices, quarter of an inch thick. Have ready three or four tablespoonfuls of butter heated in a frying pan and fry the slices until nicely browned but not burnt. Into a sauce-pan turn two cups of strong broth, seasoned well with salt, pepper, a dash of Cayenne, cloves, a little chopped onion boiled in it and strained out, and thickened with browned flour. Put in the sweetbreads, cover and simmer 15 minutes longer. MARY B.

Apple Pie a la transcendental.

Make an apple pie with two crusts, but without sugar or spice. Bake it, and when nearly done, beat up two eggs, with sugar, spice and butter or any other seasoning preferred. When the pie is done, take it out of the oven, slip off the top crust on to another plate, stir in the egg and seasoning till it is well cooked put on the top crust exactly as it came off, and serve. Everybody will want two pieces.

CHIEF COOK.

Mountain Cake.

One pound of flour, one pound of sugar, one-half pound of butter, one teacupful of sour milk, six eggs, one teaspoonful of soda, two of cream-of-tartar. Bake as jelly cake and spread frosting between and on top.

Ginger Cookies.

Two cups of molasses, one of sugar, one of fried pork drippings, one cup of buttermilk, one-half cup of ginger, one tablespoonful of saleratus. Careful not to mix too stiff. Cut in square cakes.

Fried Cakes.

Two cups of buttermilk, two eggs, a lump of butter the size of an egg, two cups of sugar, one teaspoonful of saleratus, a pinch of ginger. Fry in hot lard.

Pork Cake.

One pound of salt pork chopped fine. Let boil two minutes in a half pint of hot water. Add one cup of molasses, two of sugar, three eggs, two teaspoonfuls of soda, one teaspoonful of cinnamon, one of cloves, nutmeg, one pound of raisins, chopped. Flour to make a stiff batter.

Sugar Cookies.

One and one-half cup of sugar, one-half cup of butter, two eggs, tea-spoonsful of soda dissolved in two tablespoonfuls of sweet milk, one teaspoonful of cream-of-tartar in the flour. Cut into round cakes. M. J. STEWART.

Lazy, drowsy feelings are precursors of sickness, which Hop Bitters will instantly banish.

Wanted.
The address of a good honest working man, that would be willing to come to Ohio. A man of a family, and under 35 years of age. To such I would give steady employment.
O. F. BENTON, St. Marys, O.

News of the Week.

HOME NEWS.

MONDAY, Feb. 7, 1881.

Great preparations are being made in Washington for the inauguration ceremonies. The money necessary for carrying out the plans of the Inaugural Committee has nearly all been subscribed. The new National Museum, in which the ball is to be given, is a building of one room but little less in size than the National Capitol, covering 3¾ acres of ground. A fine dressed-pine flooring is now being laid throughout the hall, which will be waxed. The limit of the number of tickets of admission—8,000—provides for about six square feet for each person, which will prevent the hall from being overcrowded as is generally the case. A band of 150 musicians from the East has already been contracted for. In view of the expense attending the preparations no complimentary tickets will be issued, excepting to President-elect Garfield and family. The work on the decoration of Pennsylvania avenue will be commenced at once, $10,000 having been given for that purpose. The escort of the President-elect will consist of about 2,000 militia and 14 companies of regular troops and marines. Previous to the ball a reception will be held in the museum building by General and Mrs. Garfield, President and Mrs. Hayes and General Grant and Mrs. Grant. General Hancock has also been invited to take part in the reception, and it is thought, from assurances received by the Committee, that he will accept. General Sherman will be Grand Marshal of the parade, and will make the presentation at the reception.

Now, while our law-makers at Washington are taking a moment's respite from cabinet speculations, they are devoting their spare moments to a consideration of who shall be Speaker of the next House. Mr. Kasson, now Minister to Vienna, has been a prominent candidate; Mr. Robeson would like to be consoled with the Speakership, but he is a temperance man; Mr. Burroughs, the comic man from Michigan, would like to tickle the house from the Speaker's chair; Mr. Kelley (not John) of Pennsylvania, would not object to the place, while Mr. Frye hardly knows which to aim for—the Speakership or a Senatorship. If no one else will take the office under consideration, New York will humbly propose the name of Frank Hiscock.

In the Senate Mr. Wallace has introduced a joint resolution proposing an amendment to the Constitution of the United States changing the mode of electing the President and Vice-President of the United States. The bill dispenses with the Electoral College and provides for an election by the people by secret ballot, by direct vote, in districts. Each State is to have as many districts as it has Senators and members in Congress, and each district to have one vote. The vote to be canvassed by a State Board of Canvassers, consisting of the Governor, Chief Justice and Secretary of State, their returns to be made to the Speaker of the House, and to be conclusive proof of the result. The votes are to be counted by Congress in joint convention, and a plurality vote to elect.

A special Committee of the Senate has had under consideration a bill providing that the principal officers of the executive departments may occupy seats on the floor of the Senate and House, with the right to participate in debate on matters relating to the business of their respective departments, and that either House may require their attendance at its pleasure.

A fire in Philadelphia recently destroyed the Beth Eden Church, Horticultural Hall and private residences. Loss, $213,000, insurance, $60,000.

Gov. Cornell, has been to Mentor, but his visit there, he says, had no political significance, but was simply of a social nature. Mr. Garfield, probably, had not the least suspicion a year ago that he had so many friends, who were so extremely anxious for his welfare.

The managers of the late pedestrian contest in this city, have paid the five men, entitled to a share in the proceeds. Hughes, the winner, received a check for $4,220, Albert, was made happy with $2,414, Vint got, $1,207, Krohne, $804, and Howard, $402.

It is stated that several English bicyclists are to visit this country next Summer, for a run through the principal cities. Our masters of the wheel will doubtless extend them a cordial welcome. Bicycling is the coming sport, and next season some fine parade riding may be expected.

The Sacramento River has this Winter reached the highest point ever known, viz., 26½ feet, or one inch higher than the flood of 1878, the water on the Colo side washing over the levees and cutting them out badly. Above Sacramento City the water poured over the levee through a break of 200 feet. A short distance below the city there was another break of 100 feet, and below the city for eight miles the water poured over the levée, putting the whole country under water. The damage will amount to fully $1,000,000, principally to orchards and vineyards.

Gentlemen interested in the reform of the present divorce laws met in Boston Monday afternoon and organized a New England Divorce Reform League. Governor Long, Paul Chadbourne, President Woolsey of Yale, President Chamberlain of Bowdoin, Judge Jeremiah Smith of Vermont, and other prominent gentlemen were selected as members of the League.

The census shows that the people of New York City own over $176,000,000 worth of the four and a half and five per cent. bonds; Chicago, about $6,000,000; Philadelphia, $26,000,000; Brooklyn, $4,500,000; Boston, $20,000,000; St. Louis, $3,000,000; Baltimore, $6,000,000; Cincinnati, $4,000; San Francisco, $10,000,000, and New Orleans, $2,000,000.

Elisha Gray, the inventor of the telephone, is said to be receiving an "enormous revenue" from his invention. As he is a remarkably generous man, he finds no difficulty in getting rid of a good deal of it. He is about to give a course of lectures on dynamic electricity at Oberlin, Ohio.

At a late meeting of the World's Fair Executive Committee an address to the different States was presented urging prompt action in the various State Legislatures concerning proper representation at the Exhibition.

It is hoped that a street of States, similar to the street of Nations in the main building at the Philadelphia Exhibition, may constitute an imposing feature. A statement of the subscriptions to date will soon be made public.

The death of J. Lewis Diman, D.D., Professor of History and Political Economy in Brown University, Providence, R. I., is announced. He was born at Bristol, R. I., May 1, 1831, graduated at Brown University in 1851 and at Andover Seminary in 1856. After several years of travel in Europe, and after having filled two pastorates in Massachusetts, he was elected Professor of History and Political Economy in Brown University. He has taken high rank as a scholar and orator, and many of his addresses and articles have been published in the leading reviews.

Mr. W. A. Ingalls, of the Ingalls Man'f Co., Providence, R. I., sailed on the steamer Britanic, White Star Line, Feb. 5, for a trip across the ocean, and for the purpose of establishing a manufacture of some of his inventions on the other side.

The joint convention of Senate and House of Representatives met on Wednesday last to count the electoral votes for President and Vice-president. The certificates of election were taken up, by States, in alphabetical order. The voting passed off quietly until Georgia was reached when Mr. Springer demanded that the certificate of that State be read in full. The vote of Georgia was cast on a day other than that fixed by law, wherefore, under the concurrent resolutions, this vote was not recorded until it was ascertained whether the counting or omitting to count its vote would change the result of the election. The remaining certificates were read without interruption and when the list was completed Senator Thurman who was one of the tellers made the following announcement: "The tellers report that the whole number of Electors appointed to vote for President of the United States was 369, of which a majority is 185. Were the votes of the Electors for the State of Georgia, cast on the second Wednesday of December, 1880, being the 8th day of said month to be counted, the result would be: For James A. Garfield, of the State of Ohio, for President of the United States, 214 votes; and for Winfield S. Hancock, of the State of Pennsylvania, for the President of the United States, 155 votes. If not counted the result would be: For James A. Garfield for President of the United States, 214 votes; and for Winfield S. Hancock for President of the United States, 144 votes. In either event James A. Garfield has received a majority of the votes of the whole number of Electors appointed" Senator Thurman then made a similar statement relative to the vote of Vice-president. Immediately following this announcement the Vice-President made proclamation of the result and the convention adjourned.

The Pennsylvania Railroad Company sent a letter to the Emigrant Commissioner at New York, stating that they will reduce the immigrant passenger rates to Chicago to $3. This shows what a little competition will do.

Mr. Blair has introduced in the Senate a joint resolution proposing an amendment to the constitution, which was read. It prohibits, after the year 1900, the manufacture and sale anywhere within the United States and Territories of distilled alcoholic and intoxicating liquors, or any intoxicating liquors mixed or adulterated with ardent spirits or with any poison whatever, except for medicinal, mechanical, chemical and scientific purposes. It also prohibits the exportation and importation of such liquors and their transportation through any part of the United States, except for medicinal and scientific uses, &c.

The Ætna Life Statement.

We extract, from the comments of the Hartford papers upon the Ætna Life Insurance Company's annual statement, the following:

The Courant says:—"The figures speak volumes of commendation for the excellent management. The year has assuredly been a prosperous one with the Ætna, and the showing of figures is sound proof that there is no better company in the country in which to insure. Such an institution as this is one for which Hartford may be justly proud."

The Times says:—"The stupendous business of the Ætna Life has been built up by the most energetic but at the same time cautious methods, and sound principles of finance are the foundation upon which its colossal success has rested"

The Post says:—"The past year has been a continuation of the Ætna's successful career With its efficient management, it may reasonably be expected to continue the increase of its large and prosperous business. The Ætna is unquestionably one of the strongest and best life insurance companies in existence. Its management from the outset has been eminently conservative, giving it a reputation that any company in the world might honestly feel proud of. Successful as its past has been, its future career will ever exceed the past in point of success."

[Muscatine Journal.]

Two Days' Work.

Two day's moderate application of the means in question, enabled Mr. Otto Eichhorn, 1413 N. Ninth street, St. Louis, Mo., to thus write us: I had been a sufferer for the past six weeks with severe pains in the shoulder and spine so that I was unable to do my work. Advised by a friend I used St. Jacobs Oil. With the second application relief was had and a cure effected in two days.

AGRICULTURAL NEWS.

Harriet Beecher Stowe is reported to have lost all the orange trees on her Florida plantation, amounting to about 100,000, by the late extreme cold. Doubtless this is somewhat exaggerated. .....The cotton-seed oil manufacture is now the leading industry of New Orleans, its six mills employing 1,525 persons and producing $2,742,000 worth of oil annually. There are nine mills in both Mississippi and Louisiana, eight in both Tennessee and Texas, four in Arkansas, two each in Missouri and Alabama, and one in Georgia. They all can crush 1,785 tons of seed daily. The 47 mills in the whole country only crush an eighth of the seed available for oil, their annual oil product being valued at about $6,000,000. Oil-cake is also a valuable product of these mills.....Albany, N. Y., is to have a new grist mill to grind according to the Hungarian process. T. O. Shepherd owner..... ...Minnesota has appropriated $3,500 in five years to encourage tree planting, and the State Forestry Association reports that millions of young, thrifty forest trees, standing in hundreds of artificial groves, are now scattered over their broad prairies.....An English company, with a capital of $2,500,000, has been organized for the purpose of establishing a line of ocean steamers for the tranportation of cattle from this country to England. Four steamers of the proposed line will be built soon..... ..... Mr. Chamberlain, Sec. for Home Affairs, stated in the House of Commons last Wednesday, that there was no law under which the importation of oleomargarine and like compounds into Great Britain could be prohibited.....The Minn. Cane-Growers' Convention resolved to send a barrel of sorghum sugar to President-elect Garfield, with an appropriate resolution.

The seeding of Fall wheat in South Russia was effected under generally favorable conditions, but the luxuriant growth of the wheat plant and the want of snow caused some apprehension, but not, however, very serious.....During July, August, September, October and November we exported of wheat, and flour calculated as wheat, 97,424,198 bushels, against 103,951,889 bushels in the same period last year.. .....Reports of the Illinois Department of Agriculture, obtained from 500 points in the State, show that the growing Winter wheat crop covers 3,049,631 acres, against 2,790,080 acres in 1880. It is believed that the crop, as a whole, is in excellent condition, and, from the present outlook, it will be a good fair average at least, and perhaps will be better than the average.... ...The sorghum product in Minnesota last year was about 50,000 pounds of sugar and 50,000 gallons of sirup, the former selling in market at nine cents a pound and the latter at 55 cents a gallon.

David Dows and some other large grain dealers say there is no "corner" in oats here, or in wheat in Chicago. Well, probably not.....Some of the Chicago papers contain long lists of the leading buttermen, who pledge their words never to sell any of "the vile compounds" oleomargarine and sucine....A Mass Meeting of Wisconsin farmers was held at Madison from January 31 to February 4.....The Wisconsin State Grange held its annual meeting at Milwaukee last week. It was advocated that the head of the Department of Agriculture should have a seat in the Cabinet; that railroads should make no discrimination in freight against persons or places; that they should receive no more grants of land; nor should their land be exempted from taxation; that the patent laws should be thoroughly revised; and a graduated income tax imposed; and that taxation on morigages on land should be credited to the notes or mortgages.

Mr. Aaron A. Degrauw, Jr., sold at his farm in Jamaica, L. I., at public auction, on Wednesday last, a large number of imported Jersey cattle. All the animals had undergone the ninety days' quarantine required by the United States authorities, and buyers were furnished with certificates of health and permits for removal. Forty-five head were disposed of, which realized in the neighborhood of $8,700, the prices paid, however, being considered quite low in many instances. Among the largest buyers were Benjamin Albertson, Jamaica, L. I.; Thomas S. Willetts, Flushing, L. I.; Dr. James Bathgate, Morrisania, N. Y.; N. T. Sprague, Brandon, Vt.; F. C. Havemeyer, N. Y.; John A. Cone, Great Barrington, Mass.; C. A. Willetts, Flushing, L. I.; A. C. Wheelwright, Boston; D. A. Givens, Cynthiana, Ky.; A. A. Degrauw, Sr., Jamaica, L. I.; J. D. Risher, Pittsburg, Pa.; E. P. Collin, Pittsburg, Pa., and W. E. French, Boston.

Hogs lower for the lower grades; light shippers', $5 35@5 50; mixed packing, $5 20@5 50; butchers' to fancy, $5 65@5 90. CATTLE in fair demand; market a shade easier; exports, $5 25@5 65; good to choice shipping, $1 50@5 15; fair to good $4@4 50; choice butchers' Steers, $4 10@4 50; fair to good, $3 50@4; stockers, $2 50@3 25; feeders' scarce and wanted at $3 50@4 35. SHEEP steady and unchanged; receipts, fair to good, $4@4 75; choice to fancy, $5@5 40.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 12, 1880.

BEANS AND PEAS.—During the past fortnight a decidedly better feeling has been developed in the standard white grades of beans; all good marks are held at the outside figures. Red kidneys are very dull and have the unusual chase of being the lowest item in the bean market. Green peas stronger; $1 70@1.72½ for Wisconsin. Southern B. E. peas steady at $2 per 2-bush. bag.

Marrow beans prime $1 95@2 00, do, other $1 80@1.90, medium prime $1 90, do other $1 70@1.80, pea $1.70@1.90, white kidney $1.80@2.00, red do, prime $1 50@1.60, do, other $1.25@1.45, black or turtle soup $1.50.

BEESWAX.—Transactions are small and prices unchanged: sales at 23½@24½c.

BUTTER.—The market is fairly strong for all table grades for local use and considering the scale of prices shippers are taking hold quite freely. There is considerable stock yet to come forward, but in the opinion of the trade almost all of the best State dairies have been picked up. Supplies come forward moderately but sufficiently for the present wants of the trade. State farmers this season have made a profit by holding, and unless the spring comes suddenly here is still a chance on fine quality receiving support at at least present prices. Western butter is arriving very good figures.

Creamery Western choice 34 good to prime, 31@33c; fair to good 28@30; State dairies, 25@30; early packed creamery, 29@25c, State dairies, choice entire, 25c; other, 20@24c; Orkins, 18@23c; pails and half tubs, fall, 28@ 9c; other, 18@23c; Western tubs, fall, 26@27c; other 18@21c Western imitation creamery, 3 @ 23c; Western dairy, fresh, 25@26c; good, 23@24c; other, 16@20c; factory, best, 23@24c; other 16@22c; very poor, 13@15c; roils slow with a light demand, 17@20c.

Receipts for the week, 21,075 pkgs.

Exports for the week, 10 0.8 pkgs.

CHEESE.—Export demand has been moderate only this week, the shipments being only 28,1.0 boxes. Prices have been fairly steady on strictly fancy stock, but otherwise buyers have had rather the advantage. Quotations are for

State factory, fancy, at 13¾c.; do, good and prime, 12¾@13¾c.; do, fair, at 11½@12c.; a, half skimmed, 10@11c.; Wisconsin factory, fine, at 13¾@ 13¾c.; do, good to prime, 13¼@13¾c.; do, fair to good, 11½@12¾c.; Ohio factory, fine, 13c.; do, good to prime, 12@12¾c.; do, flat, fair to good, 11@12c.; do, poor to fair 8@11c.

Receipts for week, 47,750 boxes.

Exports for week, 41,585 boxes.

Liverpool cable, 68s.

Steam to Gt. Britain, 30s.@35s.

COTTON—There has been a fair degree of activity and the market closed firm at, f'r

February, 11.25@11.27c. March, 11.37c. April, 11.52c.; May 11.66c.; June, 11.77@11.78c.; July, 11.86@11.88c.; August, 11.91@11.93c.; September, 11.46 11.48c.; October, 10.99@11.02c.; November, 10 84@10 85c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

STAINED.

Good ordinary	8¼	Low middling	10
Strict good ordinary	9⅛	Middling	11

Receipts for the week, 27,874 bales. Exports do. 6,540 do.

DRIED FRUITS.—Apples showed light sales of evaporated stock, with prices steady some dried lots are in fair demand and firm. Peaches are quiet, as also small fruits generally.

Evaporated apples at 8½@9c. for the better qualities; sliced apples at 5a6¼c. for good to choice North Carolina; 4@4½c. for Va, apples, 4@4½c. for Tenn. do; 4¼@5c. for State do; 4¼@5c. for western, Ohio and Mich. Peaches at 30@32c. for evaporated peeled; 14@15c. for unpeeled do.; N. C. peeled at 20@22c.; for the better qualities, unpeeled peaches at

6¼@6½c. for halves and 6@6¼c. for quarters. Plums at 15@16c. Blackberries at 8c. Cherries at 17¼c. Raspberries at 24c.

Receipts of all kinds for week, 1,760 pkgs.
Exports, including evaporated, 5,755 pkgs.

EGGS—Receipts for week 3,423 bbls; do. last week, 1,663 do. Supplies begin to show again and the market, with its usual sensitiveness responds with lower prices. One favorable feature is the fact that few off quality lots will afflict the trade this Spring after the cleaning out the market had during the "famine."

Near Points, ₱ doz., 30c; State and Penn., 29@29c.; Southern and Western, 27@28c.

FRESH FRUITS—Exports of apples for week, 5,114 bbls. The market for apples is irregular; stored stock is firm but the seeming bargains in fresh receipts restrict the demand. Mixed lots at station range $ @1.75.

Baldwins $1.75@2.00 Greenings, $1.50@1.75; Spitzenbergs, $2.00@2.25; Russets not generally opened. Cranberries quiet; extreme prices supported only in a retail way. Cape Cod fancy bbls, 48; other, $4@7; N. J. boxes 1.50@2.25. Florida oranges have a better inquiry for fruitless lots, but the remainder of the season will not compensate early bad movement; choice lf. and boxes $4; other, $3@3.50; frost-touched are at buyers' option. Hot-house strawberries, 60 per quart. Black Hamburg grapes, $1. Peanuts quiet with a liberal offering. The retail trade has been curtailed by bad weather. Va hand-picked, 4¾@4¾; other, 3½@4; shelled, 3¾@4¼. Hickory nuts now have no large buyers; nominally $1 per bush. of 50 lbs. Pecans begin to arrive freely; market easier, 6¾@8c.

FLOUR—Has been more freely offered at easier prices, but closed firm and active.

Latest prices are: $3.60@4.00 for very inferior to very choice superfine State and Western; $4.25@4.50 for poor to choice extra State and Western, odd lots and lines; $4.55@4.65 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4.35@5.25; good to choice do at $5.35@6.10, (very choice up to $6.25@6.50 and fancy at $6.50@6.75;) red and amber winter wheat inferior to choice trade and family at $4.35@6; round hoop Ohio, $4.40@4.75; and trade and family brands of [illegible] $4.80@6.25, the latter for fancy; St. Louis $4.00@5.00 for inferior to good extra; $5.50@6.35 for good to choice, and up to $6.75@7 for very fancy brands; Minnesota clear, inferior to very fancy at $4.30@6; Minnesota [illegible] poor to very choice, at $5.25@6.75, and patent inferior to fancy at $5.75@8.25; city mill extras $5.35@5.60 for fair to choice for the West Indies; do. for England at $4.25@4.65 for poor to choice spring wheat; do. trade and family extras, $5.65@6.75; do. for South America $5.70@6.85, the latter for very choice; No 1 at $3.15@3.65 for very inferior to fancy.

Receipts for week, flour, bbls, 104,175; corn meal, do, 1,350; wheat, bush, 355,850; corn, do, 216,612; oats do, 186,100; rye, do, 31,810; malt, do, 39,744; barley, do, 41,510; beans, do., 4,776; rice, pkgs, 2,660.

Exports for week: flour, bbls, 101,760; corn meal, do, 3,250; wheat, bush, 760,441; corn, do, 219,167; oats, do, 2,000; peas, do, 7,200; beans, pkgs, 474; rice do 1,050.

CORN MEAL—Sales at $2.65@3.10 for Western, and $3.25 for Brandywine.

GRAIN—In wheat exporters have taken this week 570,000 bush, demand has been very fair on speculative account, and at the close prices are strong; latest sales are of

No. 1 white at $1.15¼@1.16 do. February at 1.15½@1.16, do, March at $1.15¾@1.16¼, do. April at $1.16¼@1.17; do, May at $1.16@1.16¼; ungraded white at $1.12@1.16; No 2 red at $1.17@1.18½; do. February at $1.17@1.17½, do. March at $1.18@1.18¾; do. April at $1.18½@1.20; do. May at $1.18½@1.19½; No. 3 red at $1.15½, ungraded red at $1.16@1.20; No. 2 Chicago Spring at $1.15 afloat.

Rye is quiet at 97@99c,

Corn is in freer demand and closed firm at for New York No. 2 at 56½@56¾ do. do. February at 55¾@56¼, do. March at 55½@55¾, do. April at 55½@55¾, do May at 51½@54¾, ungraded mixed Western at 55@58; New York steamer mixed at 56¼, New York No. 3 at 55@56¼, No. 2 white at 58½@59 New York yellow at 51¼.

Oats are in very fair demand and prices ruling firm; latest sales are of

No. 1 white 49c New York No. 2 white at 47¼@47¾; No. 3 white at 45¾@46 New York No. 2 at 45@45½, do February at 45@45¼, do. March at 44¾@44½, do. April at 44½ do May at 44½ No. 3 at 44@44¼, ungraded white Western at 44@49, ungraded mixed Western at 43@45¼, white State at 47½@49¼, No. 2 Chicago at 45c bid.

HAY AND STRAW.—For hay demand is good and prices well sustained. Straw is plenty and freely offered. Quotations are for

Hay, prime timothy at $1.20@1.25 ₱100 lbs.; medium timothy at $1.10@1.15 do. shipping grades at $1@1.05 do.; clover mixed at $1.05@1.10, clover at 95c@$1. do. Straw—No. 1 rye at $1.5 ₱ 100 lbs.; No. 2 rye at 75@80c. do.; oats and wheat at 70@80c. do.

HOPS—Prices are very regular and without important change. Exporters have been buying moderately only, and brewers are doing little. Shipments for the week 363 bales, which includes parcels on through consignments; this makes the exports since the commencement of the crop year (Sept. 1) 81,796 bales, against 41,291 bales in the previous year for the same period. Quotations are for

	Cents per lb.
New Yorks, crop 1880, prime and choice	21 @23
Do. medium	19 @20
New Yorks, crop 1880, low to fair	16 @18
Eastern, crop 1880	18 @22
Wisconsin, crop 1880	18 @22
Yearlings, crop 1879, choice	14 @20
Olds, all growths	4 @12
Bavarians	30 @35
Pacific coast, new	20 @24

Receipts for the week, 4,322 bales.
Exports for the week, 1,208 bales.

HONEY—Continues dull at the late decline. White clover, comb, single, 14@15c.; larger pkgs. do. 12@13c.; buckwheat 8@9c.; extracted 6@9c.

LEATHER—Quotations are for hemlock sole, 22@23c. for light: 23@24½c. for middle: 23@24c. for heavy.

OIL-CAKE.—Western is in moderate demand; quoted at $29@29.25 per ton.

PROVISIONS—Hog products have been in good demand and tending stronger.

Mess pork quoted at $14.75@14.87½ for old and $15.25@15.50 for new. Bacon at 8¼ for long clear and 8¾ for short clear. Beef at $2@22 for city extra India mess, $9.50 for extra mess and $9.50 for plain mess. Lard—Western steam at 10.07½@10.10 for spot lots, 10.07½ for Feb., 10.07½@10.10 for March, 10.1@10.17½ for April, and 10.17½@10.20 for May. Stearine at 10¾ for choice.

Receipts for week, beef, bbls, and tcs, 733; pork, 4,900bbls.; cut meats, 88,712 pkgs.; lard, 26,525 pkgs.

Exports for week, beef, bbls, and tcs, 2,452; pork, 5,175 bbls.; cutmeats, 20,340,977 lbs.; lard, 5,642,617 lbs.

POULTRY AND GAME.—Supplies of prime turkeys have run light and prices are higher. The weather, however is mild and thawing, and there is no security for the continuance of good rates for any sort of dressed.

Prime turkeys, near by, range, 15@16c; other, 12@14½c, poor, 11c. Chickens almost the same as turkeys. Fowls, good to prime, 10@12c.; do. poor, 8½@9½c.; Ducks, 14@18c. Geese, 9@12c. Squabs, white, $4.50@5.00 do. dark $2@2.50.

Live poultry fluctuates according to the irregular supplies of Winter; early in the week sales were low, live fowls selling down to 8½c. Closing rates:

Fowls, 9@10c.; near by, 11@12c.; turkeys, 10@12c., roosters, 6@8c.; ducks, 50@85c. ₱ pair. geese, extra, $2; other $1@1.75; pigeons, 30@38c.

Wild ducks comprise the chief offering.

Canvas-back ducks, $1.50@1.75 ₱ pair, red-heads, 75c.@$1, mallard 60@75c; teal 40@50c, widgeon, 40@50c; common do 30@40c.

SEED.—Clover is firmer and in demand, quoted at 7¾@8c. Flaxseed quoted at $1.45, pure basis. Timothy is wholly nominal.

VEGETABLES—Exports potatoes for week, 335 bbls. It is expected that supplies of potatoes will soon be liberated and the market is a shade easier in consequence.

E Rose Eastern d.-h, $2.50@2.62, do. State, $2.37@2.50; do in bulk $2.25@2.37; Prolific do, $2@2.11; Mercer do. $1.87@2; Burbank d h, $2.25@2.37; Burbank bulk, $2.25; pearl blow d.-h. $2.50@2.62; do. bulk, $1.87@2; snowflake d.-h $2.37@2.50; do. bulk, $1.87@2; peerless d.-h, $2@2.12; do bulk $1.87@2; sweet $2.25@2.75. The season is growing into for stiff prices to rule for other vegetables; onions, usually the strongest item, have fallen off in price materially. Russia turnips, ₱ bbl.75c. white turnips 75c. beets.75c@$1; carrots, $1.25@1.50; marrow squash 50c; Hubbard do. $1; onions, white ₱ bbl $5.00@6 yellow do. $3.25@3.50; red $3.25; Chester, $3@3.25; cabbages, ₱ 100, $8@10; red, do. $9@11; celery ₱ doz. 75c@$1. Hot-house product—Cucumbers, choice, ₱ doz. $1@1.50; do. culls $1@2; lettuce, Boston, ₱ doz.75c@$1.12; do. N. J. 40@50c; do. culls, 12@25c; radishes, ₱ 100 bunches, $4; rhubarb, ₱ 100, $5@7.

WOOL.—Demand has been moderate this week with prices showing no important change, but ruling rather easy. Quotations are for

Ohio, Penn. and W. Va. fleeces 46@47c. for X, and 47@48c for XX 48@50c. for XXX and picklock.

Mich., Ind and Wis. at 42@44c, for X and XX, 47@48c. for No. 1, 38@43c. for No. 2 and common

N. Y. N. H, and Vt, at 39@42c. for X and XX, 45@47c. for No. 1, 37@42c. for No. 2 and common, 44@46c. for fine delaine.

LIVE STOCK MARKETS

NEW YORK, Saturday Feb. 12, 1880.

BEEVES.—Receipts for the week 9,109 head; do. last week, 11,955 do. The market has had only a light representation of stock since Wednesday until today. Although the arrivals included what should have been here on Friday, the market was extremely active, unusually so for Saturday, and a wet Saturday at that. Buyers evidently feared detention of trains next week, and rather than be caught short they endured upon usual purchases. The yards were cleared at an advance on Wednesday's figures. Common cattle 8@8½c. to dress 56 lbs; medium to good 8¾@9¼c. to dress 56 lbs; choice 10¾@11¼c. to dress 57 lbs. The market makes the best average of a long period.

COWS AND CALVES.—The feature of the week is a sale of a car-load to a Long Island farmer within the range $30@55.

VEAL CALVES.—Supplies have been liberal and prices are easier than for last week.

Choice fed live, 7½@8c.; good 7c.; poor 6@6½c.; Mt. Holly 4@8c.; buttermilk 3@4c. grassers, 2½@3c. dressed, hot, 10@11c.; other, 8@9½c., very common, 5@6c. "Bobs" or calves under 60 lbs. live, are seized by the sanitary police.

SHEEP AND LAMBS.—Receipts for week, 22,342 head; do. last week, 27,321 do. There has been a good general trade and prices are satisfactory. Sheep 5@6¼c. Lambs 6¾@8¼c.

SWINE—Receipts for the week, 32,844 head: do. last week, 23,785 do. Demand fair, market steady.

Corn-fed live, $5.75@6.20 ₱ 100 country dressed pork, light, 8@8¾c.; medium, 7½@7¾c.; heavy, 7@7½c.; city dressed State, 7½@8c., city dressed Western 7¾@7¾c; Western dressed, 7@7¾c. Pork tenderloins, 11@11¾c.

STOCKBRIDGE MANURES
SEND FOR PAMPHLET.
These manures are the richest fertilizers now manufactured, and the best substitute for, and costing *much less* than guano, which is now practically out of the market. Unlike guano, they *are not stimulants* and *exhaustive*, but *permanent* and *lasting*, being composed of bone, potash, etc. You can draw at one load enough for 3 to 5 acres, or as much plant-food as is contained in 20 loads of ordinary straw manure. Corn, potatoes, hay, etc., are bringing such good prices that it will pay to use the Stockbridge extensively. If there is no local agent near you, send to us.

THIS ADVERTISEMENT WILL NOT APPEAR AGAIN.

Diamante Brilliants must not be confounded with the French paste and glass imitations, mounted in cheap gilt or plated settings, with which the country is flooded under the various fancy names given to so-called "imitation diamonds." **Diamante Brilliants** were exhibited side by side with *real* diamonds of *great value* at the Paris Exhibition and were awarded a Prize Medal, and the highest recommendation awarded to imitations. They attracted universal admiration, and immediately took the place of, and were intermixed with, costly diamond ornaments, and are now worn at the Court balls and upon all occasions among the best society in London, Paris, and all the capitals of Europe. **Diamante Brilliants** can be worn at all times, in daylight or gaslight, with perfect confidence and absolute security, as they possess all the brilliancy and penetrating lustre peculiar to real diamonds, and are the ONLY PERFECT SUBSTITUTE FOR DIAMONDS OF THE FIRST WATER. By their purity and brilliancy they bear comparison with old mine diamonds, and resemble them so closely that detection is almost impossible. They are superior in every respect to real diamonds of inferior quality. The investigations, experiments, and labor of two generations have been expended in bringing these remarkable jewels to their present state of perfection. They are produced chemically by a secret process, known only to the inventors, and they possess all the rare beauty of the gems they counterfeit.

PRESS OPINIONS OF DIAMANTE BRILLIANTS:

"Their lustre and brilliancy elicit universal admiration."—*Court Journal.*——"Products of perfect purity."—*Journal Society of the Arts.*——"Certainly far nearer in resemblance to real diamonds than anything we have seen."—*The Mechanic.*——"A great achievement."—*Land and Water.*——"The refractive power is equal to real diamonds of the purest water."—*World of Science.*——"They successfully fulfil all the purposes for which real diamonds (even of the first quality) are utilized."—*London Times.*——"Ladies who can afford to wear the real gem will henceforth reserve them for indoors, for since the advent of 'Diamante Brilliants' things are no longer what they seem."—*Boston Saturday Evening Gazette.*

The reputation of **Diamante Brilliants** is permanently established abroad, and we take great pleasure in bringing them prominently to the notice of Americans. To do so properly requires some nerve and a liberal outlay of capital. These magnificent stones are imported especially for us, and are set in SOLID GOLD, made in Philadelphia to our order, by one of the largest firms engaged in the manufacture of pure gold jewelry in this country. All the stones are set by professional diamond-setters, and as much skill bestowed upon them as with the precious stones. For the purpose of simplifying our business we use but three sizes of the New Diamonds. **The Ring, warranted solid gold, one-half karat stone. The Earrings, warranted solid gold, each 1 karat stone. The Stud, warranted solid gold, 2 karat stone.** The illustrations give an accurate outline of the style and setting, but no illustration or description can give an idea of their rare beauty. THEY MUST BE SEEN TO BE APPRECIATED. A RING, same style and quality of setting, but with an inferior stone, has never been sold for less than $4.00. We can safely say the same of the STUD; and EARRINGS, of inferior quality and style, have never been sold for less than $6.00. In London, to-day, Diamante Brilliants, same size stone and quality of settings, are selling for three to four times the prices named above, and we believe them well worth $5 each. SO MUCH FOR THEIR VALUE, AS WE WANT THIS CLEARLY UNDERSTOOD.

"What! all this trouble and expense about a Premium for your paper?" Yes, indeed! We can't select a Premium that will please everybody in a day, or a year, perhaps, yet we have expended so much time, thought, and labor on these—we are having the settings made, and the mounting under our own roof almost—we feel emphatically they will make every recipient happy. We are ambitious to give THE POST the largest circle of readers of any weekly on the Continent, and we propose to work for it, spend money for it, and use every honorable means to attain our object. THE POST is not an experiment; it is the oldest literary and family paper in America—now in its sixtieth year—and our **Superb Diamond Premium** offers deserve more attention than the many tempting promises of irresponsible parties. THE POST is a large, sixteen-page weekly, and aims to interest every member of the home circle. *At $2 a year it is the cheapest paper in existence to-day.* THIS IS NOT A CHEAP JEWELRY ADVERTISEMENT. **We don't sell Diamante Brilliants; we give them away to Subscribers, and to Club Raisers for THE POST.**

TERMS:—**The Post**, one year, and your choice of the **Premiums**, as a sample, to any address in the United States on receipt of **$2** and nineteen 3-cent stamps prior to **April 30, 1881.** A **club of two** subscribers to **The Post**, one year, accompanied by **$4**, entitles the sender to either the **Ring, Stud, or Earrings, Free.** A **club of three**, one year, and **$6**, entitles the sender to **any two** of the three premiums, **free.** A **club of four**, one year, and **$8**, entitles the sender to the Ring, Stud, and Earrings, **free**; or, for **$4**, we will extend your subscription **two years**, and send either Ring, Stud, or Earrings as a premium, **free.** For **$6**, will extend subscription **three years**, and forward any two of the articles as a premium. For **$8**, will extend subscription **four years**, and send all three premiums, **free.** All premiums sent by registered mail. Postage on paper and premiums prepaid in every case. NOTE.—*If the premiums are not as represented in every particular*, return them at once, and we will return your money promptly. THE POST has *never* missed an issue, and as to our reliability we refer to any bank, express office, or reputable business house in Philadelphia. ☞ All premiums will be withdrawn May 1st, 1881.—Size of finger can be obtained by cutting a hole the proper size in a piece of cardboard.—Remittances may be made by P. O. Money Order, Registered Letter, or Bank Draft.—Specimen copy of THE POST to any address on receipt of a three-cent stamp. Address,
THE SATURDAY EVENING POST, 726 Sansom Street, Philadelphia, Pa.

Reading for the Young.

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

ALICE P. ADAMS.

Live-Oaks and Other Trees.

"I HAD an idea," said Daisy one afternoon, "that there were woods all around you. On the contrary, I see there are very few trees on the Alhambra that have not been planted."

"Yes," replied Mrs. Erman smiling, "before it became civilized the Alhambra was a nearly treeless plain. There were a few scattering live oaks, but nothing else relieved the barrenness. A little north of us, however, you will find plenty of oaks. At Pasadena there is a fine grove on the slope of a hill, and in Wilson's canyon there are grand old trees wreathed in wild grape vines. Violet, we must take Daisy through the canyon the next time we go to Pasadena."

"Very well, mamma, we'll remember and go that way. But Daisy need not wait till then to see a live oak. Ours in the *corral* is nearly as large as any in the canyon. Come on and see it." So out of the house the girls skipped into the delightful March sunshine.

"There were six oaks on the place," Violet explained, "but five of them were out in the orchard, and papa was afraid they would injure the orange trees, so he had them cut down, and we have only this one left."

"This one" was a handsome, well-proportioned tree with spreading branches, standing in the middle of the *corral* or "barnyard" as Daisy insisted on calling it.

"I don't know what we would do without this tree. It is so nice and shady for the horses in Summer."

"What makes it so even on the under side?" asked Daisy. "It looks as if it had been trimmed."

"Ha, ha!" laughed Violet, "it *has* been trimmed, but the old cow did the pruning! She is very fond of the leaves and young branches, and nips them off as far as she can reach."

"It doesn't look at all like an oak tree. The leaves are so small and such a different shape. Does it have acorns?"

"Yes," answered Violet, "but they are longer and more pointed than common acorns. The horses like them very much, and will follow me all around the *corral* if I hold out an acorn to them."

"Why should the tree be called a *live*-oak?"

"I suppose because it is never bare. The old leaves stay on all Winter, and fall in the Spring after the new ones come. The old leaves are falling now; in a few weeks they will all be gone, and the tree will be twice as pretty, the new leaves are so bright and glossy and free from dust."

"What do you call those tall slim trees?" inquired Daisy, pointing to a row that surrounded the *corral* fence.

"Those are Eucalyptus trees; people commonly call them "Blue Gums." The leaves have a peculiar odor; come and see if you like it."

Daisy picked a few and presented them to her nose, but dropped them quickly while her nasal member assumed an expression of disgust.

"Ugh! Isn't it horrid? I shouldn't want those trees very near the house!"

"Oh, I have become so accustomed to it that I don't mind the smell; papa uses the leaves for rheumatism and I believe he thinks they are a panacea for every ill. But do you notice, Daisy, the two kinds of leaves on the tree?"

"So there are. I was taken up with that delightful perfume, and didn't think of anything else. Why should there be two kinds?"

"I'm sure I don't know, only such is the case. The lower leaves, which you see are rather broad, are the growth of the first year or two; while the long slender leaves do not appear, usually, until the tree is about two years old."

"How old are these trees, Violet?"

"A little over three years old, and you see the tops are way above the oak tree. Papa planted the seed the Thanksgiving Day after we came. I think the Eucalyptus trees grow faster than any others, and that is probably the reason so many are planted."

"Violet!" called Mrs. Erman, "where are you?"

"Out here by the *corral*," answered Violet. "We are talking about the trees."

"Well, Daisy, if you want to see something beautiful, come here and look at my pepper tree."

The girls walked toward the house. "I wanted to ask about that tree," said Daisy, "but everything is so new, and I have asked so many questions that I should think you would be tired of answering."

"Mamma is always ready to talk about pepper trees," interposed Violet; "I believe she likes them better than any others."

"Yes, I do," said Mrs. Erman, "orange trees not excepted. Nothing can be more graceful than a fine, well-proportioned pepper tree. Its red berries, drooping branches, and delicate leaves, which sway in every passing breeze, have a charm for me that no other tree can give."

"I always admired weeping willows, but this is a great deal prettier," said Daisy.

"Yes, and it has an advantage over the willow. This is an evergreen, while the willow looks most desolate in Winter when stripped of its leaves."

"Do the berries always come in the Spring?" inquired Daisy, reaching up to pick some of the crimson beauties.

"No," replied Mrs. Erman, "if you were to observe a row of street trees, next to the one bearing berries you might find one laden with the small, white blossoms, and very likely, the next might have green berries."

"Do the pepper trees grow as fast as the Eucalyptus trees? You see, perhaps, we may come to California to live, and then we shall want to know all about these things.

"I wish you might all come, dear child. No, the pepper trees do not grow as fast. This was planted at the same time the Eucalypti were, and you see it is not more than half as tall. Still it grows rapidly compared with trees in the east. Now, Daisy, whenever you feel like it, go down in the orchard, and ask Mr. Erman about the orange trees. He can show you the different varieties, and tell you about them much better than I can."
—To be continued.

FARMING FOR BOYS AND GIRLS—NO. 12.

HENRY STEWART.

Composts.

No farmer ever yet had enough of manure. It is the trouble of every careful farmer to supply this want which never can be satisfied in the usual way. He gathers from swamps, from woods, from roadsides, and every other source that he can reach, and the muck, the leaves and the scrapings which he thus collects, he works up into composts in such a way as to cause them to decay and become fit for plant food. The term compost is derived from a latin word *compositum* which means put together and expresses precisely the action of the farmer in this business of making manure of substances which alone would be of no value to him. The effect of this action depends upon a natural law the result of which is the conversion of organic substances into their elements. This process is what we know as decay or decomposition. The meaning of the word decomposition is, a taking apart of a compound substance. It is always accompanied by heat which is always produced by chemical action and decay or decomposition is the effect of chemical action. Decomposition is in fact a slow process of burning as much so as if fire were used to produce the result. The final effect is the same in both cases, the mineral matter or ash only being left.

When the farmer forms a compost he gathers these substances and makes them into a heap, and to hasten the end which he has in view he adds to it, evenly mixed through the heap, a certain quantity of fresh manure. This begins to heat very soon, and just as the yeast mixed with the bread sponge of the baker, starts the fermentation through the whole mass, so the small quantity of manure starts the heat and fermentation through the whole of the heap of the compost. But to produce the best effect there must

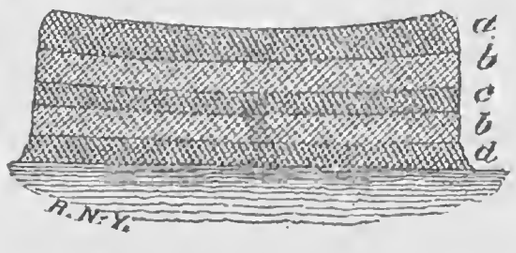

FIG. 105.

be a certain supply of moisture, for unless there is sufficient water in the mass the process of decay will not go on. Dry matter may be preserved, and will not decay, for many years; and until it is moistened with water it will suffer no perceptible change. The compost heap must, therefore, be made of such a shape that it will hold as much moisture as possible.

It is usually put up about four feet high and as long and broad as may be convenient, with the top made flat and hollow to collect and hold the rain which falls upon it. Lime is often added to compost heaps and is very useful, because it helps to decompose the vegetable matter in them and makes the compost fit for use sooner than it would otherwise be.

The usual time for making compost heaps is in the Fall, so that there may be ample time during the Winter for it to be made ready for the Spring work. By carefully gathering and saving all the materials mentioned, and working them up into composts, the quantity of manure may easily be doubled and the crops enlarged in proportion. One load of well-made compost may be as useful as the same quantity of common manure, and as it is always in a well broken and fine condition, it is the most valuable fertilizer that can be procured for spreading upon grass lands.

Composts may be greatly enriched by the addition of the manure from the poultry house, by the wastes from the house, and by ground or burned bones. In this way very valuable manure may be made for gardens or fruit trees, if nothing else can be procured for the basis of it than common soil. The soil is an excellent absorbing material for the richer qualities of the other substances, which by themselves would be too strong and rich for use. In making a compost heap the farmer first spreads a quantity of the coarse materials, such as swamp muck, leaves and sods, on the ground, of an even thickness, but more than a foot in depth. Upon this is spread some fresh manure, well broken up with the fork; then a layer of the coarse stuff and some lime or wood ashes may be mixed with it. Upon this more manure is placed, and then the heap is finished with some coarse stuff and some manure mixed together. The top is then leveled off and hollowed so that the rain that falls upon it will remain and be absorbed. The above engraving shows the right shape for a compost heap.

A PROPOSITION.

I AM sure there are good letter writers among the RURAL Cousins, and there are, doubtless, some young artists and mechanics among them also. Now in order to bring out this "latent talent," I propose to give a nice book of poems as a prize to the member of our Club, who, within three months, sends the best drawing (outlines simply) of any useful or ornamental farm or household article. If the diagram represents something invented by the one who draws it, this fact will be taken into consideration in awarding the prize. A description must accompany each drawing, clearly explaining the construction and use of the article represented, and accuracy in drawing must be the aim. The diagram and description which best fulfill all conditions, will be inserted in the RURAL, over the name of the successful competitor. Now, boys and girls, sharpen your pencils and your wits and let's see who'll win the prize. UNCLE MARK.

LETTER FROM THE COUSINS.

DEAR UNCLE MARK:—I have long wanted to join the Horticultural Club, so if you will let me I will do so. I like so much to read the letters from the cousins about their flowers and pets. My mamma had a good many flowers last season, such as roses, hollyhocks, phloxes, portulacas, geraniums, &c. Pa takes the RURAL, so we got the seeds that you sent us last Spring. But we had bad luck with them; the dry weather caused all of the flower seed to perish after they were planted. The oats were very fine, but the telephone peas did not amount to much on account of the drought. One of the Cuthbert raspberries lived. We were so much disappointed in not saving the magnolias and Dutchman's Pipe, as we expected to have an arbor over our front door made of the latter. I hope we will have better luck the next time. We have some pets also. Our big dog Carlo is very wise. We can send him to the house (if we are in the field) any time we want him to go. He will carry a large basket or bundle anywhere we want him to; he is very good-natured. Pa has a colt that used to open the kitchen door every time we let the string of the latch be on the outside. She would put her head into the door and beg (in her way) for salt or bread, which the children would give her. Kitty used to have to keep the string inside to have any peace while at her work.

We have on our place an old stone chimney which is nearly 300 years old. The fireplace is so large that we can sit in the corners of it while the fire is burning. It would hold half a cord of wood. It is called Powhatan's chimney, and was built by old King Powhatan, by order of Capt John Smith, the same who had his life saved by the young and pretty Pocahontas. My little cousins can read about these things in the history of our country. Pa has an old history that gives the account of the building of the chimney and everything about it. A good many people come here to see it; it is considered a great curiosity. CLAUDE IRWIN.

Hayes Line P. O., Gloucester Co., Va.

DEAR UNCLE MARK.—We live in the Rocky Mountains about fifty miles from Denver and South Park railroad. Papa takes the RURAL and we like it very much, especially the letters. I am very fond of gardening but I leave my little sister to raise most of the flowers as she likes them so much. I am very fond of hunting and fishing. I have a Winchester rifle with which I killed my first deer last Fall. We have some wild animals about, sometimes the wolves and mountain lions come around the house at night, but we do not often see them. I am thirteen years old and sometimes have considerable work to do.

CHARLEY M. TAYLOR.

SERMON OF THE SNOW.

With the softness of silence, unceasing, though slow,
In the low, leaden light comes the crystaline snow.
So untiring it seems, so impartial withal,
And so chastening to all that it touched in its fall
It appears as if dropped by the kind Father's hand
As a mantle of charity over the land!
While its thick woven webs hide the Giver on high,
Every stain on the earth is concealed from the eye;
And so bounteous the benison to mortals below,
From the earth to the sky there seems nothing but snow;
Since the sweet boon of Charity, never alone,
But in multiplied blessings is dropped from the throne,
So the snow that to-day robes the earth in the pride
Of a blooming young maiden arrayed as a bride,
Will to-morrow be torn by the boreal blast;
Will be worn by the wanton south wind wooing past;
And its beauty be lost and whiteness undone,
By the light, loving smile and warm kiss of the sun;
Then, resolved into tears—as the new life is found—
It will faithfully serve the great need of the ground,
And at length, in the rounds of the fleet-footed hours
Come to bless us again in the birth of the flowers?

A SUNDAY AT VERONA.

IT was on a rainy Saturday towards the end of September, that a party of English travelers arrived at the venerable town of Verona, in Northern Italy, intending to spend the Sunday there. The guide-book had mentioned that there was Protestant service held in the town, and this was in itself an inducement to choose Verona for the Sunday's resting place; for the uncertainties of traveling incline one to embrace with special readiness all opportunities of public worship.

Upon inquiry it proved that the Protestant service spoken of was in connection with the Italian Vaudois. The next day was gloriously fine and bright, as towards mid-day we set out on our quest for the Vaudois church. The sun beat down fiercely, but it was only in the open squares that one became aware of its full power, the narrow streets and projecting roofs affording elsewhere a grateful shelter. On we went for some considerable distance, passing under the shadow of the immense amphitheater, that glorious old building which for more than fifteen centuries has stood overlooking the city. Now, the crannies of the massive firey stones are being filled up with tufts of the little common maiden-hair—an innocent-looking covering enough for a building originally destined to such savage uses as an amphitheater.

Passing through one or two streets we found ourselves in a narrow alley, on the right-hand side of which was an archway leading into a garden. We mounted the stairs, and at the top found ourselves in a not very large room, fitted up something after the manner of a lecture-room, with a platform at one end and rows of desks facing it. Here some thirty or forty people were assembled, belonging mainly, to judge from their appearance, to the respectable middle classes. Whole families were there—fathers, mothers, and children. The occupants of one of the seats readily made room for the strangers, and placed at their disposal some of the Bibles and hymn-books with which each seat seemed to be amply provided.

The absence of all ornament whatsoever, the austere plainness of the room, was in striking contrast with the Romanist churches of the town, all of them highly decorated in some form or another, but one or two of them going to a point of elaborate tawdriness unusual even in continental churches. One could well understand that the excessive attention paid all around them to the externals of worship, should have driven the Protestants to the other extreme of excessive simplicity.

In a few moments the pastor entered and took his place at the raised desk, from whence he began to read aloud Psalm cxviii., the congregation diligently following in their Bibles. A long extempore prayer was then offered up, the congregation all standing for this, and sitting during the singing of the hymns, as in the French Reformed Church.

A chapter from the Second Epistle to Timothy was then read, and after another hymn had been sung, the pastor began his sermon. Taking his text from the chapter just read. "The Lord knoweth them that are his," he drew out at some length the difference between the "sons of God" and the "daughters of men." Calm and quiet when first he began, his kindling enthusiasm showed itself in voice and manner; his utterance becoming more rapid, his gestures more impassioned; reaching a climax at the end of a sentence and subsiding into quietness, only to rise again as before. The close of his sermon was tender and beautiful, as he depicted the blessed security of those sheep upon whom the Shepherd hath set His seal, that seal which causes Him to know them for His own whatever the sorrows and cares to which they may be for a time exposed. The sermon ended, the pastor once more prayed, first for the nation and for all in authority, and afterwards for the spiritual welfare of all men, and more especially of those now present, that they might receive forgiveness of sins and be fulfilled with all heavenly blessings. One more hymn brought the short service to a conclusion, and then a buzz of conversation arose, as friends greeted friends, and the pastor began to speak to one and another of the little congregation.

Slowly we left the shady up-stairs room, and passed out into the brilliant sunshine, carrying with us lasting memories of the earnest, simple worship of those "two or three" gathered together in the name of Christ. F. A.

Those old people whose blood has become thin and steps feeble are praising Hop Bitters for the good they have done them.

PERSONAL ITEMS.

Henry Lame, who acted as body servant to Gen. Mercer during the Revolution, died on Wednesday week at Mount Vernon, Ind., aged 123 years.

Victor Hugo looks well, but old age is beginning to show its effects. The white hair is thinning on the crown of the head, and the broad shoulders show a stoop.

Mr. Gladstone has been requested by 50 Liberal members of the House of Commons to leave the House early in the evening, and not participate in dilatory debates, owing to his poor health.

Mrs. Garfield is described as a graceful and slender woman, with brown eyes, brown hair dressed stylishly, a clear skin and delicate features. She has a good deal of personal dignity, but no obtrusive self-assertion. She is something of an artist herself and very fond of pictures.

The Infanta Isabella, the eldest sister of King Alphonso, was seriously hurt the other day while out with the hounds. Her horse stumbled and she fell off, striking on her head and being much bruised. She was plucky enough, however, to remount after her hurt had been dressed, and took an active part in the chase during the whole of the afternoon.

[Peoria National Democrat.]

The most eminent physicians of the day highly recommend St. Jacobs Oil as a cure for rheumatism. It can be purchased at any drug house, and the price is insignificant when you take into consideration the wonderful cures it will produce.

Trees, Seeds, Plants, &c.

Descriptive catalogue for spring of 1881, *free*. All persons who will need from a dozen to 100,000 Plants, Vines, or Trees, can save money by writing to me before buying of others.

J. S. COLLINS, Moorestown, N. J.

PURE SUGAR CANE SEED

The undersigned keeps a supply of Early Amber and Early Orange cane seed, the product of different latitudes; hence adapted to various climates. The Orange is especially recommended for sugar making and for districts subject to hot sun in July and August. It has received the indorsement of the Mississippi Valley Cane Growers' Association at its late meeting.

Prices of seed at St. Louis: Early Amber, by mail, 3 pounds, $1; by express or freight per pound, 15c.; large lots, 10c. Usual discounts to the trade.

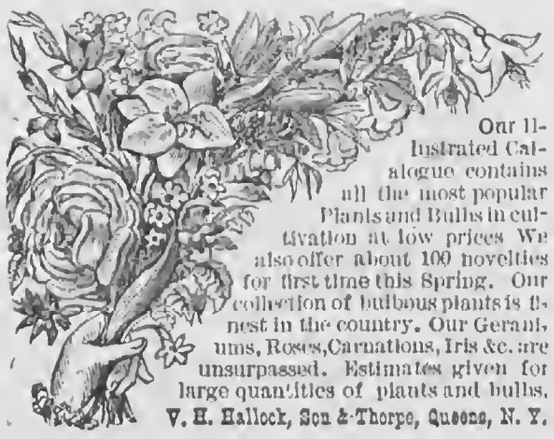
Early Orange, by mail, 2½ pounds, $1: by express or freight, per pound 20c.; large lots, 15c.

Kansas Orange, for northern culture, prices same as Early Orange.

No orders filled for less than $1. Remit by draft money order or registered letter.

Caution must be taken in selecting Orange seed, as when cleaned, none but an expert can detect it from some other variety, and the desire to speculate may induce some to mislead by selling other seed as Orange. It was for this reason that I had placed this seed in reliable hands last season for cultivation, in order to secure reliably pure seed for my trade.

ISAAC A. HEDGES, 2004 Broadway, St. Louis, Mo.



Our Illustrated Catalogue contains all the most popular Plants and Bulbs in cultivation at low prices We also offer about 100 novelties for first time this Spring. Our collection of bulbous plants is finest in the country. Our Geraniums, Roses, Carnations, Iris &c. are unsurpassed. Estimates given for large quantities of plants and bulbs. V. H. Hallock, Son & Thorpe, Queens, N. Y.

FIVE FAMOUS OPERAS

MIGNON. ($3.) Opera By AMBROISE THOMAS This very successful opera first became known in Paris, where it slowly but surely worked its way to permanent distinction, and has become one of the standards. It is very full, occupies 405 pages, and furnishes to the purchaser quite a library of music of high order.

AIDA. ($3.) Grand Opera by VERDI. Composed in the first instance for the ruler of Egypt, and first given in that ancient kingdom, where also the scene of the story is laid. The strange life of old forgotten ages comes before us, and is made vivid by the thrilling music of one of the most brilliant of composers.

CARMEN. ($2.) By GEORGES BIZET. A Spanish Opera, introducing Spanish Gypsies, Soldiers, Spanish Dons, a Torreador, and Spanish Contraband Trailers. We are in contact with the *bizarre* ways and incidents of the Spanish Peninsula, and the music is quite in consonance with the prevailing brightness.

MEFISTOFELE. ($2.) By A. BOITO. Mefistofele is the true fiend, according to Goethe, whose poem is closely followed throughout. A daring composition, romantic and weird, and now widely given, and pronounced a success.

FATINITZA. ($2.) By F. VON SUPPE, whose music is most taking, and who introduces us, in a free and easy and humorous way, to Russians and Turks during the war. Very popular.

Any book mailed, post-free, for retail price.

OLIVER DITSON & CO., Boston.

Humorous.

A STUDY in oil: The attempt to get a sardine out whole.

"NEVER borrow trouble," said a husband to his wife. "Oh, let her borrow it if she can," exclaimed the next door neighbor; "she never returns anything, you know."

"Do you pretend to have as good judgment as I have?" exclaimed an enraged wife to her husband. "Well, no," he replied slowly, "our choice of partners for life shows that my judgment is not to be compared with yours."

"WHEN I goes a-shopping," said an old lady, "I allers ask for what I wants; and if they have it, and it is suitable, and I feel inclined to buy it, and it is cheap, and can't be got for less, I most allers takes it without clappering all day about it, as some people do."

Physicians Have Found Out

That a contaminating and foreign element in the blood, developed by indigestion, is the cause of rheumatism. This settles upon the sensitive subcutaneous covering of the muscles and ligaments of the joints, causing constant and shifting pain, and aggregating as a calcareous, chalky deposit which produces stiffness and distortion of the joints. No fact which experience has demonstrated in regard to Hostetter's Stomach Bitters has stronger evidence to support it than this, namely, that this medicine of comprehensive uses checks the formidable and atrocious disease, nor is it less positively established that it is preferable to the poisons often used to arrest it, since the medicine contains only salutary ingredients. It is also a signal remedy for malarial fevers, constipation, dyspepsia, kidney and bladder ailments, debility and other disorders. See that you get the genuine.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Vol. XL. No. 9. Whole No. 1622. | NEW YORK, FEB. 26, 1881. | Price Five Cents. $2.00 Per Year.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

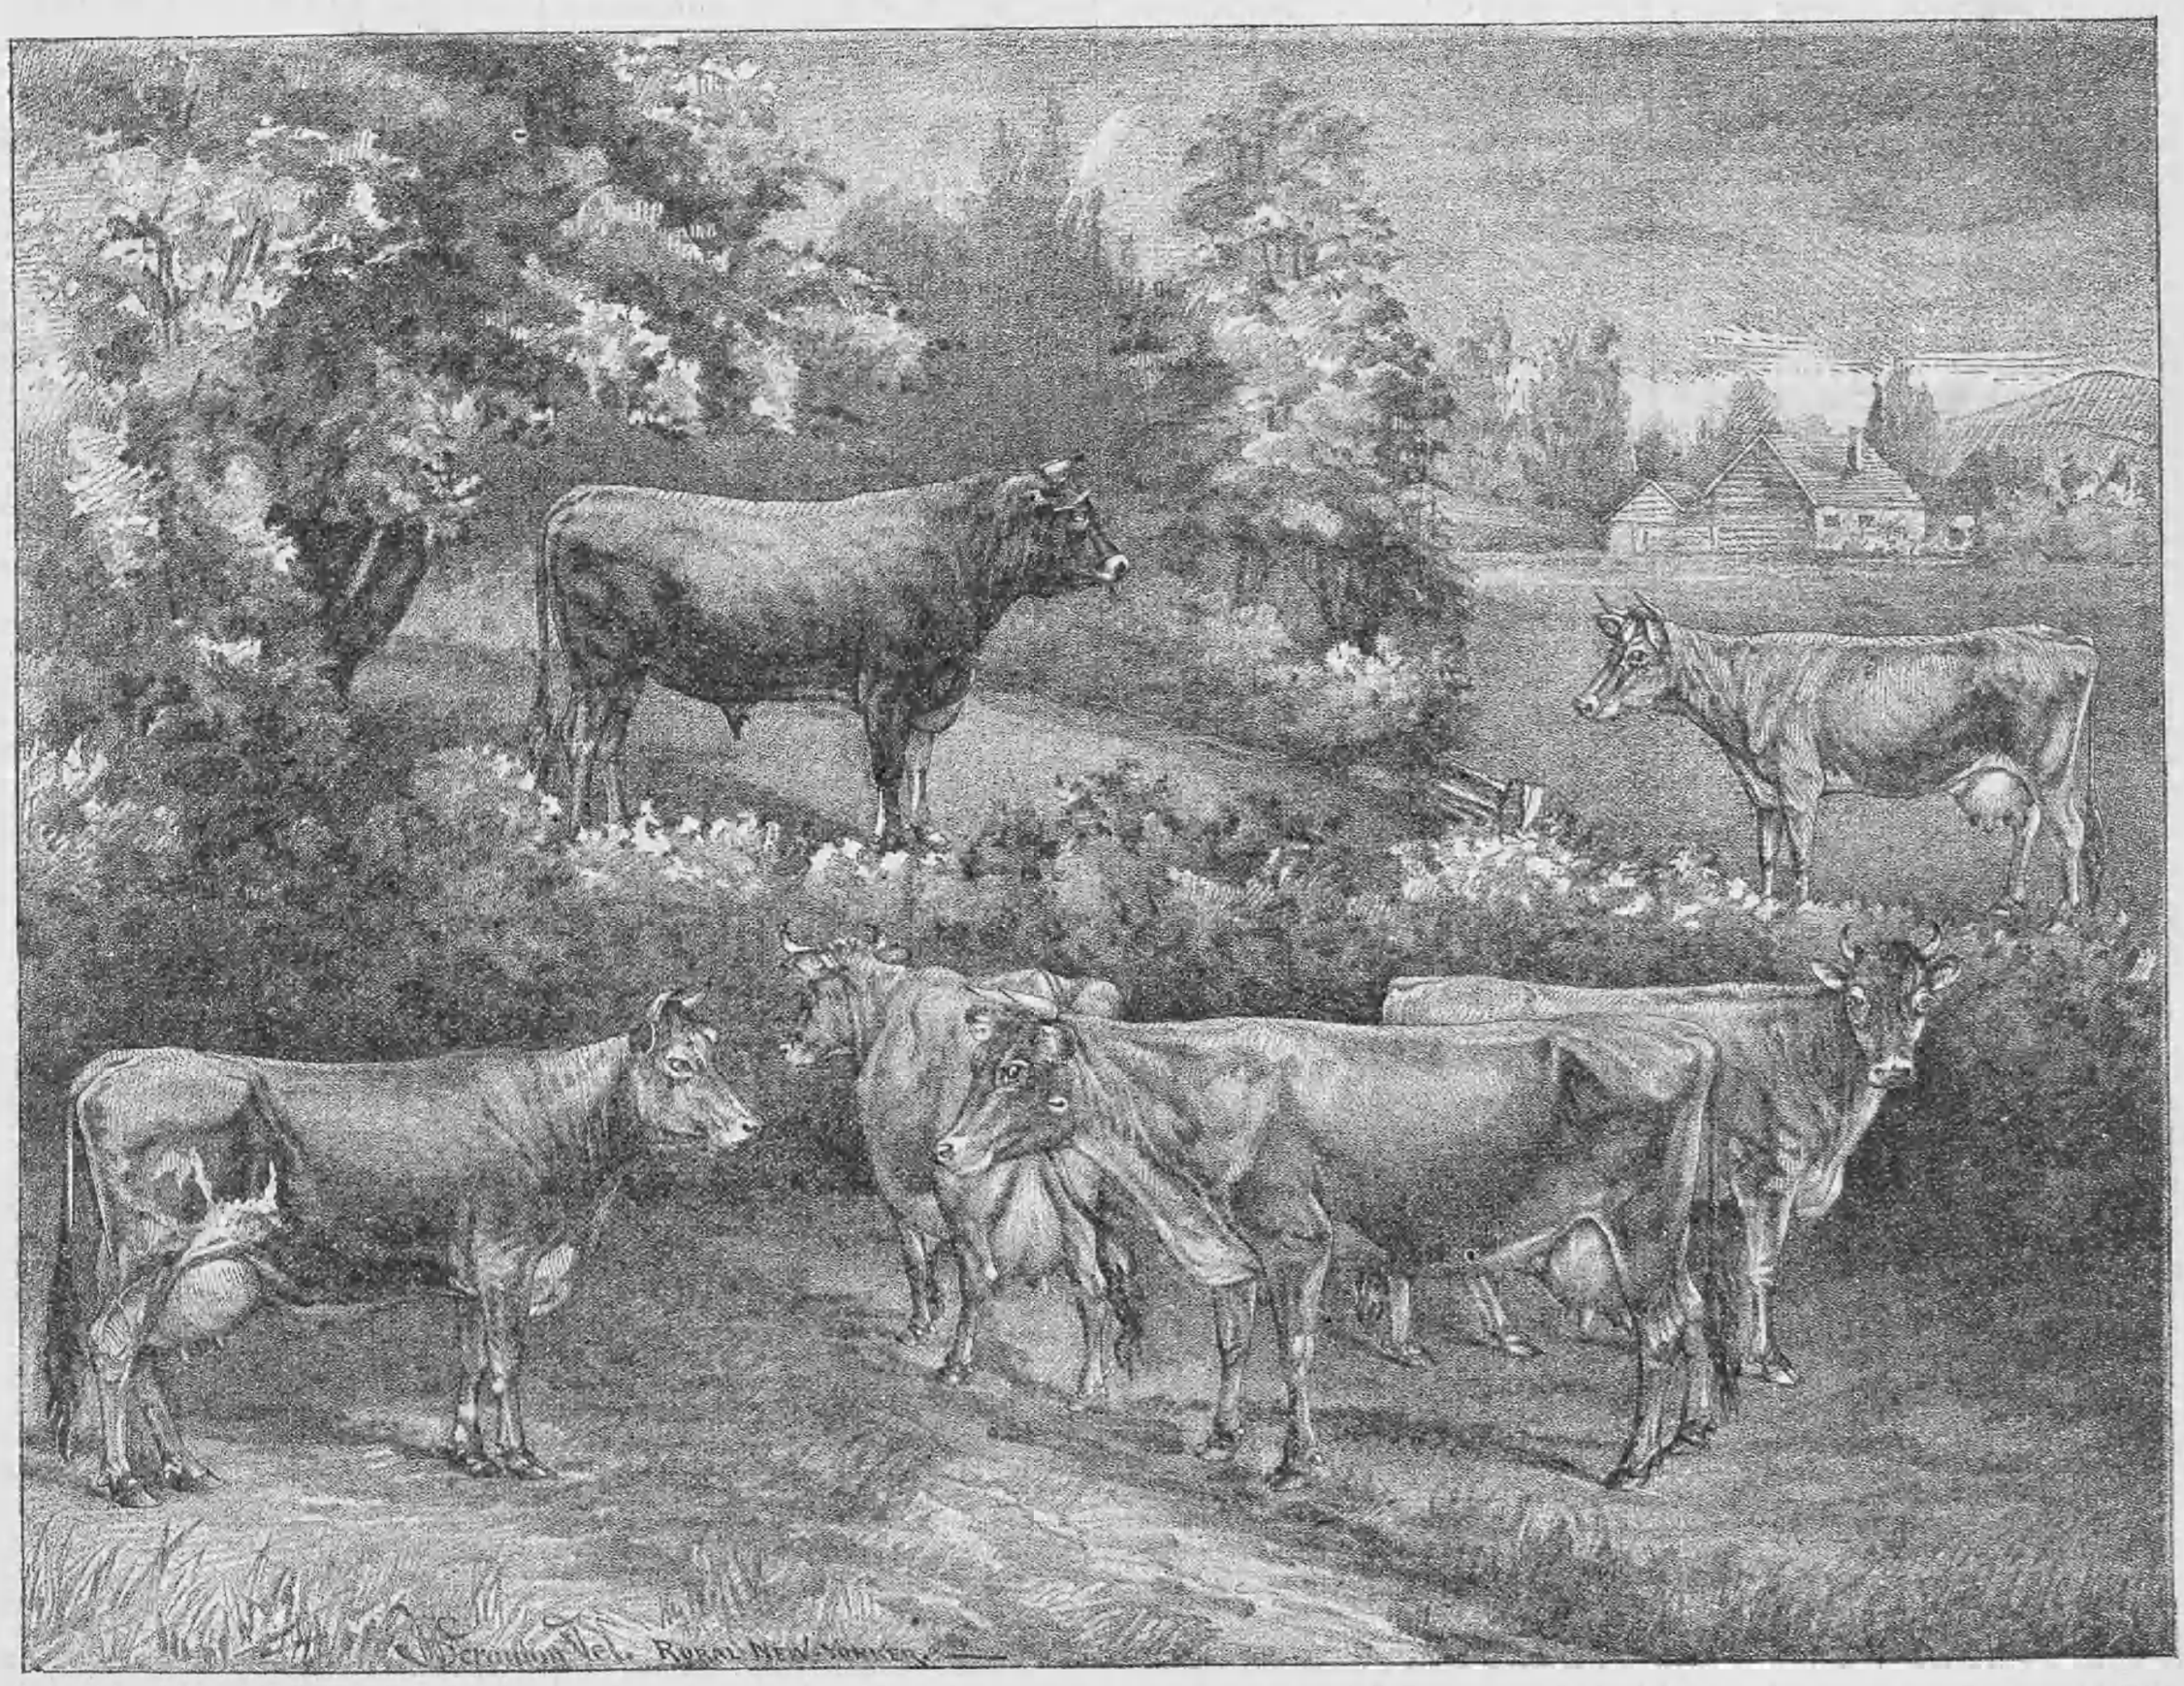
Ralph Evans

The Herdsman.

OUR ANIMAL PORTRAITS.

A Herd of Jersey Cattle.

We have much pleasure in presenting our readers with a fine picture of a group of Jersey cattle. All the animals represented, except the one on the left, belong to Mr. Simpson of Wray Park, Reigate, who had the group photographed. "Prince Albert Victor" occupies the elevated position; "Her Majesty" is in the background on the right; "Alice Gray" is next and faces front; "Luna" is in the foreground; "Jersey Lily" on her right, and "Young Panzy" occupies the extreme left.



A HERD OF JERSEY CATTLE.—Suggested to our Artist by a Colored Plate in Sheldon's Dairy Farming.—Fig. 106.

Doubtless all admirers of the famous Jerseys will take pleasure in examining our artist's faithful representation of their favorites.

JERSEY AND GUERNSEY COWS.—ABORTION.

In replying to a correspondent, page 71, about the quality of Holstein and Jersey milk, the writer says, "the milk of the latter usually yields a larger percentage of butter, and that of a better quality than the milk of any other breed." Does he forget the Guernsey, or is he not acquainted with its merits? I am informed by those who have kept both breeds for years side by side, and on the same food, that the Guernsey generally surpasses the average Jersey in richness of milk, and high color for butter, especially in the Winter. Single individuals equal each other often, but *the general average is in favor of the Guernsey*. She also possesses another advantage over the Jersey—when dried off, she fattens, more easily and rapidly, and makes a better quality of beef.

As to abortion, the writer does not state one thing which I have found vantageons in all kinds of domestic animals, and that is, not to permit the aborter to take, or even go near the male for at least three months, and it is sometimes better that the time should extend to six, nine, or even twelve months. After abortion the womb is in a feverish and unhealthy state for sometime, and totally unfit for a strong, healthy conception. By following the above rule, it has a chance to get well, and the female, kept back a proper time, never again aborted with me, but bred regularly a strong, healthy, thrifty offspring, as long as I wished her to keep breeding. B.

STOCK ITEMS.

Ponies in Great Britain.—We find a list of no less than six different breeds of ponies in England, varying in hight from the size of a good Newfoundland or St. Bernard dog, say 30 inches, (7½ hands) up to one of 58 inches 14½ hands. Anything above the latter we believe does not come under the head of Pony. The various breeds named are the Shetland, the Welsh, the New Forest, the Exmoor, the Dartmoor, and the Yorkshiremoor. These are all tough, serviceable animals, and quite as useful as the larger sorts of horses for various purposes.

The advantage of breeding ponies, which is done in large numbers in Great Britain, is, that they can be reared on waste lands of so poor a soil, that they are able to sustain little else. Moreover, the ponies are so hardy, they can usually shift for themselves without care, Winter as well as Summer. These ponies originally are generally rather coarse in their points, but good travelers and workers, and very enduring. The late Prince Albert, we have been told, was the means of considerably improving the ponies in some of the districts of the south of England, by sending down from his stables in London fine, compact, Arabian stallions to serve the mares.

In some of the Indian territories of America, as far north as Canada, down south to Florida and Texas, large herds of ponies are grown up wild. Those in Canada subsist in the Winter, chiefly like the deer and moose, on browse, moss and even to some extent, we are told, on lichen, when hard put to it for want of other sustenance, or to vary their fodder.

English Importation of Wool.—From foreign countries and its own colonies, the chief of which is Australia, England imported in 1878, 395,461,286 pounds of wool; 1879, 411,106,627 pounds of wool; 1880, 460.

337 412 pounds of wool. It has been supposed by some, owing to the great competition England now meets with on the Continent of Europe, in the manufacture of woolen goods, that this consumption of wool was diminishing with her; but the largely increased importation shown above in 1880, speaks to the contrary, just the same as it has for a few years past in the United States. This holds out great encouragement for us to augment our flocks as rapidly as possible, and the more so, as the consumption of mutton is constantly increasing with our people.

CALVES SUCKING EACH OTHER.—As this is an injurious practice, we shall be obliged if any readers of the RURAL can point out a preventive. By sucking the ears of each other, or the neck, or any parts of the body, they sometimes pull out hair and swallow it. This forms a ball in the stomach in process of time, and is very injurious to the calf occasionally causing death.

We have thought it possible by salting their milk or other food a little, that this might obviate the desire of sucking, the same as it does that of poultry picking at the combs and heads of each other. There is a natural craving of all animals for salt, and it ought to be gratified without injuring them.

SALE OF AMERICAN HORSES IN ENGLAND.—Thirty horses were sent over last December, and having a very rough voyage, arrived in England in bad condition. They were sold at Tattersall's auction, January 13, and brought an average of £73 17s. (about $355) each. The highest price was 165 guineas—(say $1,776). We cannot say whether these figures obtained resulted in a profit or loss to the American consigner; but this we know, if he wishes to have future horses cross the Atlantic with any kind of comfort and safety, and arrive at their port of destination in good condition, let him ship them in milder and pleasanter months, say from April to October—neither earlier nor later. Sling and pad horses in their stalls in the best possible manner, still, in rough weather, they suffer badly, as they can neither be well-fed, nor especially well-watered, so essential is the latter to them; and moreover, the rolling and pitching of the ship, and the unusual noise and clatter on board frightens and seriously affects their nervous sensibility.

GOATS' HAIR IMPORTED INTO ENGLAND.—It is only a few years since this article began to be imported to any appreciable extent. It amounted in 1830 to £1,196,909, (say about $5,750,000). No wonder the people of England wish to encourage the breeding of goats of an improved kind, when they have such a valuable home market for their fleeces: to say nothing of a still greater value of their milk, when bred also for a superior quality and quantity of this, as well as for the hair. Goats can be kept and thrive on the poorest kind of land, and the most humble cottager can keep them as well as the wealthiest farmer,—that is, in numbers according to his means.

A. A.

Dairy Husbandry.

THE DAIRY COW—NO. 26.

HENRY STEWART.

Cheese Making.

CHEESE making depends upon the existence in milk of a peculiar substance known as casein. This substance may be procured in a pure state by the following process. A certain quantity of milk is deprived of the cream in the usual manner and then coagulated by the addition of a small quantity of vinegar or dilute acid and moderate heating. The milk will form a stiff, jelly-like substance which consists of the casein intimately mingled with the whey. In course of a short time these separate, when the whey may be poured off and the curd left. If this be washed and kneaded with pure water, repeatedly poured off and renewed, the casein may be procured nearly pure. For its perfect purification it may be dissolved in a weak solution of carbonate of soda and left to stand for 12 hours when any cream that may arise may be poured off. The casein may then be precipitated by the addition of vinegar and washed and boiled in pure water. By repetition of this process it may be procured free from fat and the milk salts. When thus prepared it is acid, as may be shown by its reddening of litmus paper or any vegetable blues. It is only slightly soluble in water; one pound requiring 400 pounds for its solution of carbonate of soda or potash. These solutions may be coagulated by the addition of an acid which neutralizes the alkali and the curd may be again thrown down by heat; if, however, the acid be used in large quantities the casein will be redissolved.

This curious behavior is of great interest and of very wide pertinence to the dairyman, and its application may be made valuable in a great variety of emergencies that are always occurring to dairymen. For instance, from a knowledge of this behavior under the circumstances mentioned, may be indicated the action of an acid condition of the blood in causing the coagulation of the milk in the udder and milk ducts and the nature of the remedy to be applied, viz.: the use of solution of carbonate of soda injected into the udder to dissolve the curded milk or the use of alkaline salts medicinally as an alterative for the condition of the blood. Also it explains some of those mysterious troubles which are always happening in dairies that are not skillfully managed and those accidents which may happen even in the best regulated dairies. Common sense and a little consideration will help to apply the knowledge of the character of this important constituent of milk to the remedy of many of the troubles of the dairyman which are too numerous to mention here, but which will be taken up as they may occur. Milk caseine is identical in composition with the fibrin of wheat; the legumine of the bean and pea and the albumen of egg or vegetable substances. It is declared by some chemists that they are convertible into each other in the animal system. It is known that they are physiologically isomeric, that is, they contain the same elements in the same atomic proportions although the ultimate combined atom or molecule may differ in each substance. The chemical composition is as follows: in 100 parts there are carbon 53 5; hydrogen 7; oxygen 22; sulphur 1 6; phosphorus 0 4 and nitrogen 15 5.

The acid used in curdling milk may be of any kind; muriatic or hydro-chlorie or chloro-hydric as it is variously called, is used in the making of Edam and Gouda cheese in Holland; in other countries common vinegar, tartaric acid, lemon juice (citric acid) cream of tartar and salt of sorrel (oxalic acid) are occasionally used and in the renowned "Schabzieger" cheese of Switzerland, lactic acid, and caseine itself, in the shape of sour milk are used for procuring coagulation. The action of heat operates on the curd by causing it to shrink and become solid, and so expresses the whey from among the particles, and not only hastens the action of the acid in causing coagulation, but also the separation of the curd from the whey. The heat should be gentle, else the curd is so much solidified and toughened as to become unfit for the manufacture of cheese; indeed by the use of excessive heat, curd of milk has been made the basis of an artificial ivory and with a mixture of some other substances may be made of great hardness and elasticity. The agent generally used for procuring coagulation is rennet. Although this is a well-known substance yet it is very little understood and deserves some special consideration which however must be left for another article.

The Swine-Herd.

BREEDING SOWS.

COL. F. D. CURTIS.

MUCH loss often occurs with breeding sows. This is generally the result of bad management. Sows are kept in small pens during the Winter when they cannot obtain any exercise, which has a tendency to make the young pigs weak and feeble at birth. It is natural for pigs to root and work for food. When confined in cramped quarters with plenty of food they get too fat which inclines them to stir about but little. They should always have a roomy pen or, what is better, two apartments, one for a bed and the other for a feeding room. This will make it necessary for them to move about more and will also aid in keeping them clean.

Too little attention is often paid to their cleanliness. A dirty hog besides being disgusting to look at cannot possibly be healthy. A coat of filth on the body shuts up the pores and the orifices on the inside of the legs, through which, it is said, a pig perspires, and which should never be closed, as they are apt to be when a pig is compelled to wallow and lie in a dirty pen. Filth is liable to make the udders and especially the nipples sore. When this is the case the mother will not allow the young pigs to suck and is often made ferocious by their attempts to the extent that she will turn upon them and destroy them, as she imagines that they are the cause of her pain, whereas, the primary cause arises from the fact of neglect on the part of her owner. This trouble, which is quite common, may be known by the sow jumping up as soon as the pigs begin to suck. She often treads upon the young ones, when thus excited and injures them in this way. It is an excellent and safe plan to examine the udders and nipples before the birth of the pigs and wash them with soapsuds and grease them if they are found inflamed or cracked. If a hog gets dirty it should be washed, and, if the skin is scabby, it should be smeared with kerosene oil and lard mixed and well rubbed on. We know of nothing so good to cleanse and heal the skin as this.

After a clean, roomy pen is provided the next important consideration is the food. Fatal mistakes are made in this respect. Stimulating and heating food should be given if at all in small quantities especially when the mother approaches the period of parturition. The bowels should never be allowed to become constipated which may be discovered by the hard and dry condition of the excrement. If the young are born when the sow is in this condition which is productive of fever and inflammation, she will very likely be an unnatural mother and destroy her young. The remedy lies in preventives. When proper precautions are taken in their food, trouble, of this kind which is very common, may be avoided. Vegetable food is the healthiest and safest. We have always had the best success with pigs when nothing but this kind of food was given to the mothers. If roots are not to be had then we should recommend wheat bran or shorts as preferable to any other feeding of grain. The most objectionable of all is corn or corn meal.

Breeding sows are generally kept too fat. They will not bear when in this condition either so large or healthy pigs, and they are also more liable to a wrong presentation which is alike dangerous to both mother and young. A breeding sow should never be fed so liberally that she will attain her full growth. This is a condition for a porker and not for a breeding animal. A condition of half fat or thrift is the right one. There is a large loss in making unnecessary growth with breeding sows in food which is thus wasted and in causing the sow to be too large and unwieldy which makes her more liable to lie upon her pigs and crush them. Such sows will be slow to move whereas, if they were lighter and consequently more active, they would get up quicker when they heard the cry of a little one.

Sows should be fed lightly for a few days after the pigs are born or else there may be a surfeit of milk which will cause the pigs to scour, taking more than they can digest and also causing caking of the udders and fever which will check the flow of milk and make it dry up. We have known instances of such excessive swelling of the udder, or caking by so much feed that the milk would not flow at all. When this is the case they should be thoroughly bathed with water, or vinegar, which is better, as hot as it can be applied. Thorough rubbing is also beneficial. Sometimes the mother's milk will not flow for a number of hours after the pigs are born. This condition may be known by the pigs appearing hungry and unsatisfied and not lying quietly in the nest after suckling. It can be easily made certain by squeezing the udder.

When the milk does not flow the pigs should be fed cows' milk from a spoon. When this is done they should be taken from the nest and then quietly returned to the mother. They will require at least a half dozen teaspoonfuls of milk at a time and should be fed every three or four hours. The effort of the pigs at suckling will help to cause the milk to come. Whenever a nipple is found to be cracked or sore the pigs may be kept away from it by smearing it frequently with coal tar, but, if the trouble continues, it is better to cut the nipple off rather than jeopardise the whole litter. We have done both successfully.

Before the birth of the pigs care should be had to have a small bed or at least one in which the young pigs will not get entangled. A feeder of plank should be constructed on the sides of the pen about ten inches above the floor against which the back of the sow may rest and under which the pigs may be protected as this will prevent the mother from crushing them.

When a sow is kept in a close pen and does not have access to the ground or grass it is an excellent plan to give her frequently cinders of coal ashes, which she will eat greedily, charcoal, sulphur and salt which all help to promote digestion and keep her stomach in healthy condition. Warm drinks should be given for twenty-four hours after parturition.

A breeding sow should be made tame when young so that she may be handled. Sows will breed well for a number of years and old ones are much preferable to young ones as the pigs will be larger and grow faster. It will pay to take considerable trouble to make them docile.

Field Crops.

THOROUGHBRED CORN.—No. 2.

B. F. JOHNSON.

WHAT weight are we to allow to the thoroughbred idea in the case of seed corn, and the claimed prepotency and fertility of some varieties over others. If a given variety of seed corn is grown separate and so far apart from all others that there can be no fertilization from abroad, I am ready to admit that like will produce its like more nearly than where the common and average circumstances of corn growing prevail. But I fail to see why the most prepotent seed will not be cross-fertilized from abroad, where corn is the dominant crop of the country, and where it is quite impossible to prevent the transfer of pollen from one field to another, by winds, by birds, by insects and in many other ways and means of communication. And in the matter of fertility of a given variety, is there one which will produce an ear on each stalk, when they stand as close as they do, in case of having been broadcasted for a forage crop? It is probable indeed, that a variety of corn, which had been grown on a dry, a thin, or an arid soil, might in a long course of years, develop a large and strongly absorptive, or feeding radicle system, and that when transferred to richer soils, it would ear better than these kinds, natives and to the manor born, but still the fact remains to be proved. And then, in opposition to this assumption, we have the fact that when corn, the product of the poor and worn soils of the east, is taken to the richer soils of the west, the yield is lessened in almost every case.

I am strongly of the opinion that the barren or non-fertile stalks one meets with in the average corn field, and they are seldom barren as to the production of pollen, is due to too thick seeding or perhaps to the lack of the right kind of food in the soil to perfect development. In no variety of corn common to the country, have I ever found barren stalks, except those I thought to have been made so by over seeding or by asking of the soil to produce more grain than there was plant food in it to make grain out of. In fact the over seeding of the corn crop is a common vice of the country. We plant three or four kernels in the hill where we should put but two, and we crowd both the rows and the hills altogether too much, and in doing so, get from 10 to 25 per cent. barren stalks where we ought to have none and the ears on the fruitful stalks are lessened accordingly. On this point I find many thoughtful farmers to agree with me among whom I quote Mr. E. S. Lawrence, late head-farmer of the Illinois Industrial University, whose opinion is to be found in the Report of that Institution for the year 1879.

But there is something very curious in the fact, that given two soils of equal productive capacity, so far as we can judge, the one, say under latitude 42 deg., the other 36 or 37 deg.—the distance apart in the seeding, must be widely different, in order to procure a full crop from both.

If the best average under latitude 42 deg. requires that corn shall be planted three feet each way, with three or four kernels in the hill in order to produce the largest crop, under latitude 37 deg., the distance must be increased to four feet with two stalks in the hill, or the plants will refuse to ear, and this, too, on such rich soils as the Mississippi River bottoms above Cairo and below latitude 37 deg. As we go farther south, and the soil gets thinner, the seeding is reduced to one stalk in the hill, and the distance ranges in the hill, from three feet to four.

These things are very clearly seen on the trip from Chicago in latitude 42 deg., to Cairo, in latitude 37 deg., and further demonstrated as one moves along a north and south line to New Orleans, something near latitude 29 deg.

In the case of the corn crop, it seems natural and reasonable to think, that the richer the soil and the warmer the climate, the nearer the plants should stand together, in order to get the greatest yields; but practice and experience teaches us just the contrary in this, as in many other things. And in this may be the explanation of the many failures complained of in the Cuzco Corn, widely disseminated last year. It grew in every case when planted, but in many, refused to ear because it was crowded together like the common corn of the north; whereas, being a tropical variety, it was used to be planted, a single stalk in a hill four or five feet apart and on a soil which is nothing if it is not of the richest, in every element of plant food. If the Cuzco Corn had been treated to a bushel of half fresh wood ashes and half old stable manure to the hill of a single kernel when planting, and thereafter each stalk made to stand four or five feet apart, the result would have been different indeed.

What answer then have we to make to the question, "What weight are we to attach to the thoroughbred idea in the case of seed corn, and the claimed prepotency and fertility of some varieties over others?" First, that no variety is so thoroughbred that it will not cross with others, which dominate the country, and finally absorb and perhaps obliterate them—and, second, no variety is so fertile as to be able to overcome close planting and fertility of the soil, and, thirdly, probably the whole matter of fertility, depends on just the right measure of, and neither too thick nor too thin, seeding.

TOBACCO CULTURE IN CHEMUNG CO. N. Y.—No 1.

Its History up to the Present Time.

AMONG the tobacco-growing sections of the north, famous for producing superior cigar-

making or seed-leaf tobacco, is the place known commonly as the "Big Flats" district, but more appropriately called the Chemung; for it is in Chemung Co., along the valley of the Chemung River that the bulk of the tobacco called "Big Flats" is grown. Twenty years have passed since tobacco was first grown to any extent as a farm crop in this county. Previous to 1856 tobacco growing here was but an experiment. Our farmers were ignorant of the correct modes of cultivating and handling the plant and the product was sold at so low a figure as hardly to repay the cost. But these experiments were sufficient to demonstrate the fact that the soil was capable of producing a superior quality of leaf, of great value to the tobacco trade. At the breaking out of the war, which so interfered with tobacco production in the south, farmers found greater profits in the crop, which increased until it was declared that tobacco growing was decidedly remunerative.

But the majority of our farmers hesitated for a time to engage in a business, which required a considerable outlay of capital, in the shape of buildings, etc. Some argued that the war would soon close and tobacco would cease to bring profitable returns; while others said it would ruin the soil if the production was continued. As time advanced, however, and the war got under full headway, prices were offered for our tobacco that seemed fabulous. It was found that a single acre of tobacco properly managed, would yield an income, sufficient to purchase two or three acres of good farm land. This fact was sufficient to overcome the prejudices of the majority of farmers and the business of tobacco growing became a rage. Up and down the rich valley of Chemung and the narrow valleys of its affluent streams, tobacco sheds were erected and our valley was dotted with tobacco fields. The production continued until the Summer of '64 which season was decidedly unfavorable for tobacco growers. A severe drought occurred in the Spring, during "setting" season, which made it extremely difficult for growers to start their plants in the field. Those who succeeded with great perseverence, in starting their plants, met with other disasters. Grasshoppers were very numerous during the summer, which damaged the crop very seriously. During the month of March of the following year, while the crop was yet in the sheds, our whole valley was inundated with water from the overflowing river, caused by the melting of a vast quantity of snow in company with a heavy rain storm. This flood did great damage to the tobacco lying in sheds which were mostly situated in the low lands of the valley.

These disasters, in company with a sudden falling off in the prices of the product, dampened the enthusiasm of tobacco growers, and as the result the acreage devoted to the crop decreased greatly. But in a few years prices again ruled high, and growers sometimes realized as high as thirty cents a pound for their entire crops. The acreage again increased to its previous extent and tobacco growing again became a rage. Stable manure was eagerly sought after and farmers frequently paid $3 cash per load for it. Since 1870 prices have ruled lower, having ranged all the way from seven to twenty cents per pound. Labor has also been more plentiful and cheap, and our growers have found profit in tobacco growing at 10 cents per pound.

The crop grown the past season in this tobacco growing district is undoubtedly the largest ever produced here. It has been estimated at not less than 11,000 cases or about 4,400,000 pounds. It has already been entirely bought up by New York packers mainly. The prices paid have ranged from 10 to 14 cents per pound according to quality. Our growers now look upon the tobacco growing business as a permanent industry. They do not expect to grow rich from it, yet they find more profit in it than from ordinary grain growing, and with our small farms of high priced land, it enables us to expend a vast amount of labor at a fair profit. In other words, tobacco with our farmers, is a crop well calculated for fertile, high priced land. I propose in the following articles to give in brief, what I have learned from experience and observation, of tobacco culture in Chemung County. The methods of culture and of handling the plant, differ somewhat from those followed by growers in other tobacco growing districts. The methods which I shall describe are those most popular here.

THE CULTURE OF PEANUTS AT THE NORTH.

ALMOST every one is aware that peanuts as a profitable farm crop can only be successfully grown in the Southern or border States, and in a sandy, light-colored soil, where the shells will be of a bright light color and free from dirt. But it does not seem to be generally known that they may be grown on a small scale as a garden crop for family use in favorable soils and situations in many parts of the North or at least as far as latitude 42°, and at the West where there is much hot Summer sunshine probably still farther, and that almost as easily and surely as potatoes. [We have grown them and seen them grown on Long Island farms repeatedly. Eds.] The yield of riper nuts will here be light compared to that in their favorite latitude and in our dark, adhesive soils the shells will present a dusky, dirty appearance; but the flavor is the same, and the yield I think sufficient to warrant their culture by those who have the time and taste to cultivate a variety of garden products. A rich sandy, or at least mellow, loam in a dry warm situation, should be selected. They endure heat and drought well. The soil should be loose and mellow, and if not rich, should receive a dressing of fine, well rotted horse manure. Plant the latter part of May in drills three and a half feet apart and two inches deep. Take the kernels out of the shells, but do not break the thin, red skin surrounding the meat. Plant the kernels a foot apart in the drills and cover with fine earth. [By experiment we found it was better to plant the entire fruit, that is, shell and all. Eds.] Keep the ground mellow and absolutely free from weeds, and when the vines begin to blossom sprinkle a little fine earth over them to hasten the rooting process. As the nuts grow on the roots which strike down under the blossoms, the earlier and more freely the vines take root, the greater the yield of ripe nuts maturing before frost. [Our friend is a little mistaken here, we think. They are not roots at all. If the blossoms (ovules) are fertilized, what seems to be a growth of the receptacle or head of the flower stalk, takes place, carrying the ovary downward which makes its way into the ground and at once begins to enlarge, forming the peanuts.—EDS.] After frosts have killed the vines pull them up and pick off the nuts, those well developed, that have the rough, wrinkled shells which indicate ripeness, spread in a warm, dry place under cover and stir frequently till dry, when they may be roasted as wanted. The children will attend to the roasting, but may need some instruction as some experience is required to get them baked just right. They may be spread in a dripping-pan, and roasted in the oven like coffee, stirring often to prevent burning.

"G."

THE PROGRESS OF VEGETABLE LIFE.

A SINGLE potato plant is probably as good an exponent of most vegetable growth, as it is well known to observing agriculturists. The dormant seed (the eye from a healthy tuber) is planted, say, in April, and almost at once the combined influence of darkness, moisture and warmth causes the bud to grow. The effort to reach the light, and to propagate its species, seems to be as strong in the vegetable world as in the animal, and the result is, the foliage, of full green, shoots above ground, while the young roots go below to forage for the general good of the whole plant and to escape the impending heat of the advancing season.

The ever-spreading roots below feed the foliage above, and the "top" soon shields the roots from the sun's direct rays—a measure of mutual benefit, as neither could go to maturity under reversed conditions. The season passes, and as the roots and tubers mature, the top assumes compactness, strength and that *tone of green which is the coolest*, thus again, by another means, providing for the healthy progress of the newly-formed seed.

At last, when the tubers are mature, they announce to the foliage that their office is completed, and the gradual change to yellow, brown and black withered stems and dried up leaves is the acknowledgement of the final change, which overtakes all plants in the due course of nature.

It requires but a slight study of the condition of these plants during a season's growth to discover what the cultivator must do to assist in making a remunerative crop.

Dodge Co., Neb. S. RUFUS MASON.

REPORT

On the Golden Ovoid Mangel Seed Imported and Distributed by the Rural New-Yorker in the Free Distribution of 1879.

OWING to the fact that the mangel reports received from many of our subscribers to whom seed was sent last year in our Free Seed and Plant Distribution, have been mislaid, we are not able to present as full a statement as we would be pleased to have done. Fortunately we can give the names of those whose best three mangels weighed over 30 pounds, but we shall be obliged to ask those persons named in the following list to send us their full address.

Here are the names, and opposite are given the weights of the three heaviest mangels:

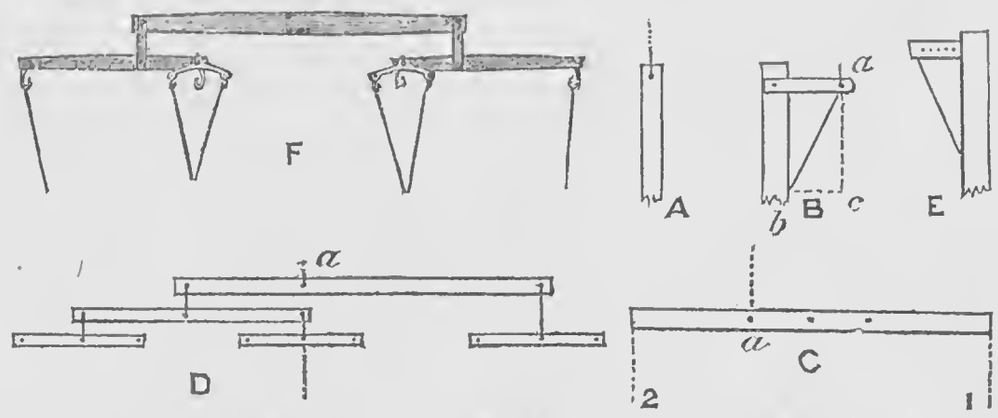
NAMES OF MANGEL CULTIVATORS.	Weights of best three.
E. Farnham	46½ pounds.
G. E. Warner	45¼ pounds.
Edwin Keeler	43 pounds.
Jasper Barnes	39¾ pounds.
T. Leete	39 pounds.
H. Patrick	38⅝ pounds.
W. L. Day	34 1-16 pounds.
W. Moore	33½ pounds.
J. L. Scott	33 pounds.
L. Singer	33 pounds.
H. R. Roberts	32 7-16 pounds.
E. P. Moon	31 11-16 pounds.
N. L. Webb	31 3-16 pounds.
W. H. Harter	31 pounds.
James Grace	30 6-16 pounds.

Farm Economy.

THREE HORSES ABREAST.

(See page 135 for query.)

THE great convenience of using three horses abreast in plowing heavy land makes it desirable to find some way, if possible, to employ the three horses without at the same time losing some of the extra power or of meeting with some obstruction or inconvenience which may greatly reduce, or even destroy, the gain. There have been very many contrivances devised for employing three horses, and by some combinations of levers it has been thought that all the difficulties have been overcome. But, in fact, there are no combinations of mechanical devices which are able to get around the simple but inevitable laws which control the application of power to move weights or exert forces. When one understands these laws, it becomes clear why many ingenious devices for the use of power or force in peculiar methods have failed. One primary law of mechanics is that the force of draft or impulse is always directed in a straight line when the force is simple or single. Another is that when two equal forces operate in different directions, not directly opposite to each other, the direction of the motion produced is precisely between the lines of the two forces; when equal forces are acting in exactly opposite directions, one neutralizes the other, and there is no motion at all.



ARRANGEMENTS FOR USING THREE HORSES ABREAST.—FIG. 107.

To apply these principles to the draft of a plow we may consider that when one horse is hitched to a plow he will draw it in a straight line; that if two horses are hitched by means of a double-tree attached to the plow by its center, the draft will also be in a straight line. If, however, the point of attachment is not in a direct line with the middle of the plow beam, the draft will not be in a straight line with the beam. This is shown in the following diagram, fig. 107. At A, the draft is from the center of the beam and the force is exerted in a straight line, as shown by the dots; at B, the draft is from the end of a rod fastened to the plow beam at *b*, and the point of attachment is at a distance from the end of the plow beam and on one side, at *a*. When the plow is started, the point *b* is at once swung around to *c*, so as to bring the line of draft in the same direction as that of the moving power. This cannot be avoided. If a man holding the plow keeps it in the furrow, he must exert a certain force or power, which then becomes directly opposite to that which moves the plow, and this exertion exactly neutralizes a corresponding amount of the horses' exertion and destroys it. This, too, cannot be avoided. Therefore, in drawing a plow by any combination of whiffletrees or other levers, the point of draft must be in the line of the middle of the plow beam, otherwise the plow will be swung around or must be held in the furrow by the exercise of sufficient force to resist the side draft.

When we come, then, to consider how three horses abreast may be used in plowing so as to have one horse walk in the furrow, or nearly on a line with the plow beam and the width of the furrow slice only out of that line, and that each horse may do one-third of the work, we find that it is impossible, unless some of the force of the horses is lost, being neutralized by the exertion of the plowman to resist the tendency to swing the plow around, and much extra and severe labor is thrown upon the man.

In hitching three horses to a plow or a wagon the principle of the balance or scale is brought into action. In the diagram, at G, a doubletree 4½ feet long is represented, having a hole in the middle and one at each third of its length. If this were used for a balance and suspended by the hole *a*, two pounds at the end of the short arm would be balanced by one pound at the end of the long arm. This is well known, but its application to the use of whiffletrees is not so well known, for a person not long ago applied for a patent on a combination of levers to do away with this natural law, which would be equivalent in its effect to making one equal to two, or twice one equal to one instead of two; and, for a wonder, his patent was not granted, but it was on the grounds that the device was not novel. Unfortunately it is not novel, for many persons have spent time and money in trying to make out the same improvement on the multiplication table.

Therefore, as there is no getting over an impossibility, one must either have the third horse walk a little outside the furrow on the plowed land, or he must plow a wide furrow, say 16 or 18 inches, or he must attach a horizontal draft plate to the end of the plow, so as to throw the draft as little as possible on to the land side, to enable the off horse to walk in the furrow, and exert the muscles of his arms and shoulders to keep the plow straight. The common three-horse evener is made 4½ feet long, and the hitching point is 1½ foot from one end (*a*, fig. D). The common doubletree is used at the short end, as shown. This brings the line of draft exactly on the plow beam. By making the evener and double and singletrees as short as possible, the outside horses are brought nearer to the middle horse. With small horses an evener of three feet may be used, in which case the equalizing side draft plate may be used, and the few inches gained with this, with the plowing of a wide furrow, will enable one to use the three horses without much inconvenience in the way of overcoming the side draft by muscular exertion of the plowman or loss of horse power, and still have the off horse walk in the furrow. A very good arrangement for three horses is shown at fig. F. The equalizing plates, or singletrees, are made quite short; very short wooden ones of the common kind will answer every purpose. The inside traces are crossed so that the middle horse pulls precisely the same as the outer ones.

Dogs.

I agree with J. S. Woodward (RURAL page 35) that something should be done to abate the "dog nuisance." Cannot our Legislature give us a law that will afford some relief to farmers? In November last, two worthless curs got into my hen-house and killed thirty Plymouth Rocks, in about as many minutes, besides frightening the balance of my hens so as entirely to stop their laying for weeks. I was fortunate enough to kill one of the dogs, the other escaped. Several of my neighbors have lately had their poultry killed by dogs. Now have we no means of redress? In a trial held in this county this Winter, it was decided that a man had no right to shoot a dog caught killing sheep, but that he might recover damage of the owner. Now it is oftentimes difficult to prove the ownership; besides, about nine dogs out of every ten belong to persons who possess no property. What is the good of a judgment against a majority of the dog owners?

We have a law taxing dogs, but what does it amount to? It is, and I suppose can only be, partially enforced and therefore it is almost useless. Several years ago the assessors found only three dogs in one ward in Syracuse, while there were actually sixteen within one block of my residence. We need a law that compels a person to procure a *license* to keep a dog, said dog to wear a collar plainly marked with its owners name, and with the number to correspond with the number of the license. All dogs not so licensed, and provided with a proper collar, should be promptly killed. Any person should be allowed to destroy them, and if necessary a reward of fifty cents per head should be offered. Personally I feel interested in this subject, and for reasons stated. NELSON RITTER.

Industrial Topics.

SORGHUM SUGAR AND SIRUP MAKING.

I. A. HEDGES.

THE frequent inquiries that reach me from subscribers to the RURAL NEW-YORKER induce me to discuss the sugar and sirup business from sorghum canes, in a practical and business manner, not so much, however, in the line of culture as that of manufacture, as the former is, or may be, summed up by saying, cultivate as for corn, either in hills or drills, and commence to cut and work as soon as the seed is fairly ripe. The experiences, as expressed at our late annual cane-growers meeting, favored allowing the cane to rest either in gavels or shocks about two days, to allow the leaves and husk of the stock to cure before hauling and heaping or even working it up. It is now generally considered better to work the cane with the leaves attached, as the labor of

stripping costs more than the loss of juice with the leaves. Then, inasmuch as the best disposition to be made of the bagasse is to use it for fuel under the boilers, the leaves will assist to increase the fire. It would be difficult to give directions for constructing such furnaces in a communication like this. The tendency at this time among those in the business is to the central factory system, the same as in cheese making, and I must say it is the only feasible plan, especially in the Northern States, where farms are small and devoted to varied crops. Recourse to this plan is made more necessary by the great deficiency of well skilled operatives as boilers; however small the works, the making of sugar is liable to be a failure without a competent boiler, and, however large the work may be, one skillful boiler may be sufficient.

Now to afford readers of the RURAL an idea of the plan that is being adopted in some of our prairie districts, I will quote one in Rice County, Kansas, a thriving town of 1,000 inhabitants, closely surrounded by a rich soil where cane has never failed. An association has there been formed of citizens and farmers, and all the facilities are offered by the corporation that it can consistently afford. Farmers sign agreements to grow cane to the required amount—say 500 acres—cultivate and handle it as required, and deliver it at the mill, leaves and seed attached, at the rate of $2 per ton or 2 000 pounds This constitutes the agricultural department of the enterprise and should be distinct from the manufacturing. This latter they are not so well prepared to organize, as cash capital is lacking, but it is thought Eastern capitalists may find a safe and paying investment for a few thousand dollars by joining these earnest workers and by employing the three or four months of the most pleasant part of the year in taking off these crops.

I will give a brief outline of the operations, presenting what is, as appears to me, a safe and reliable basis of calculation. We suppose the works to cost $10 000 all complete, capable of making 500 gallons of sirup weighing 12 pounds each in 12 hours' run, working up 42 tons of cane, costing $44. The requirements will be as follows: 12 hands at $1 per day and three more at $2 each; cost of fuel, over and above the bagasse, $2 per day; incidental expenses and interest, $3 per day, making a total of $65 daily for expenses. The income will consist of 500 gallons of sirup at 30 cents per gallon, or $150, or $140 exclusive of casks. The seed yield will equal one bushel per ton of cane, which, when fed with the skimmings and wash of tanks, boilers, etc., will considerably exceed in value one bushel of corn in fattening hogs or cattle. It is fair to estimate the pork produce from this at 12 pounds per bushel, or $500 pounds per day from the 42 bushels, worth, at three cents per pound, $15 per day. The result will therefore foot up as follows:

Total daily receipts	$155 00
Total daily expenses	65 00
Total daily net profit	$90 00

If there are 500 acres each returning 10 tons of cane and each ton yields 12 gallons of sirup, which is a low estimate—it will take 120 days' time to take off the crop.

This, however, is longer than the seasons will generally admit. Working may be begun in the latitude of Missouri and Kansas by September 1st, and continue with very little interruption until December 1st. To expedite with the apparatus of the size indicated, therefore, running the works at night is the legitimate recourse. This, in fact, is the economical plan just as soon as a sufficiently skilled force of hands is drilled to the work. Now, if the works are made still more complete by the addition of a vacuum pan, and a fair proportion of sugar is obtained, a much larger net balance will appear, as it is not difficult to swing four to five pounds of sugar, worth eight cents in Kansas, or Missouri, and still have as good a sirup as that not susceptible of granulation; for it must be understood it is only the best quality of sirup that is susceptible of crystallization. Our working now is and will be for some time, as it was formerly in Louisiana with molasses from sugar cane—we are unable to crystalize so freely as to separate the cane sugar from the sirup to that degree that our molasses is poor in saccharine, like glucose fancy sirups. I have not yet formed a sample of the molasses so separated from the sugar that it did not show over 40 per cent. of cane sugar still present, while the three samples, Boston sugar drip, Baltimore silver and St Louis white drip, failed to reveal a particle of cane sugar.

If the above shall awaken the attention of any of the readers of the RURAL who may desire further information, on this subject, I desire it to be known that one of the objects of the Mississippi Valley Cane-growers' Association is to afford information on the matter. Inquiries should therefore be addressed either to the Secretary or myself, at 2,004 Broadway, St. Louis.

AILANTHUS SILK CULTURE.

A FEW years ago an entomologist in Brooklyn N. Y. procured some of the cocoons of the Ailanthus silk worm. From these came the millers or moths. Some of them escaped or were let loose, and the chrysalides from them being hardy, there is now scarcely an Ailanthus trees in the two cities, on which more or less of the cocoons may not be found. The silk of these cocoons is not so fine as, but is stronger and makes a cloth much more durable than, that from the cocoons of the ordinary silk-worm. An obstacle formerly in the way of its use was that the silk could not be readily reeled from the cocoon; but new inventions have overcome that to a considerable extent. Beside, the introduction of machinery for the treatment of the cocoons from which the moth has eaten its way—making the silk into flock and from this into thread for weaving as is now extensively done with the perforated cocoons of the ordinary silk-worm—renders these cocoons of the Ailanthus more readily worked and they would find a ready market could they be offered in sufficient quantities.

There are thousands of acres in many states that could be profitably employed in raising the trees for these worms to feed upon. I do not forget the objection that the pollen of the male tree is said by some to be as unhealthy as it is unpleasant; but no male trees need be raised. Cuttings strike readily and these can be made from the female trees. A little care only would be necessary to have a plantation acres in extent without a single blossoming tree. Beside, the trees will be kept so thoroughly cut in that they will blossom but little. Plant the trees out when a year old. Let loose a few moths among them, and you will have turned a barren waste into a source of revenue.

The trees should be set quite close together and kept cut in to a hight easily reached by ladders. The moths would lay their eggs from which in time would come worms to feed on the leaves. These would in turn spin and affix their cocoons to the trees which could be readily seen and gathered by boys when the foliage was gone. Enough of the cocoons will be missed from which moths will escape to keep up a full supply, and the plantation once started will be a perpetual source of income with very little care and expense. Who will be the first to give it a trial? I might go on and state by measure how close the trees should be planted and how closely headed in, but exactness is not necessary. The trees should be far enough apart to admit light to their roots and the tops should be readily accessible by means of light ladders.

L. A ROBERTS.

Sugar from Amber Cane.

AT a meeting of the Chemung County Tobacco Club the discussion on subjects of tobacco interest was followed by one on the question of making sirup and sugar from Amber-cane.

Mr. Compton, who has had considerable experience in working the cane, said, in answer to numerous questions, "I consider that the business of making sirup and sugar from Amber-cane has been started successfully in our valley. I have succeeded in making some sugar which I shall show at the coming day meeting of the Elmira Farmers' Club. I have made about 1,450 gallons of sirup during the past season, and the prospect is, there will be 12 or 14 mills working in the county next Fall Those who have tried growing the cane for the purpose of having it worked up will increase the acreage if there is a prospect of having it made up, which there is. A mill suitable to work 10 acres will cost $150. I have sold my sirup for from 50 to 60 cents per gallon.

Mr. M. Compton from one-eighth to one-tenth of an acre got 36 gallons of sirup. I think 300 gallons may be produced from an acre, provided good culture is given the crop. The cane should receive better culture than our farmers have given it the past season. With such culture as is given to tobacco, 400 gallons can be produced from an acre. I think the business could be made to pay well in our valley. Last season was unfavorable for the growth and perfection of the cane, yet all who brought cane to me to be worked up, felt well paid for their trouble and expense by the sirup which they obtained. The cane should be treated more as our farmers treat their tobacco crops, if the best results are to be expected. I should plant in rows, north and south, in hills, about 18 inches apart in a row, leaving about five or six stalks to a hill. From an acre of very poor ground I got 100 gallons of good sirup. G. A. G.

Horticultural.

RURALISMS.

ENGLISH journals are complaining, and it would seem justly, of the manner in which Americans pack their apples for the foreign markets. They say, with a good deal of feeling, that the best fruit is now put on the top and the poorest at the bottom, and that the barrels are small. I suppose, however, that the barrel is the usual flour barrel. In contrast to this they call attention to the fact that Canadian apples are not only in larger barrels, but honestly packed throughout. This is a matter for grave consideration on the part of shippers as well of growers; for, aside from its downright dishonesty, it is always in the end a losing game to play. I always read such things with a feeling of shame. It is mortifying to know that such things may sometimes may be found at home, but infinitely more so to find ourselves charged with them in the markets abroad. It is not the way to gain either character or trade. From what I have seen, I am inclined to think that some shippers are more to blame than the growers. Either the grower or the shipper should be compelled to put his name on every barrel shipped, which would in a measure act as a check. There may be many men willing to commit or consent to a fraud, but very few who would be willing to be exposed. I wish some person connected with the RURAL could spare time to investigate the matter and give the facts to the public. I will do what I can in the same direction. If shippers commit such frauds fruit growers all over the country have a right to know it.

THE late Robert L. Pell, of Pelham-on-the Hudson, who was famous for his Newtown Pippins, the best of which went to Europe, used to wrap all his "best" apples separately in paper, no unsound or imperfect fruit being allowed in this selection. He employed no "middle man" or shipper, but sent direct himself, and the prices he obtained were a surprise to those who took no pains in selecting and packing. He made a reputation for himself as well as his country; and as his orchard of Pippins was a large one his profits were large, for he often received as much as $20 a barrel for some of his apples in England from private parties. I know there are more men like Mr. Pell still living; I wish all were like him in this respect. There may be some necessity for overhauling Western apples after their long and rough journey, but none for dishonesty.

I AM sorry the Editor does not quite agree with me about the Climbing Hydrangea. My praise of the plant had reference as much to its usefulness as its beauty. I cannot think of another ornamental, hardy climbing, clinging plant that can be put to so many uses. It may be remarked that there are two forms of this plant in the market; one from cuttings from a *plant* in Japan and the other from *seed* from Japan. The former has the larger leaves, with deeper and coarser serratures. The difference may disappear in time. Wherever I have put a plant, whether on rocky ground, by a wall, or a tree, it has seemed to make itself very much at home; and it is for this reason that I think it will prove to be useful as well as pretty. On the grounds of L. H. Meyer, of Staten Island, there is a very fine specimen that has grown undisturbed since it was planted, and grown very fast.

PROFESSOR COOK'S excellent report on the experiment in feeding cows is a model of its kind, and makes one wish for the establishment of that experimental station, or a section of it, that we are to have near New York, with a man like the professor at the head of it. I should be glad to see a similar report for the Winter months.

I SEE that the Frenchmen, with their wonderful fruits, etc., formerly alluded to in this column, have gone West, and that their character seems to have gone before them, and to be understood by some. Last Winter they had a cool reception in Boston. I hope they will get one at the West sufficiently hot to make up for it. Sometimes they have a few good things, but the only safe way is to have nothing to do with them.

LAST Fall I recommended the Triteleia uniflora for in-door and out-door culture. It has been in bloom with me for over a month, and will continue a month or so more. A pot five inches in diameter has daily in bloom from 30 to 40 of its pretty white flowers tinted with blue. And then it is so easy to grow.

HORTICOLA.

The Megarrhiza Californica.

ON reading the RURAL, dated Jan. 23d, I came across the following hard name, Megarrhiza Californica, which, I think, means a beautiful vine growing all around us, particularly on the uncultivated lands, on the hills and mountain sides, among the brush, rocks, etc., etc. We find it almost everywhere. It is a *weed* which we find in our grain fields among corn, potatoes, etc.; in fact it is a *native*. There are vines of it now several feet long, fresh and green, with bunches of white, fragrant bloom, and green, thorny pods which would make a New-Yorker think of chestnut burrs, if he undertook to open one with his fingers. The seeds when ripe are of various shades of beautiful color, and the children, both Spanish and American, gather them by the thousand to play marbles with. The Spanish call them "Chila cotas;" some Americans call the root "Man-root," as it grows very large and deep in the ground. I have seen roots as large as a man, and I think they would weigh 100 pounds or more! They are very bitter, and one of those big roots, I think, would afford material enough to run Dr. Hostetter's Bitters factory a week or more! I have seen thousands of those big roots on the banks of the road where grading was done on the mountain sides. The pods open when ripe so the seeds drop out like chestnuts. The squirrels eat the seeds occasionally, but find them bitter, too. Now, Mr. Editor, if you want some of those pretty seeds when *ripe*, I will try to send you some to try in your big garden.

Santa Barbara Co., Cal. O. N. CADWELL.

[We would thank our friend for a few of the seeds. No doubt the plant he speaks of is Megarrhiza Californica, now offered for sale by prominent London seedsmen. See illustration, page 52 It is confined to the Pacific coast and very nearly allied to Echinocystis, from which it differs in its immense perennial roots.—EDS.]

Pomological.

THE PEACH.

S. B. PECK.

WHAT I have here to say under the above head, is not to describe the process of growing this delicious fruit from the planting of the pit up to the gathering and eating or marketing the product, neither shall I proceed to give its history, its natural habitat; nor to describe its many varieties with all their individual peculiarities or idiosyncrasies. No: my success, or rather the lack of it, forbids my undertaking such a task. And should I undertake in the choicest language at my command, to describe the tree when clothed in its Spring floral robe, or in its Autumn dress of rich golden yellow or blush of crimson fruit, half hidden by its lively green trimmings, it would only bring to my mind what I have *had* and *lost*. It would bring vividly to mind the fact that after clearing off the forest and planting and tending a few acres of this most popular fruit, and thanking a kind Providence for the rich reward bestowed upon me for my labors, the trees were suddenly blighted and ruined by an untimely frost, and that I have lived to clear off this same land again by tearing up and cremating these dead and decaying trees.

It has been said that there is more to be learned by our failures than by our successes. The advent of unexpected and disastrous occurrences, or startling phenomena, leads often, by a scientific examination into its causes, to valuable results. Had I another life to live I might myself profit by my own failures, but such not being the case, the best thing that opens to me, is, to describe the causes of failure in my own case and that of many others.

To insure any lasting success with this and kindred fruits in this climate, the trees *must be* planted on sloping land. The best slopes for them are to the northward, just the reverse of the best slopes for the grape and all such late blooming kinds that require the whole of the season for their perfection. This may sound empirical as coming from me without the explanation, which I shall attempt to give.

Every peach grower knows that untimely frosts are the main and, I may say, the only drawbacks to success. Every farmer knows that low lands, especially hollows, are more subject to injurious frosts than hillsides, and knowing this fact, he may deem it sufficient for his purposes; but he who is posted in climatology, the much sneered at book-farmer, looks from effects to causes. The weight of a given volume of atmospheric air depends largely on its temperature; the colder the heavier. It receives its heat by reflection from the earth, the latter being heated by the direct rays of the sun. After sundown the earth and the thin stratum of air next above it cool rapidly with an increase of density and weight in the latter which causes it to seek, like water, the lowest level open to it: thus draining off the cooled air of the hills to the valley below it. But this is not all; winds, currents of air, tend to prevent frosts by mixing this cooled air with the warmer above it, and the current of air downwards necessitates a counter current upwards of the lighter and warmer air, to prevent that vacuum which Nature is said to abhor.

My peach trees were planted on ground slightly sloping to the North, and terminating in a very shallow basin, made partially by thick grass and low bushes beyond it In the Spring when, in a few days, they should have blossomed and set fruit, I was pruning, and as I came to this hollow I found the trees all dead, but at an elevation of twenty inches all were sound. None of the trees bore that season. They subsequently bore three times in six or seven years, but succumbed entirely during the winter of 1874-5. During the same time my next-door neighbor's trees, put out at the same time, treated him still worse, because his ground was yet more level.

A friend who by my advice had planted his

trees on the high steep bluffs of Lake Michigan, rather than on the nice flat back of them, as he had intended to do, saved his trees through that trying time, that demolished all on flat grounds. If no where else in the world, the people of Western Michigan, even in this famous Peach Belt, have learned to pay special regard to what we call here "Atmospheric Drainage."

Muskegon Co., Mich.

Industrial Societies.

CHEMUNG COUNTY TOBACCO CLUB.

[Rural Special Report.]

A MEETING was held by tobacco growers of Chemung Co., Feb. 3, near Elmira for the purpose of organizing a tobacco club. After the election of officers and the transaction of other preliminary business the discussion of questions of interest to growers was immediately begun.

Mr. G N. Hoffman said "In order to make our club beneficial and practical, we should tell what we know and then stop. It is a common fault with members of such organizations to make speeches. These embarrass and confuse other members of more modest pretensions who, not being fluent talkers, refrain from giving their experience. We should tell what we *know*, not what we speculate."

N. A. Ward.—"We must educate each other. If we can increase the price of our tobacco half a cent per pound we have done great good. Practical sayings are what we want—not theory.

George Chamberlain.—"We want to know how to improve the crop. To find out which are the best varieties to grow and which fertilizers give the best crop.

Mr. Hoffman.—"Which is the best variety?

Mr. Chamberlain.—"The Lancaster is best with me."

President Miller.—"With me the Lancaster is a failure."

G. A. Goff, Jr.,—"I consider the Ohio Broadleaf a better variety."

Mr. Hoffman.—"I have a five-acre field of clover sod which I want to fit for tobacco. The only manure which I have is cow manure; how can I put the soil in good condition for a crop with only cow manure as a fertilizer?

Mr. Chamberlain.—I should apply the manure in the Spring and plow the ground shallow. Shortly before the time for setting the plants I should plow it again rather deep, then fit the soil in the usual way."

Joel Rutan.—"Manure applied in the row has succeeded well with me and I consider the method a good one when one has only a limited amount."

Mr. Hoffman.—I prefer spreading it on the surface. Cow manure when buried in the soil becomes a dry clod, rendering little benefit to the crop."

John Strouse.—"I would like the opinion of the Club in regard to raising tobacco on the same soil for successive years, without rotation with other crops. Is it best to manure heavily and employ the same ground year after year, or to change the tobacco field and seed it to grass and clover, to be followed by some other crop previous to fitting it again for tobacco?

Mr. Chamberlain.—"It is best to change. You will get better colors and greater yield. Less manure is also required when the soil is seeded to clover occasionally."

Mr. Stronse.—"I thought of sowing my old tobacco field with barley, then follow with wheat and seed to clover."

Mr. Goff.—"If the object is to get it ready as soon as possible it would be best to sow to wheat after harvesting the tobacco, and seed with clover in the Spring."

Frank Copley.—"I consider clover a great help to a tobacco crop. The great benefit of clover is from the root, which fertilizes and loosens the soil."

Mr. Ward.—"With mixed farming it is best to employ several fields for tobacco and practice a rotation. It is not wise to apply all the manure made on a farm, on one single field on which tobacco is grown year after year. It is poor policy to raise a crop that we cannot fertilize with manure made from a rotation of crops."

President Miller.—"That is true. To apply all the manure made upon a farm, on a few acres, will sooner or later ruin the farm."

Milton Beckwith.—"I would like the opinion of the Club, on the use of commercial fertilizers."

Mr. Chamberlain.—"I have tried some of them without benefit to the crop."

Mr. Beckwith.—"I have tried Bowker's and could detect some improvement in the growth."

Mr. Chamberlain.—"The use of commercial fertilizers injures the quality of leaf."

Mr. Ward asked about applying common manure in the hill.

Mr. Shappee.—"I have grown good crops from applying stable manure in the hill."

President Miller.—"This method of applying is practical when it is necessary to make a little manure go over a good deal of ground."

Mr. Havens.—"Drill manuring is too much work in a busy season."

Mr. Goff.—"A great drawback to this method of applying manure is the difficulty in obtaining that which is thoroughly rotted. It will not do at all to apply coarse manure in the row."

Mr. Crooker.—"Too much manure in contact with the roots causes poor colors of the leaf."

Mr. Ward.—"I am not in favor of hill manuring with any crop. Manure in a hill does not dissolve; the next year, it is still there. Manure applied broadcast, becomes thoroughly incorporated in the soil and there is no fear but that the roots will find it, if it is *only there*. Manure cannot make plant food until it has been dissolved."

Mr. Chamberlain.—"Those are my views."

Scientific and Useful.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN NO. 50, DEC. 18, 1880.

Fertilizer Analyses.

500. Forrester's rye fertilizer, made by G. B. Forrester, 188 Pearl Street, New York, sent by M. S. Baldwin, Naugatuck.

502. Ground bone, made by Peck Brothers, Northfield, sent by S. R. Gridley, Bristol.

508. Genuine sulphate of potash.

509. Muriate of potash.

508 and 509 are from stock of A. Lathrop, sent by H. H. Austin, Suffield.

	500	502	508	509
Nitrogen as ammonia	5.00			
Nitrogen of organic matter	.33	4.06		
Soluble phos. acid	4 73			
Reverted phos. acid	.02			
Insoluble phos. acid	1.17	21.79		
Potash	9 45		27.38	53.83
Chlorine	8.75		1.24	
Estimated value per ton	$15.83	$38.40		
Cost per ton	$47.50*	$33.00	$35.00	$32 00
Cost of potash per 100 lbs			$ 6.39	$ 2.97

* In New York.

Bulletin No. 51, Jan. 27, 1881—Fertilizer Analyses.

Analysis of refuse lime from Franklin Beet Sugar Works. Sample No. 516, received Dec. 24, 1880, from Edgar Stoughton, Esq., South Windsor, Conn:—

	Pounds per 100.	Pounds per ton.	Trade val. per lb.	Est. value per ton.
Moisture	42.19			
Carbonic acid combined water and organic matter	23.99			
Lime (calcium oxide)	19 85	397.0	4-10c	$1.59
Potash (potassium oxide)	.32	6.4	6c	.38
Phosphoric acid	3.10	62 0	9c	5.58
Nitrogen	.44	8.8	20c	1.76
Total estimated value per ton				$9.31

Lime is here valued at its cost shipped in casks at New Haven, *i. e.*, $4.40 ($0 40 less value of casks) per ton of slaked oyster-shell lime with 60 per cent. of *pure lime* = 1 200 pounds. The cost is 37 cents per 100, or 4-10 cent per pound. The same lime is to be had at the kilns in bulk for 1-4 cent per pound. These are perhaps not present prices.

Sorghum Seed.

XC. Seed of Minnesota Early Amber Cane, from E. M. Dunn, Grafton, Mass.

XCII. Sorghum seed, from E. D. Pratt, West Cornwall.

COMPOSITION.	Air-dry. XC.	Air-dry. XCII.	Water-free. XC.	Water-free. XCII.
Water	15.04	16.76		
Ash	1.78	2.17	2.04	2.60
Albuminoids	8.13	7.67	9.57	9.23
Crude fiber	1.94	3.21	2.28	3 85
Nitrogen-free extract	69 65	66.81	81.88	80.30
Fat	3.51	3.36	4.13	4.02
	100.00	100.00	100.00	100.00

Probable amount of digestible nutrients in air-dry substances:—*

	XC.	XCII.
Albuminoids	6.59	6.23
Carbohydrates	62.47	60.26
Fat	2.60	2.40
Nutritive ratio	1:10.4	1:10.6
Estimated value per 100 pounds	$0.96	$0.92

* No determinations of the digestibility of sorghum seed have been reported. Its composition is quite similar to that of the ordinary cereal grains, and it is to be anticipated that it will prove equally digestible. In computing the above table, the averages of the digestion coefficient for all the cereals yet experimented upon were used.

Kiln-Dried Brewers' Grains.

Brewers' grains, *i. e.*, the residue of barley after it has been malted and used for making beer-wort, has long enjoyed a high repute as cattle food, especially for milch cows; and notwithstanding the fresh grains contain an average of 78 per cent. of water, they are much sought after by farmers living within a few miles of the breweries. During the warmer season, however, large quantities sour and spoil before they can be fed. The only plan of saving them hitherto has been by putting them into pits after the manner of ensilage. Recently it has been attempted to make them capable of indefinite preservation and of easy handling by removal of most of the water, which not only constitutes three-fourths of their weight when fresh, but renders them susceptible to damage. The sample whose analysis is herewith given has been thus prepared. This sample was brought to the Station by A. J. Ramsdell, Esq., of New Haven:—

	Kiln-dried brewers' grains. XCIII.	Oats. Average.
Water	2.57	13.7
Ash	3.97	2.7
Albuminoids	20 38	12.0
Crude fiber	11.79	9 0
Nitrogen-free extract	54.89	56 6
Fat	6.40	6.0
	100.00	100 00

The amount of water above found is perhaps smaller than can well be practically realized on a large scale. On exposure to air, the grains containing but 2½ per cent. of water will no doubt gradually absorb several per cent. of moisture. With even 10 per cent. of water the dried brewers' grains will be, so far as chemical analysis can indicate, equal or superior to any grain or seed commonly used among us as food for animals. They correspond most nearly to oats in their composition, containing the same proportion of fat, a little more fiber and ash and some eight per cent. more of the most costly and valuable food elements, viz., albuminoids. Peas, beans and flax-seed are the only seeds raised at the North which contain so much albuminoids. If experience shall show that the drying of brewers' grains can be carried on economically, the process will save a large amount of valuable cattle food from waste.

I understand it is claimed by some that the drying of brewers' grains seriously injures them for feeding purposes. This notion is in agreement with the idea put forward by the partisans of ensilage, some of whom assert that dried corn-fodder is greatly inferior to a corresponding quantity of the same put down as ensilage. In total absence of any exact comparative trials these claims must be regarded as entirely questionable. Without doubt dry brewers' grains may be considered equally nutritious with dry grains of any sort that correspond to them in chemical composition.

Paris-Green on Corn-Stalks.

Under date of Sept. 17, Mr. D. C. Spencer, of Old Saybrook, wrote the Station as follows:—"Last Spring I applied Paris-green, mixed with water, to my corn when it was about three to five inches high, to stay the ravages of the army worm. I desire to know whether you have analyzed any corn thus treated, or can inform me if it will now be safe to feed the corn-stalks and husks? If not, will the Station analyze a sample for me?"

Mr. Spencer was requested to forward to the Station a dozen or fifteen stalks taken from different parts of the field. The sample came in good order, well tied up in papers and secured with sacking. The stalks were run through a straw cutter, and all the dust, together with a good portion of the well-mixed cuttings, were examined by Dr. Jenkins for arsenic. No trace of this poison could be found by the processes which serve to detect 1-50000th of a grain of white arsenic. It thus appears that the Paris-green applied to the young plants had been completely removed by the rain. It has been well established by Dr. McMurtie that vegetation takes up into its interior no arsenic from the soil with which Paris-green has been mingled in the quantities which are used for destroying insects—a result which is fully confirmed by this examination.

S. W. JOHNSON, Director.

THE METRIC SYSTEM OF WEIGHTS AND MEASURES.

THE graphic characters representing volume, quantity and space, and increasing in tenfold proportion, are said to be of Arabic origin, and that in all written languages the same characters are used, being thus part and parcel of a universal language. What a pity that these same ingenious Arabs did not invent for us, the English-speaking people, a more rational and convenient system for the division of commonly accepted units in all measures and weights, decreasing in tens or decimals, instead of, as now, the unit gallon decreasing by 4 2.4, and the unit pound avoirdupois by 16.16, and the division of all our other weights and measures varying all the way from 4 to 24. In our legal currency the thing is perfected, the divisions of the unit dollar being in tens, hundreds, and thousands, it can be carried by the same principle of decimals as much lower as any one has occasion for. The French people, too, have carried out the decimal principle, both in their currency and in all their weights and measures, thus simplifying all calculations in which figures are concerned.

This system of the division of units by tens is in France the only legal method, but in the United States the system is simply legalized, and can be used or not as the sovereign people please: but whether this very simple, convenient and desirable method will come into general use here is a question as yet unanswered. The great difficulty in the way of a transition from our most unmitigated jumble to this simple and plain French system, is that the differences in the units of the two systems cannot be expressed either by whole numbers or decimal fractions. Thus the French meter is very nearly expressed by three and twenty-eight one-hundredths feet, but cannot be expressed exactly without the much less convenient resort to vulgar fractions; and so with the French liter, it is a little less than our quart of dry measure and a little more than our quart of wine measure, but the difference in neither case can be expressed precisely by decimals. This difficulty is likely to be always in the way of bringing this French metric, or decimal, system into general use here, however much we may lament the gross inconsistencies in the terms we use and the manner of our divisions and subdivisions of units. The French word "meter" corresponds with our word measure in some of its various uses, but while our neighbors, as far as I can see, apply it only to length and breadth, we use it in the measurement of land, whisky and potatoes. Thus the man who asked his grocer for five pounds of oysters, on being told that he did not sell them by weight, but by measure, at once changed his application to five yards.

Our word "dram," or "drachm," means the sixteenth part of an ounce avoirdupois, also the eighth part of an ounce apothecaries' weight; also what one pleases to drink at one time, more or less. Thus the Teuton, more familiar with drams than ounces, called in a Yankee M. D. to prescribe for his bad health. The doctor, readily seeing the necessity for restricting him in his potations, and foreseeing the danger of total abstinence in a diagnosis of *delirium tremens*, prescribed one ounce of brandy per day, with an earnest injunction to be very exact in the amount. Well, the doctor gone, the next thing was to measure, or weigh, this exact quantity, and in this difficulty the son, who had had a considerable sum laid out on his education, was appealed to, and very correctly informed his sire than an ounce was sixteen drams.

The word quart leads to a good deal of confusion, as well as not a little cheating, it being one thirty-second part of a bushel and containing 67 2 cubic inches, and also one-fourth of a gallon wine measure, containing 57 75 cubic inches, the difference being 9 45 inches, and still how many dealers in bushels and quarts understand that the bushel contains only 32 dry-measure quarts, while it contains 37 and nearly a quarter quarts of wine measure? When "Lo," the poor Indian, or the small boy comes in with blackberries, the grocer measures them with the half bushel or peck, but if Mr. "Lo" wants a quart of peanuts, they are measured in the tin quart cup, and it is generally "Lo" and the boy that get cheated; but now-a-days boys go to school and some of them sometimes learn something to their advantage. Thus a friend, at my elbow as I write, tells that in his boyhood he picked two half-bushels full of blackberries, but before he reached the grocer's with them they were considerably shrunken in bulk, and though the price per bushel was agreed upon, it was required of the boy that the one measure be filled up from the other, and that what remained in the half-bushel should be measured out. The boy, seeing there was nothing to measure with but the tin quart cup which the grocer sold by, consented—result, the fraction of the half-bushel turned out to be worth more than the full one.

Who among the boys who graduated at a country school 50 years ago ever understood, or even now understand, the difference in quantity between the avoirdupois and the Troy pound? Doubtless the boy then learned that the one had 13 ounces and the other 16, at the same time that he learned that three barley-corns made one inch and that four quarters of a yard made one yard; but country school-keeping kept on nearly up to the present time before Young America was taught that though the Troy and apothecary pounds were alike, it took one pound and nearly a quarter of them to balance one pound avoirdupois. If ever the metric, or decimal, system is adopted and becomes familiar here, all this jangle and confusion will be obsolete; but, if I were 60 years younger than I am, I should hardly expect to live to see this very desirable thing brought about—or the proposed spelling reform, either.

S. B. P.

Miscellaneous.

RURAL BRIEFLETS.

COMMERCIAL MANURES.—If we are to judge by the increase in the business of our leading concentrated fertilizer firms, the use of these fertilizers must in the main, give satisfaction. On this subject, we wish all of our readers were familiar with the careful and long-continued experiments of Dr. Lawes of Rothamsted, England. True, England is not America. But land there, as here, must supply plant food or crops must fail. Dr. Lawes's experiments show that concentrated fertilizers *do supply* to the soil what plants remove in a condition

available as food. A circular before us from the Bowker Fertilizer Company of Boston and New York, gives an illustration of the growing demand for commercial manures in this country. The business was commenced in 1873 when fifty tons only were sold. Several years after, the Stockbridge manures were introduced and the sale amounted to about one thousand tons for the year. In 1878 additional extensive works were erected, capable of turning out 100 tons of mixed fertilizer a day, and in July last the capital stock, as we learn, was increased to $400,000, and new works erected at New York. Last year 15,000 tons of fertilizers were manufactured and sold by this firm alone. As a rule, the value of commercial fertilizers can not be ascertained in one season. Yet in favorable seasons, their effects are ofttimes very manifest. The Rural Farm has not, as yet, made any tests with them which have either enabled us to answer the question as to what *special* fertilizer our soil most stands in need of, or to what extent any crop has been benefited by manures specially prepared for such crops. It is evident that to render such tests of any positive value, the soil *must* be uniform and an unmanured plot must be cultivated and planted in precisely the same way as the manured plot. Until farmers are willing to put themselves to this trouble, they can never arrive at trustworthy conclusions. We propose next Spring, according to the plan indicated, to test upon corn and oats at least, and possibly upon Spring wheat and potatoes, the concentrated fertilizers purchased from several of our leading houses and to publish the results whatever they may prove to be. . . . . .

Our venerable friend, Mr. S. B. Peek, of Michigan, makes the following request:—"I wish some one of the thousands of patrons of the Rural would give, in the latter, a description of the grape rot, its appearance, time of its advent, its effect upon the fruit and the plant, and whatever they may know of its causes. I have read much of its prevalence in certain sections, and of its blasting effects, especially the report of Mr. Taylor, the Government microscopist, of his examinations as to its cause in New Jersey, but have never, to my recollection, seen a full description of it." . . .

Anent the "Great Cuzco Corn" we have received the following communication which explains itself. All attentive readers of the Rural New-Yorker should remember that we tested this corn and reported that it was worthless, in time to have guarded them against its purchase:

"I see in different papers that this big corn humbug is still alive. I will give my experience with it for the benefit of Rural readers. I received twelve or fourteen grains from a man in Springfield, Ohio, for which I paid him twenty-five cents. I planted half about the 18th of April with some other corn beside some Blount Corn. After it grew to be knee-high, I could easily see differences. It grew stronger; the tassel came out differently. I watched for the ear, but no ear came. It crooked over and put out brace-roots at every joint for five feet high. I began to think the ear had changed into roots. The balance I planted about the 15th of May. It grew the same as the first, and as it stood on very high ground, I let it remain till the frost killed it. One stalk had a small ear covered by a half-inch thick husk. The cob was about three inches long, with half a dozen thick, flat grains in a milky state. Now I think that any man that will advertise such a cheat, ought to be ashamed of himself, for it is simply a humbug. GEO. KRAFT.

Litchfield Co., Mich.

What Others Say.

Fat Cattle at Fairs.—At a recent meeting of Kentish farmers in England, Lord Harris said he wished to know if the fattening of beasts as conducted at the present day was a lucrative business to the farmer, because he could not help thinking that this was a time when the pursuit of agriculture ought to be conducted on very economical principles. When at the cattle show that day, it so happened that as the fat cattle were being led around the ring a gentleman pointed out to him a very fine animal, of which he was the exhibitor. A person standing near by said he would like to know how much it had cost him to fatten that beast. The exhibitor made no reply, but held up his hands and walked away. If Lord Harris should ever happen to visit this country and attend any of our cattle shows, he would find it just as difficult to learn the cost of the fat on their bones as he does in England. The cost is seldom taken into account when our farmers are preparing stock or anything else for the show, and this is just why so little practical information is to be obtained at our great and expensive annual fairs.—N. Y. Sun.

We find the following in the London Mark Lane Express. Anyone who desires to understand the causes of the bitter feeling which most Irishmen entertain towards England and English owners of land in their country should read a pamphlet written by Mr. T. M. Healy, M. P., entitled "Why there is an Irish Land Question and an Irish Land League." It is chiefly a compilation of quotations from various writers and public speakers, and is all the more telling on that account. No more damning indictment of the treatment of Ireland by England could well be conceived. It is true that the most horrible records relate to a period long past; but feuds are often hereditary, and England has not yet half atoned for her crimes against Ireland. Moreover, since 1870 no fewer than twenty-nine Bills relating to land in Ireland have been brought forward in the House of Commons, and either rejected, dropped, or withdrawn. The pamphlet is published by Gill and Son, of Dublin, and is sold at a shilling. Of course it gives only one side of the case; but then there is only one side to a great portion of the case of Ireland.

Col. Curtis says, in the N. Y. Tribune, the farmers wonder how he can winter his pigs so well on raw roots. It is, he emphatically replies, because his pig-house is WARM! That word tells the whole story. . . . . .

Ninety-nine stables out of a hundred are full of cracks and holes, the Colonel says, and the manure freezes under the cattle's feet. What a preposterous notion that cattle should be turned out of such places to get fresh air! Equally ridiculous is the idea that they must be turned in the yard for "exercise" where they do not average a walk of 10 rods a day! He knows from practical experience that cattle are more liable to accidents while left in the yard than if kept in the stable, and he knows *that cattle will keep in as good condition in a comfortable stable on half the feed.* This is the testimony of farmers who have changed their practice from the out-door to the in-door system.

E. Y. Teas, of Indiana, has produced a beautifully variegated form of the Sugar Maple. The original tree, as we learn from the Botanical Index, has grown to a large size and still holds its variegation during the entire Summer. It is being propagated for sale. . . .

Everywhere.

NOTES FROM EASTERN OHIO.

We are having the closest Winter in Eastern Ohio that has been for 25 years. In the Winter of '55 and '56 the Ohio River was frozen over three times, and it is now closed the third time this Winter. Cold weather set in last Fall, the middle of November; since that time there has never been mud on the roads, and, with the exception of about ten days, the ground has been covered with snow. The first snow now on the ground fell on the night of December 19, and since then the sleighing has been excellent except for the past week the roads have become so badly drifted in the lanes that travel has been somewhat interfered with. The week between Christmas and New Year's was intensely cold, but since then it has been pleasant Winter weather, until this week the mercury has gone down as low as 30 degrees below zero.

I never saw more corn in the fields at this season of the year than at the present time; but farmers are commencing to haul it into barns to husk, in order to get the fodder. Owing to the dronth last Summer the hay crop was a very short one, and with such a hard Winter it will be fed up very close, and is causing people to utilize wheat and oat straw, which is fed to all kinds of stock. Sheep and cattle were sold off very close last Fall. A great many of the former were bought by Western men and shipped to Kansas and Nebraska, but with all the drawbacks which it has been subjected to of late the sheep and wool interest in Ohio was never in a more prosperous condition. The American Merino has got the lead, and is brought to a state of perfection unsurpassed in any portion of the United States. There are but few sheep or cattle being fed for market, and the prospect is certainly very encouraging for good prices in the future. Although the bulk of last year's wool clip is sold, there are yet a good many lots still in the hands of growers. The prices realized ranged from 40 to 46 cents per pound washed on sheep.

There has been an immense quantity of wheat put into market since snow fell and the bulk of last season's crop is sold. Prospects for the coming crop are not as favorable as desired, but it has been pretty well protected by the snow. I think there is danger from the heavy crust which is on the snow, of some of it being smothered.

There was a great scarcity of water for stock during the early part of the Winter, but with an occasional rain the springs have been replenished, and there is now no trouble in that direction. The general health of the county is good, with fair prospects of prosperous times, and people mostly seem disposed to make the best of everything.

Irondale, O. M. N. R.

NEBRASKA FIELD NOTES.

In 1879 four acres in field No. 1 were plowed six inches deep with a stirring plow and sown to Hungarian Grass at the rate of half a bushel per acre. A week later eight acres in the same field were sown and cultivated in the same manner save the plowing, which was not over three inches deep. The four acres yielded twelve tons of hay free from weeds and other grass. The eight acres yielded about four tons of hay, a large amount of weeds and what the renter called Foxtail Grass. The marked difference in results cannot wholly be attributed to deep plowing. After the four acres, but before the eight acres were sown, a heavy rain fell. The smaller plat was lying up loose and mellow, and it drank in a very large per cent. of the rain-fall. If there were weed seeds in the soil the rapidly-growing grass gave them no opportunity to germinate. On the unplowed ground and shallow-plowed ground a much larger per cent. of the rain-fall ran away, the grass seed was slow to come up and the weeds triumphed.

The Winter of 1879 and '80 was extremely dry as was the Spring and early Summer of '80. In March '80 I began plowing for corn these two plats, or rather the entire field, running the plow in an opposite direction. I found no difficulty in plowing six inches across the four acres, but found it almost impossible to force the plow to a proper depth where the plowing was shallow the preceding year. On the four acres the corn made a pretty even start, but was killed by subsequent drought. On the eight acres not one kernel in a hundred made a start. Seeing that the corn must prove a failure I allowed the grass to grow and took, thanks to late copious rains, about one ton per acre from the four acres, and about a half ton per acre from the eight. My neighbors thought I was ruining my land by letting the Foxtail get such a hold; but my hay this year is worth six dollars per ton I am wintering ten cows on the hay and it seems to be "A No. 1" for them. R. H. C.

RURAL SPECIAL REPORTS.

Cal., Carpenteria, Santa Barbara Co., Feb. 4.—The season has opened fine indeed for us Californians. The rains came just at the right time. Weeds, grass, volunteer grain, etc., etc., afford plenty of rich, succulent food for cows and other stock that have the privilege of picking up a livelihood. Farmers are busy plowing, sowing grain and flax seed, planting fruit trees, etc., etc. Crops of all kinds were good the past year. We had a fine crop of Lima beans, a part of which were sold at three to 3½ cents per pound, but the market has closed, so we have no chance to sell now, and if our beans are not wanted in New York, Boston, Philadelphia and other Eastern places, we are caught this time without fair wages for our work in raising and harvesting them. There has been more frost the past Fall and thus far this Winter than usual, but no harm has been done. Flowers bloom all the year, and I have some very fine roses in bud and blossom, with many other flowers too numerous to name. The tiny orange buds are beginning to show themselves—so sweetly too! I have, too, long vines of smilax, four to eight feet, so full of the sweetest little blossoms which fill the yard with perfume the most pleasant. Surely we have much to be thankful for in this fair clime, Pomona's Retreat. O. N. C.

Kansas, Parsons, Feb. 8.—A thaw set in on Saturday, the 5th, after 80 days of continuous freezing. It rained Saturday, Sunday and part of yesterday. The frost is out of the ground, except where the sun does not reach it. The wheat is all right, or, if not all right, at least as good as the average appearance at this season. Our streets are puddles of mud, and country trade is suspended. Railroad men seem more crazy than ever on the projection of new lines. In Kansas and Texas railroading seems the dominant business. It suits the yeoman if he doesn't vote bonds. Apples, half crop; pears, do.; peaches, apricots and nectarines, none; cherries, sweet, none; sour, half a crop; blackberries, young plants all safe, old plants, half a crop; raspberries, Black-cap, half a crop, red half a crop; strawberries, where mulched, a full crop; gooseberries all right; currants not grown. The apple trees that have been much cultivated, and whose growth has thereby been stimulated, are in the worst condition, as the sudden and intense cold of Nov. 15th damaged them severely. J. B.

Kansas, Chapman, Dickinson Co., Feb. 1.—We are having a long, cold Winter, with a great deal of snow, which is very good for the wheat. This had a good start in the Fall, and I expect it will come out all right in the Spring. The cold has killed a great many of the peach buds. L. H. E.

Minn., Winona Co., Feb. 5th.—Winter came on us earlier than ever known since the first settlement of this country—nearly thirty years ago. We have had a good deal of cold weather; the mercury has been down as low as thirty degrees below zero. Very good sleighing since Christmas, though we had not very much snow till within a few days. Now, we have at least, two feet of snow in the woods where the wind has not disturbed it. Our railroad extending from the Mississippi west through this State, was completed through Dakota to Fort Pierre on the Missouri last Fall. From there a stage route was established to the Black Hills, thus establishing a shorter and more direct thoroughfare to that country. The cuts on the western end of this railroad were all filled with snow last October by a very severe storm known as a "blizzard" in the northwestern prairie country. What the poor settlers along the other end of the road, who are depending upon the railroad for fuel and supplies, will do, is more than I can tell. This has been a great wheat country. All wheat, wheat! But during the past three years it has been a partial failure in Southern Minnesota, farmers are turning their attention to other pursuits. We raise good corn and oat crops. Barley the past year or two has been a great crop, and Minnesota barley is sought for and brings better prices in Milwaukee and Chicago than barley grown farther south. An immense area will be sown to it the coming Spring. Sheep do admirably in this climate and were it not for the dogs and wolves, wool growing would be one of the great industries of this State. D. B. E.

Mich., Muskegon, Muskegon Co., Jan. 31.—The Winter has thus far been very favorable for the chief business of western Michigan—that of lumber. Snow came early and in about the right quantity till about the middle of Jan., since which time there has been rather an excess. The thermometer has several times indicated a few degrees below zero, I think eight is the lowest, and that but once; fruit buds, germ uninjured; the few peach trees near my house are all right and when the peach is safe all other fruit is expected to be so. S. B. P.

New Jersey, Monmouth Co.—Peach buds in this county are badly Winter-killed—not more than a quarter at the outside remaining uninjured. In low situations they are entirely killed throughout the county. J. T. L.

N. Y., Eagle Harbor, Orleans Co., Feb. 4—Our Winter has been a very pleasant one thus far—snow for two months and only one or two warm days, and but two very cold ones. On December 30 the mercury fell to 16 deg. below zero; since then it has remained from 10 to 20 above. Fruit buds are all right so far. I have on my table a dish holding water and some wood of the cherry, plum and peach; the cherry and plum are in full bloom; the peach will be in a couple of days. A. S.

N. Y., Ithaca, Tompkins Co., Feb. 4.—Thawing rapidly; wheat looking well where the snow is off. Hay scarce and dear—$18 per ton; straw $8. Many horses and cattle have been wintered on the latter. All stock looking well. I. P. R.

Ohio, Millersburg, Feb. 13.—I am not a subscriber of your paper, but I thought a few lines from this section of the country, might interest a few of its many readers. The Winter has been exceedingly cold, throughout. The mercury was the lowest on the morning of January 12th, it being 16 deg. We had good sleighing from November 12, 1880 to February 8, 1881, when we had our February "thaw," but it is now frozen up again, and snowing at present writing. Stock look well, but if we have a late Winter, feed will be very scarce. Hay is selling now, from $12 to $15 per ton and scarce at that. Farmers as a general thing are keeping more stock this Winter, consequently there is a greater demand for feed. Many farmers are feeding their corn and fodder together, being unable to get it husked last Fall before the cold weather set in; they are compelled to do it. Wheat looks badly, frozen out in many places. It is selling at 95c to $1.; flour, $5 50 to $6 per bbl.; rye, 50c; oats, 30c; barley, 50c; corn, 40 to 45c; lard, 7c; butter, 16; eggs, 15c; green apples, per bushels 40 to 50c; potatoes, 45c to 55c. The latter are scarce. Many people had all they had frozen in their cellars. G. U. D.

Ohio, Lucas, Richland Co., Feb. 10.—The prices of stock are very low. Hay is high-priced. The peach buds have all been killed. W. D.

Pa., New Lebanon, Mercer Co., Feb. 2.—The snow is over two feet deep now, and drifted everywhere more or less. After the dry Summer, water is scarce now, as there have not been rains enough during the Winter to start the wells and springs that have failed. I think it will be favorable for the wheat that the snow has never been off since the first fall. Fruit is all right yet, as there have been no freezing rains to do any damage. The crops of last year were very good, excepting corn, which did not give a very large yield to the acre, but the fodder was very fine. Hay was very good; feed is plentiful. Farm products are selling as follows:—Hay, $15 per ton at barn; oats, 35c. per bushel; corn, 30c.; apples, 30c.; potatoes, 40c.; butter, 22c.; eggs, 28 cents. J. E. C.

PA., Shepherdstown, Cumberland Co., Feb. 4.—The intense cold of December 30, 31, and January 1 killed all our peach buds, except on high localities. This is a hilly section. At an altitnde of 350 feet above creek level one-half of the peach buds arc good. In the Cumberland Valley all are killed and no doubt many trees. The minimum temperature here was 16 deg.; at creek level 26 deg. On Jan, 30, 1873, the minimnm temperature here was 21 deg.; at creek level 33½ deg. Cherry buds are good. E. H. C.

R. I., Jamestown.—I wish to thank you for the rare seeds you have sent in years past, and to express through the columns of your paper my appreciation of its merits as a horticultural paper, as which I think it takes the precedence of all our rural and agricultural journals. Among the seeds distributed two years ago by the RURAL NEW-YORKER were those of double Hibiscus Syriacus, of which I raised quite a number of plants, three of which bloomed late last Fall, all being double and of different colors. I also raised four Dutchman's Pipe vines, some of which are over three feet high. I prize them much, as they are so different in foliage and flower from any other of our hardy climbing plants. The Beauty of Hebron potato has so increased that I now have all the seed I want for the next year's planting. I find them early and prolific. You will readily see that I gained more from the seed distributed that year than the paper cost me. It has been the advice of the RURAL to send for the floral catalogues advertised in its columns and select from those that advertised what was wanted at the most reasonable rates. Three years ago I ordered plants and seeds from no less than 13 different establishments by mail. In conclusion I will say if any one wants a nice vine for piazza, don't fail to order a Buist's Hardy Passion vine. There was one included in my collections last year which grew 20 feet, and besides being the handsomest vine I know it was in bloom for two months. I have ordered one this year, fearing the severe Winter has killed mine, which I prize ten times its cost. Again thanking you for your choice seeds and valuable paper, I remain, J. J. W.

TENN., Thompson Station, Williamson Co., Feb. 8.—I have but recently become a subscriber to the RURAL, hence, my commendation may be of little worth; yet I wish to add my testimony to that of thousands who have long known your paper, that it is, in my judgment, one of, if not the best and most ably edited agricultural journals published. Permit me to thank you for the White Elephant Potato recently sent. I shall try its virtues when the season permits. I hope you will accompany the Rural Branching Sorghum Seed with instructions as to its cultivation, and how to harvest it for fodder. (We shall. Eds.) I want it as a Winter feed for young cattle and mules if they will eat it. We have had a very severely cold and protracted Winter for this latitude. Tennessee has rarely seen so much hard freezing, so much ice and snow and cold rains. Yet I think the wheat generally, has not been seriously killed out. I do not hear any complaint of fruit-buds being killed.

I hope the RURAL will be kind enough to give us Southern farmers—occasionally—the benefit of its advice and experience; in other words, that it will not be an agricultural paper published exclusively for the benefit, and in the interest of, the Northern and Western farmers. We need all the light we can get in the South, upon every improved method in farming; and as our section is sadly behind in agricultural literature, many of us look to our more highly favored neighbors and gladly receive any suggestions which prove valuable. W. H. C.

TENN., Chattanooga, February 8.—I see in the RURAL of January 29—C. C. of Damascus, Pa., asks about the Chester County Mammoth Corn. I think if he will write to Steven Darlington, Painter's Bridge, P. O., Chester Co., Pa., he will find out all about it, for if I mistake not, he is the gentleman who, from careful selection of seed for many years, produced the variety. I sent to the old gentleman for seed five years ago when we first came to Tennessee, and our corn crop produced a great excitement in our county. We named it the Darlington Corn. The country folks in Lewis County call it Hale Corn. C. W. H.

TEXAS, Dayton, Liberty Co., Feb. 7.—The cold wave that visited us during the holidays, made sad work among my tender shrubs and roses. The few orange trees I have, though well protected by pine saplings, look sickly, and will lose all their leaves. The bark, however, is not split, and I think they will recover. The garden looks black. My Marechal Niels suffered most. That worthy, the "oldest inhabitant," says it was the coldest spell ever experienced in Texas. Ice formed on the prairie, in pools, solid enough to bear up a horse and remained so for four days. Irish potato planting is now going on. A. A.

VA., St. Stephen's Church, King and Queen Co., Feb. 1.—I was startled at seeing in the RURAL lately a statement of a North Carolina correspondent that the peach buds in that section were killed, and I proceeded at once to examine them here. I find that most of them seem to be dead; a few look as if alive. I have never known peaches to be killed in the bud but once here before, and that was in January, '56. I think the cold has been more severe this season than that, though the very severe weather continued longer then. Farmers here often do a good deal of plowing in the Winter; but the ground has been frozen now for more than two months. I have had to discontinue getting fence rails because the pine timber is frozen. I. R. G.

VA., Stafford Co., Feb. 5.—We are having the coldest weather in Virginia I ever experienced. The thermometer is frequently at zero. Snow has been on the land for last six weeks and there has been a continual freeze. I. P.

The Querist.

ANSWERS TO CORRESPONDENTS.

Fertilizers.

F. W. S., Baden, Pa., asks, 1, what would be the best way to treat a field of wheat which has been sown to wheat the second time without any manure except a clover sod being plowed under the first time; 2, would superphosphate of bone be good to broadcast on it in the Spring; 3 would plaster do as well as bone? His soil is partly clay and partly gravel, is high and dry and naturally rich; raised a good crop of wheat on it last year; 4, of what value is salt on such land; also, of what value is lime in Spring, and how would all the ingredients do mixed, and what should be the proportion. Please tell me the price of bone and plaster in New York, and if the Buffalo is best; 5, would it do to sow any or all the above ingredients with a grain drill, by removing the tubes, or would sowing broadcast by hand be better?

ANS.—1. We should risk the crop without any manure. 2. We do not think the question can be settled definitely. Probably it would help the crop if sown early. Perhaps the field does not need bone. 3. This can be ascertained *only* by experiment. Plaster has no appreciable effect in some cases. 4. We cannot say. Sow a bushel on a quarter of an acre as an experiment. Lime may have an excellent effect. We should not mix them together. Send for the circulars of Bowker & Co., Mapes Fertilizing Co., New York, and to Mr. Crocker, of Buffalo. We do not know which is the *best*. The establishments mentioned sell fertilizers which may be relied upon as being what they purport to be. 5. It could be sown more evenly by hand.

Poultry Disease, etc.

W. H. C., Thompson's Station, Tenn., asks, 1, for a remedy for what is there known as "Leg Disease" among poultry. When just attacked a weakness appears in the legs, which rapidly grows worse; the hen loses her appetite, wastes away and dies; 2, whether coal tar is useful for preserving the lower ends of fence posts; 3, are all subscribers to the RURAL required to forward postage stamps for our Seed Distribution.

ANS.—Several diseases affect the legs of fowls, but which of them is indicated by the above scanty description is hard to tell. There is a disease known generally as "Leg Weakness," which generally occurs in highly fed fowls and fast-growing chickens. As a remedy, give the affected birds animal food once a day, and in warm weather dip the legs once a day for a week in warm water. Also give them once a day three or four grains of ammonio-citrate of iron, (to be had at the drug-store), dissolved in water and mixed in their feed. Keep them from wet grass. 2, An application of coal tar unquestionably preserves fence posts. 3. All are required to send stamps except those who subscribe through any of the journals with which the RURAL clubs.

Tanning Horse-Hides.

T. H. W., Oberlin, Ohio, asks if the RURAL can give directions for tanning a horse hide with the hair left on.

ANS.—The best way is to send the hide to a tannery and have it done in a proper manner. If this cannot be done, the next best way is to tan the hide in the manner in which buffalo robes are dressed. The hide should be steeped in water and the flesh side thoroughly well scraped. It is then covered with a mixture of equal parts of salt and alum, doubled with the flesh side in and left for a week. It is then stretched out over a log or bench and scraped and again dressed with the salt and alum. This is repeated until the hide is thoroughly saturated. It is then stretched out on a frame and well rubbed with chalk and a piece of board held by one edge by which the skin is made soft and pliable. A good deal of rubbing and working will be required to make the skin soft. It may finally be dressed down with pumice stone. When $20 worth of time, labor and material have been used, you will have a very poor substitute for a buffalo skin worth $5.

A. W., Oneida Co., N. Y., would like to know the comparative value of hard and soft wood ashes; also, the value of soot in chimneys where wood is used.

ANS.—Hard wood makes more ashes than soft wood, but there is not much difference in the ash itself. For instance, the following woods contain the stated quantities of ash, and the ash contains the stated quantities of potash:

	Ash. per cent.	Potash in ash. per cent.
Birch	.31	11.6
Beech	.65	16.1
Oak	.66	10.0
Willow	1.15	14.0
Elm	2.20	21.9
Maple	2.40	20.5
White Pine	.28	15.3
Larch	.32	15.3

Pine gives less than half as much ash as beech, but the ash is nearly as rich in potash. The hard-wood ashes are about twice as rich in phosphoric acid as the soft-wood ash. The soot from wood fires is nearly all fine ashes. That from green wood contains some ammoniacal products precipitated with the condensed moisture from the wood; that from dry wood differs very little from the ash itself.

Herd Books.

Young Farmer, Camden, Del., I have a thoroughbred Alderney cow obtained from a herd formerly registered. She now has her first calf from a registered bull, and I wish to have them registered. Which is the very best herd book to enter in and how shall I proceed.

ANS.—There are two Jersey Herd Books, one is the herd book of the Jersey Cattle Club of which Geo. E. Waring, of Newport, R. I., is the Secretary and the other is the Jersey Herd Record. The latter is but little heard of and we do not at present remember its whereabouts or the officers' names. Your best plan is to find from the owners of the herds to which your cow and the bull belonged, where and how they were recorded and to write to the Secretary of the particular herd book for blanks of registry. It is probable that the J. C. C. H. B is the one you will want, and by writing to Mr. Waring you can get the desired information. This Herd Book only receives entries of cattle that are descended from animals already entered.

Miscellaneous.

A. S., Eagle Harbor, N. Y., asks if it would be advisable to build an ice-house with milk-room attached; and if so, how shall it be built. Would it do to have the drain from the ice pass through the milk-room; and if so, how should the bottom of the ice-house be built. Would the dampness be detrimental to health, in doing the necessary work in taking care of the milk in warm weather?

ANS.—Your plan will not work. Many persons have tried it and all have failed. It wastes the ice and does not cool the milk. Your best plan is to set your milk in deep pails, in a cistern, a trough, or pool covered from the air, and use the ice in the usual manner to cool the milk directly. A water-tight box is easily made of plank for this purpose. It would require many times more ice to cool the air of a milk-room than to cool the milk itself. Fifty pounds of ice will cool 200 pounds of milk to 45 deg. in a close non-conducting box or refrigerator. The box should be lined with tin.

E. E. W., Cherokee Co., Iowa, wishes to know what kinds of Evergreen trees would be best for her to plant for ornament.

ANS.—Cherokee County is well up to the Northwest corner of the State, and only the hardiest Evergreens will endure the severe winter winds. Even White Pine and Norway Spruce are sometimes browned in winter during the first two or three years after being planted out. We would recommend Norway and White Spruce, Austrian, Scotch, Red and White Pines, Red Cedar, American Arbor vitæ and Balsam Fir, as being the hardiest, in fact, about the only hardy Evergreens that can be named. The Colorado Evergreens are the best adapted to that climate, and the most ornamental, but there are few, if any, large enough to plant out.

J. R., Plank Road, N. Y., asks, what is the matter with his hens. Dried matter collects in their eyes, which blinds them and their mouths and throats are filled with foul matter.

ANS.—The disease is probably the roup. One remedy for this disease is to dip a small feather into nitric acid, then thrust it into the nostril of the sick fowl, giving it a twist while in. This should be repeated two or three times a day. Another remedy is to confine the bird in a warm, dry room, and give it a tablespoonful of castor oil every morning for a week. Feed soft food. When the bird is attacked with this disease it should be at once separated from the others.

J. V. B., Cochranton, asks, 1, whether the Gold Brothers, nurserymen, Rochester, N. Y, are reliable. 2. An apple-tree agent traveling thereabouts says the Russian Apple is propagated this year as follows:—The Russion cion is grafted on a wild crab; then dug up; then planted deeper when the cion takes root; then the crab root is cut off, and the plants are worth a dollar apiece, and he asks our opinion on the whole matter.

ANS.—1. We have always heard of the firm alluded to as honorable. 2, Russian apples have been propagated many years. We cannot see that the method as stated is anything else than senseless.

F. S., South Jefferson, N. Y., asks for the dimensions of a movable frame bee-hive.

ANS.—The size of a hive should depend upon the kind of honey to be obtained. If no comb-honey is desired the hive may contain 4,000 cubic inches, but if box-honey is wanted it should not contain over 2,000 cubic inches. If the hive is to be a two-story one, each story should be 18x13 and 12 inches deep, inside measure. If small frames or boxes are to be used above, the hive should be two feet in length.

E. W. K., Glen's Falls, N. Y., asks, 1, whether lightning was ever known to strike a building guarded by a well constructed lightning-rod; 2, what proportion of fruit gardeners make the business a success; 3, where can pure glucose be obtained; 4, where can Gray's Botany be bought.

ANS.—1, We do no not know. The question arises what *is a properly* constructed lightning-rod. 2, We do not understand the question. 3, Any wholesale grocer can furnish it, either direct or through a local retail grocer. 4, At any book store.

O. A. S., Macon City, Mo., had three chestnut trees, two of which have perished, and he asks whether the third can bear fruit by itself; that is, without being fertilized from another tree.

ANS.—Both kinds of flowers (male and female) are borne upon the same tree in the chestnut, so that other chestnut trees near it are not essential. What we call the flowers are the pollen bearing male flowers—slender, feathery catkins. The female flowers are small and inconspicuous.

J. F. B., (address not given) asks, 1, why the people in the District of Columbia do not ballot for President; 2, who in Pennsylvania is agent for the carp-fish and what sort of a vessel is suitable to send to get them in; 3, is the National Wire Company of Chicago reliable.

ANS.—1, the government of D. C. is territorial, and has the same rights and privileges that any territory has; 2, We cannot give the agent's name; 3, It is.

R. M., Oak Burn, N. Y., says that some weeks ago he sent us a paper, and now he asks whether it is a humbug or not.

ANS.—We know nothing of the publication. Papers or parcels of any kind addressed to us, unless the senders' addresses are given or letters of explanation accompany the packages, are often overlooked.

D. B. M., Woodlawn, Neb., asks whether three feet eight inches is too close to plant corn in drills.

ANS.—Whether three feet eight inches will be too close depends entirely upon the distance apart *in* the drills. We should not leave them closer than 18 inches.

H. B. S., Rockport, Ohio, says some insect eats into the buds of the Japan Lily and Lilium Auratum, and wishes to know what it is and what to do with it.

ANS.—We cannot answer positively without seeing specimens of the insect.

J. C. McC., Tidioute, Pa., asks where the Rochester and Tornado Thrashing Machines are manufactured.

ANS.—The old Glen & Hall machine is made somewhere in Canada; but we know nothing of the Tornado.

Name and address lost.—How can I so place three horses abreast as to have the right-hand horse walk in the furrow and still have each horse pull one-third, or the draft equal? Please give diagrams. See answer on page 131.

I. F., Newville, Ohio, asks the Post Office address of the American Naturalist.

ANS.—237 Dock street, Philadelphia, Pa.

J. I. Vansickle, Westtown, N. Y., would like to learn where he can get Toulouse geese.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, FEB. 19.

S. R. M.—T. H. W.—J. R. G.—W. H. C, Williamson Co., Tenn. Thank you for your communication. We were not aware any had been neglected. It *occasionally* happens we receive a greater number of communications than we can print.—C. E. D. W.—B. S.—H. W. R.—E. K. G.—J. B.—A. W., Oneida Co., N. Y., would be pleased to hear from you again.—A. S., Eagle Harbor, thanks.—R. M. L.—E. P. P.—A. B. A.—S. W. J.—O. A. S.—L. A. R.—M. G. H.—J. E. C.—S. S. S.—S. B. P.—O. N. C.—E. B. D., thanks.—D. B. R., thanks.—W. H. O.—H. R. W.—B. P. R.—W.—W. I. H.—R. G.—H. S.—N. R.—S. B. P.—E. C., Texas; we shall endeavor to ascertain.—W. C. B.—O. W. F. The paper alluded to not received. Please send a whole ear with an account of the variety and yield.—W. B.—D. A. B.—G. H. C.—Jno. P. C., Dubuque, Iowa. We can offer no further suggestions as to our corn culture. No, the firm alluded to has not our Blount's Corn.—A. F. M.—E. H.—E. A.—R. H. C.—S. R. M.—E. R.—A. R.—N. F.—G. C. C.—J. E. S.—F. G.—W. F., Jr.—E. A. G.—"Bessie Victor."—I. & A. C.—B. C. M.—A. L. J.—F. D. C.—W. C. B.—S. P.—G. E. N.—J. G.—D. B. P.—D. S. M.—M. N. R.—J. H.—W. P. P.—A. J. U.—E. K. G.—A. R.—J. G. B. P. E. J.—M. F.—J. H. H.—A. S.—G. S. S.—B. P.—C. C. G.—R. B.—E. F.—C. T.—J. G.—D. THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, FEB 26, 1881.

WE CAN still supply Posters, Seed and Plant Supplements, Agents' Outfits, Specimen Copies without charge to all who apply.

We cannot supply back numbers.

The Seed Distribution has been delayed, owing to the fact that the Giant Red Dutch Asparagus seeds have only just been received. We shall now be able to send our subscribers the full distribution *precisely* as originally announced.

M. P. WILDER says in Green's Fruit Grower that if he could have but one of his 800 varieties of pears, it would be the Beurré d' Anjou. Col. Wilder has in effect told us the same thing.

PROF. S. W. JOHNSON, whose opinions are entitled to much respect, tells us that some of the partisans of ensilage say that dried corn-fodder is greatly inferior to a corresponding quantity of the same put down as ensilage. In the total absence of any exact comparative trials, these claims, he says, must be regarded as entirely questionable.

OUR NEXT will be the SMALL FRUIT SPECIAL. We are in hopes it may please as well as the late Special devoted to Hardy Shrubs and Trees. The American News Company were sold out of their usual supply the first day, and we could have sold 1,500 copies in the RURAL office. Unfortunately no extra copies were printed. It is gratifying to know that so lively an interest is taken in hardy plants.

IN conversation with Mr. Parsons respecting our recent notes upon magnolias we find that his experience as between Soulange's and Lenné's Magnolias is t at the former is the hardier of the two. Our own plants grow within a few yards of each other, and without exception Lenné's has stood the Winters better than Soulange's. We may say also that it blooms more freely during the Summer and Fall. But while our experience as to these magnolias is confined to two plants, Mr. Parsons has had the opportunity of observing thousands, and his words should therefore guide our readers.

SUTTON'S MAGNUM BONUM POTATO.—As our readers are aware, this is a new English seedling which has been extensively advertised and, so far as we learn, given very general satisfaction in England. It is now offered in this country, and the few tests that have been made show that, contrary to the rule with English seedling potatoes, it promises to be of some value here as well. The quality of the Magnum Bonum is very good, as we judge from having cooked and eaten a trial quantity of seed sent to us by a friend. The Early Rose, and in fact all potatoes of that class, though flaky without, become waxy within, and this sogginess increases as the potatoes grow old. The Magnum Bonum, though the outside does not crumble or flake off when boiled, is still mealy within and possessed of a richness quite peculiar to itself. We have on the one hand the "strong-flavored" potatoes; on the other the tasteless kinds, well represented by the Alpha, the Early and Late Rose, Snowflake, Early Ohio, etc. We may speak of these as mealy, pure, fine-grained, of excellent quality, etc., but really their excellence, after all, depends upon their mealiness; for they are so nearly destitute of flavor that nobody could determine one from another when cooked. The Magnum Bonum is to us a relief from such tasteless varieties, while its peculiarly rich flavor is not that which can be classed as "strong."

HISTORY REPEATING ITSELF.

THE Chicago Tribune says:—"A corner in the provision market is in progress, which dwarfs any previous manipulation, even the great one of last year. Within a week there have been purchased 25,000,000 pounds of short ribs, 24,000 barrels of pork and 10,000 tierces of lard. The parties interested are mainly the ones who ran the successful deal a year ago, and it is their intention to put prices far above present rates."

How does this differ in reality from a news item of, say, 500 years ago, to the effect that a coalition of robber-barons had been formed to lay the people of some fertile valley under contribution? In those old times the people banded together to resist such raids, and many a bold rider was brought to the ground with pikes made of scythes fastened to poles in the hands of the abused peasantry. Now, however, any attempt at self-protection against these raids of the robber barons of the corn exchange, or the produce exchange, is denounced as "communism," and as an attack upon the liberty (!) of trade. Every honest producer and every honest consumer suffers, and the profit that should have been divided between them goes into the pockets of men who have no higher moral footing than burglars, highwaymen, or train wreckers.

CONCENTRATED MANURES. A QUESTION NOT ANSWERED.

"Do you advise me to use chemical fertilizers on my farm? If so, what kinds?"

We receive this question very often and we regret that no direct answer can be given. Upon some land bone gives immediate and profitable results. On other land it seems to have no effect whatever. The same may be said of potash, nitrogenous fertilizers, lime, salt, plaster, etc. The only advice we can give to our farmers is to try each kind on separate plots, and combinations of the several kinds on other plots. In this way some indication may be obtained as to whether special or combined fertilizers are needed. Land may be infertile because it needs one or all of the elements of plant food. When, therefore, phosphoric acid fails to produce appreciable results this is not positive proof that the land does not need bone. If potash should fail, this is not positive proof that potash is not needed. The land may be exhausted of both potash and phosphoric acid, in which case, though either may fail when used separately, the use of both may be attended with entire success. Farm yard manure, if plentifully used, never fails because it supplies all the food that plants need, but not in the relative quantities which they need. An accumulation, therefore, of certain food constituents and the insufficiency of others may result from its long-continued use, which inequality may be remedied by the use of *special* concentrated fertilizers if we did but know what constituent was most needed. In this case, the test of each separately should be best calculated to answer the question. It has happened in the experience of almost every farmer that certain strips, or pieces, of land sowed to oats, wheat or rye, that have received special manures, accidentally as it were, without any special object in view, have produced crops far ahead of any other parts of the field. Here we have a trustworthy hint as to what the land most needs, and our suggestion as to test-plots is precisely of the same character. Commercial fertilizer establishments furnish special manures, such as potash, nitrogen, phosphoric acid—or "complete" manures, which are supposed to supply all of the food which a given crop needs. That is, they approximate the composition of farm manures, only that they supply the food more nearly in the proportionate quantities which, according to analyses, such plants require. Whether, supplied in this way, they are as assimilable, or whether, so to speak, plants fatten upon them as readily as when their food is placed before them in the form of farm manures, we cannot say. All should remember that we are still in our infancy as regards the use and value of concentrated fertilizers, and whether in any given case they may be profitably used or not is, with our present information, a problem that every farmer must solve for himself.

FARMERS AND MERCHANTS.

AT the time of the "Grange Movement," some eight years ago, the commercial class was disposed to regard the action of the farmers as antagonistic to themselves, and to side with the transportation interest. This was no doubt due to the protest against an excess of "middlemen," which was made by the farmers. But even the commercial journals now speak of the elimination of all unnecessary intermediaries as essential to successful commerce. The fact is that the interests of all the industrial classes, the commercial not less than the mechanical and agricultural, are substantially the same. The protest by the latter against supernumerary middlemen was simply a phase of the demand for labor-saving machinery, and the simplification of all industrial processes and methods. It is just as necessary to the progress of America, that all extra middlemen should be thrown out, as it is that the extra hands in the factory and on the farm should be eliminated by improved machinery and implements. The merchants, as a body, now recognize this truth.

But they go further than that. They have taken up the action against excessive rates and favoritism on the part of transportation corporations where the farmers dropped it (if they may be said to have dropped it at all), and are pushing it with the enterprise and vigor which their greater command of capital and better opportunities of effective co-operation give them. And they also meet the proofs of their coming success in the puerile epithet of "communist" which they threw at the farmer, and which the railroad men now throw at them.

The same homogeneity of interest which is now admitted to exist between the commercial and the producing classes will eventually (and before long, we trust) be seen to exist between them and the transportation interest. It is not for the advantage of any business man or corporation, in the long run, to cheat, abuse, or in any way wrong his or its customers. It is only because so many railway corporations are now under the management of ignorant, incompetent and short-sighted men that the public complaint is so loud against them. These men, like incompetent shipmasters, will soon demonstrate the folly of their methods, and be succeeded by those who will have sense to see that justice and honesty are the best and only policy for them; that any attempt on the part of institutions like theirs, so hopelessly in the grip of the people, and so subject to the resistless sweep of popular authority, can only be made profitable, in the long run, by treating all with whom they have to deal with the strictest equity. If this demand for equity, whether on the part of farmers or other business classes, is "communism," then communism is destined to be the law of the land, for equity the people will have.

SAVING AND SPENDING.

THE accumulated wealth of a nation is the sum of its savings. This may be in the shape of money, lands, cattle or any property which costs money or labor, or which is the direct increase of such property. If a person saves out of his income a hundred dollars and keeps it in any form of permanent property, it remains as wealth, and may be used to increase itself. But the moment the hundred dollars is expended in destructible property, that is, such as may wear out or does not reproduce itself, it begins to vanish and finally disappears. For instance, if the hundred dollars be spent for costly clothes, a carriage or a driving horse, a hunting dog or a cask of wine, it is evident that it immediately begins to wear away, to depreciate in value, or to be used up; and it is only a question of time how long, or soon, before it will come to an end. But if a cow, a workhorse, or a piece of land is purchased, or the money or its representative is spent to reclaim a marsh; to drain useless land; or to erect a building; it at once becomes reproductive, remains intact, and earns interest for its use, or it wastes but slowly, and in the wasting or wearing of it, it not only replaces itself, perhaps many times, but gives continual profit for its use. So far as money or labor is used for the latter class of purposes, it is not spent, but is saved. It is also saved and remains or reappears as wealth, when it is used for any necessary purpose, as the production or purchase of food and clothing, suitable for its owner's business; or for tools, or anything which will enable him to work to replace it. It is spent and disappears as property or wealth, when it is used for purposes of luxury or waste of any kind, giving no valuable return for its use, notwithstanding it may have been paid out as wages for laborers or artisans.

A million dollars have been squandered and have disappeared in villainous smoke and deafening noise in celebration of the Fourth of July. That money, so far as it represents labor, has gone out of existence, and is totally wasted. The money itself remains, it has gone to China perhaps, to pay for a year's labor of many men who have been making fireworks, and these have spent it for food and clothes, while they have been at work; but they have nothing to show for their labor; what has come in has gone out; and so with those who earned the money with which the fireworks were purchased, and all and every person engaged in the business of making and procuring them. This is a typical case and there are many others of which this is a type. A person, family, or nation, is wealthy or poor as it saves or spends; and if we will only look into the secret causes of many cases of poverty which are just now causes of complaint, we should find there has been too much spending; and on the contrary, those cases in which a person or family stands in better circumstances than before, will be found to have resulted from a habit of saving. Extravagance is without excuse. There is no true enjoyment in wasting anything, nor in squandering the proceeds of former work in idleness; nor in working hard for a time, that an opportunity may be secured of going on a debauch. That is a cynical and a vicious, although old, adage, "let us eat and drink for to-morrow we die;" it is repeated in fewer words in the modern, "a merry life and a short one." The true philosophy is to use our time and our opportunities that we may increase the true happiness of not only ourselves, but of those about us, and that we may leave the world when we have done with it, better off than it was when we entered it, and inherited the fruits of the labor of others who had preceded us in the same virtuous efforts. And this can only be effected by industry and a well regulated economy which is neither niggardliness nor wastefulness.

BREVITIES.

THE next RURAL will be the Special Small Fruit Number.

THE attention of our readers is called to our Report on the Golden Ovoid Mangels on page 131.

THE Japan Persimmon. The RURAL was sharply censured for giving its opinion that it would not prove hardy in the North. It is not always pleasant to be the first to condemn new and lauded plants, let the condemnation be ever so well merited. But there is a satisfaction about it in the long run.

WE have received several complaints from our subscribers that the ring sent out with subscriptions to the Saturday Evening Post, of Philadelphia, Pa., and warranted to be gold, is *not* gold. One ring, which is certainly not gold, has been sent to us as proof. We had supposed the establishment in every way trustworthy, or we should have declined their advertisement.

FROM present appearances, among the numerous sins of omission which should bring well-merited rebuke on the present Congress, will be its culpable failure to pass a bill for the suppression and restriction of pleuro-pneumonia among cattle. The urgency of this measure has been amply demonstrated in and out of Congress, but while day after day has been wasted by this body in futile wrangling over mere political questions of no practical interest to the people, this matter of vital importance to the greatest interest of the nation has been shamefully neglected. Last Friday, the passage of the Cattle Diseases Bill establishing a Bureau of Animal Industry, etc., was strongly urged in the Senate by Mr. Johnson, of Virginia. Mr. Coke, of Texas, and others; but its provisions met with bitter objections from Mr. Ingalls, on the ground that the bill was a conflicting, incoherent medley and jumble of provisions every one of which, in his judgment, was directly at war with the rights of the States. It is chiefly out of an excess of regard for State rights that the present Democratic Congress has hitherto failed to pass a satisfactory bill in this connection, and as it has only another week to live, it is hardly likely that it will in its last moments remedy the wrong it has hitherto neglected. Well, the farmers of the country will have little reason to regret the end of a Congress which has been so atrociously negligent of their welfare.

A COMMITTEE of prominent California grain merchants lately requested the managers of the Pacific railroads to state the lowest price at which they would transport not less than 150,000 tons of wheat overland to New York City. As lately stated here, the rates of freight on the Pacific Coast for shipment of grain round Cape Horn are so high as to leave no margin of profit to the producers, and even at such excessive rates the tonnage facilities are far too small to meet the demand. It was therefore thought that the railroads might be able to name a figure for overland transportation, which would at least enable the wheat growers to escape a loss on the crops. The railroads, however, it is said, fixed the overland freight on grain at 60 cents per bushel, or about $20 per long ton. As the market for California wheat is in Europe, the cost of transporting it across the Atlantic would have to be added to the above charge, which would raise the total freight to a figure which would leave no profit to the producer. But in addition to the obstacle of cost, neither the Central nor Union Pacific Railroads could engage in such an immense traffic. Both roads are single tracks with switches at long intervals—a circumstance productive of much delay in the ordinary business of the roads; but if each day from 10 to 20 wheat trains were started eastward from California, confusion would be endless, unless both roads built double tracks along their entire lines. Again, neither company possesses a tithe of the rolling stock which so enormous a grain business would demand, and it would not pay connecting roads to send empty cars to California to come back full. With inadequate tonnage even at exorbitant rates of freight, and no immediate possibility of finding a railroad outlet to market for their crops, the plight of California wheat raisers is not an enviable one, however heavy may have been their harvest.

Literary Miscellany.

THE FARMER'S WOOING.

The daisies nodded in the grass, the buttercups were sleeping,
And just across the river sang the farmers at their reaping;
Upon the hills so blue and far, the maple leaves were showing
Their soft white beauty in the breeze that from the sea was blowing.
A little maid came through the lane, with song and rippling laughter;
The buttercups made way for her, the daisies nodded after.

A strong, young farmer saw her pause beside the parting river;
She drew a lily from its depths, with golden heart a-quiver.
"Thou art more fair than lilies are," said he with head uplifted,
And threw a poppy, as the stream toward the maiden drifted.
She set the flowers in her hair, the red and white together;
A cloud grew black before the sun and rainy was the weather,
He came across the river then, the farmer from his mowing;
He minded not the water's depth, he cared not for its flowing.
"O Love!" said he, "if gleaming sun and cloudless skies o'erlean us,
The river's barring width may roll unpassed, untried, between us;
But when loud thunder fills the air, and clouds and rain come over,
I'll cross the ocean to your side—I am no fair day lover!"

And so one day the village bells rang out across the river.
Their music set the buttercups and daisies all a-quiver,
While some one drew a lily from the stream so blithely flowing,
And plucked a blood-red poppy that amid the wheat was growing;
The maiden set them in her hair, the red and white together,
With many a smile, a tear or two, and glances at the weather.

They passed beneath the chapel's side, the farmer and the maiden,
Where arches crossed above their heads, with snowy blossoms laden,
And in that place of holy calm the binding words were spoken;
He in his heart bore out the truth, she on her head the token,
The years went by, and some were bright and some were clouded over,
But ever stood he at her side—he was no fair day lover.

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

(Concluded from page 91.)

CHAPTER IV.

THE INDULGENCE OF A HABIT WHICH CAUSES UNPLEASANT RESULTS.

Having gleaned the papers to my satisfaction, or rather dissatisfaction, I resolved upon a ramble through the town. From the force of habit I felt about me for a cigar, as I was about starting forth, and to my great delight I fished one up out of the depths of a hitherto neglected pocket. I lighted it, and stepped out on the street.

So many novel and interesting sights at once met my gaze, that I naturally stepped back into the doorway of the hotel to view them more deliberately. There was quite a crowd moving to and fro along the street, magnificent looking men and women all. On the crowded thoroughfare of the city I naturally supposed that all classes and conditions of its people would be represented, and my surprise was therefore great at the uniformity in appearance of the passing crowd. I saw none who were either flashily or shabbily dressed, none who were either oppressed with obesity or angular with leanness, none upon whom disease, poverty or misfortune of any kind had set a mark. On the contrary, they seemed all to belong to the well-to-do class of society; the men were tall, broad-shouldered, deep-chested, dignified and majestic in carriage. Of the women, it is enough to say that they possessed the beauty of form and feature; the graceful and energetic mien which is conferred by vigorous health and a pure, well-balanced, and well-cultured mind. But that which most attracted my attention and interested me in this people, was the intelligence and the nobility of mind which was clearly written in their faces. From my intuitive sense of the relation which exists between the outer form and the inner soul, I would have placed unlimited confidence in the honor, justice and integrity of any one of them. Anything mean, unkind, ungenerous, or unjust seemed utterly incapable of finding a harboring place in such noble looking specimens of our race.

I have spoken in this manner of this people before, but the reader, I hope, will pardon this repetition, as there is nothing which makes such a powerful impression upon us as an individual in whom all the elements of our physical and mental natures are completely and harmoniously developed.

What opinion these people formed of me as I stood leaning against the side of the doorway, and puffing away at my cigar with a self-complacent air, I could only conjecture from their manner. It was clear that they regarded me as a curiosity for they all gazed upon me as they passed with a look in which surprise was most prominently expressed. I also observed that they whispered to one another as they looked at me, and I supposed that they were making comments on my dress and personal appearance; for there was a great contrast between me and them in both these particulars. But I afterward learned that that which more than anything else made me an object of curious interest to them was the puffs of tobacco smoke which I was continually emitting from my mouth. This came out through an old man whose appearance indicated second childhood and decrepitude, who stepped aside from the crowd and approached me.

"I beg pardon," said he, in a broken voice, and with a fatuous expression of countenance, "but I have a great curiosity to know why you are making a chimney of your mouth."

My first impulse was to resent this impertinent speech by a contemptuous silence, but this old man being the only person whom I had seen whose condition was such as to excite my pity, I thought I could afford to treat his impertinence with civility, so I replied, that I was simply indulging in a habit very common in my country.

"And what do you do it for?" said he, "that is, what good purpose does it subserve?"

"I confess, sir," I replied, "that I cannot tell what good purpose it really does subserve. It is a habit, sir, merely a habit."

"A habit!" he repeated," merely a habit! and does not promote any good! It must be a very pleasant habit, then," said he, "will you allow me to try it?"

I was becoming disgusted with the old man, and I gave him my cigar, which was now reduced to a stump in the hope of getting rid of him. He put it in his mouth and inhaled deeply; but knowing nothing of the art of smoking, he allowed the smoke to penetrate cavities which were never designed for it by nature, and the result was a violent fit of coughing and wheezing which I verily thought would have a fatal ending. The tears rolled down his cheeks, and in his violent efforts to catch his breath, he would have fallen to the pavement had not a bystander caught him in his arms. He was supported into the hotel and laid upon a sofa quite pale and exhausted.

I was naturally looked to for an explanation of the affair, so I gave the facts as I have recorded them, to the crowd which the event had called around me. One of them had rescued the cigar stump from the street and when I referred to it, he held it up to the gaze of the crowd, who seemed to regard it as a remarkable curiosity.

The papers of the next day all contained accounts of the affair and I was referred to in them as the peculiar looking stranger who had the strange faculty, and who seemed to enjoy the operation of burning a disagreeable substance in his mouth, and emitting a smoke which was nauseating in the extreme. One of them also contained an historical account from a learned professor of the habit of tobacco using as practiced in an age long past,

"I have not seen this stranger," the professor observed in the course of the article, "but from the description of him by those who have, he seems to be an exact prototype of the people of this age. In what region of the earth can he have lingered out the intervening centuries. How is it that he now appears among us like a fossil of an almost forgotten age!"

These notices served to make me more than ever an object of curiosity. I would fain have been less so. Indeed I adopted the peculiar dress of the country with the view of making myself less conspicuous; but the inferiority of my personal appearance could not be disguised. I would not have admitted to any inferiority in this particular among my own people, but here it made me a marked character wherever I went.

But to return to the old gentleman. Being well stricken in years, the shock to his system was a severe one, but after an hour's rest, he had recovered sufficiently to be driven in a carriage to his home. I expressed my great regret. To the young man who had been summoned to the aid of the old gentleman, and who I understood was his great grand-child, at being the innocent cause of so much discomfort to his ancestor, and I would have shown my sense of self-reproach to that ancestor, also, by rendering him any service which lay in my power. But if I had been an ogre breathing forth fire and smoke, he could not have shown greater uneasiness at my presence, so that I found the greatest service I could render him was to depart from him altogether.

The gentleman who had gotten possession of the cigar stump gave it as a special favor to the hotel clerk, and that individual had a neat casket with a glass cover constructed for it, in which it was carefully deposited, to be looked upon by the people of Goodwilltomen, and the stranger from near and far, as a relic of a long past age.

CHAPTER V.

PHILLEGOMOTERS.

The excitement growing out of the innocent indulgence of my favorite habit, having subsided, I again set out on my tour of observation.

As I was passing out of the door my eye caught a glimpse of a great object flying by, about fifteen feet above the pavement, with a speed which was astonishing, but with scarcely any more noise than the whirr which naturally attended its rapid clearage of the air. I stepped quickly to the sidewalk, but when my eye next rested on this flying object it was several blocks away, and decreasing in size with a rapidity which I could scarcely believe was owing to the increase of distance.

As I gazed after it, another object on the other side of the street caught my attention which seemed to grow as rapidly as the first was diminishing. As it approached nearer, I surmised from its appearance that it must be a sort of rapid transit for long distance passengers. It bore some resemblance to a long car with a great rubber oblong bag forming its roof. It did not appear to have any wheels, but there were windows in it which allowed me to perceive that it was filled with passengers. It went by like a flash, and as it passed I observed what appeared like a great whirling disk at its hind end, which I took to be the source of its motion. I marveled that anything of this character, going with such speed, should make so little noise; but then its speed itself was a marvel, and that it should slide along so rapidly without steam or wheels was also marvelous and that people of ordinary prudence should entrust themselves to such a hair lifting means of locomotive—even to look upon—exceeded anything which I had ever yet observed in the line of the wonderful.

I stepped to the edge of the sidewalk to look at the tracks of these flying machines. They were supported on iron pillars, something like the elevated railroads of my own country, and so light were they in construction that they appeared to me like the work of some crack-brained engineer, under the control of a rascally board of directors. The iron pillars were about twenty feet apart, and consisted of a single post, with two, branching arms. These arms supported by four six-inch strips of oak, which formed the bed for the iron rails. These were bolted on the outside of the oaken strips, which, by the way, were set up edgewise upon the arms of the pillars. They were about three inches wide by an inch and a half thick, and they had a deep groove on the under side of which, was bright and smooth as polished steel. As I stood wondering at this peculiarity of construction, and thinking what could be its purpose, another car approaching, attracted my attention. It moved on a different track—and here I may observe that there were four elevated tracks along the street, two upon the left side for cars going up, and two upon the right for those going in the opposite direction. The inside tracks were for long distance passengers, while the outside tracks, or those next the sidewalks, carried cars which stopped at every cross-street. It was this latter kind of conveyance which now approached. It was much smaller, and moved much slower than that which I had first observed. When it reached the cross-street below me, it halted, and scarcely had it come to a full stop, when down it went to the sidewalk with a suddenness which took my breath away, and made me for the moment think that I was to be the witness of a catastrophe. Several passengers stepped to the sidewalk, and others who had been waiting for the car stepped on, when it rose to the level of the track almost as suddenly as it had descended, and was off again with scarcely a minute's delay in the whole proceeding.

With the purpose of gaining an idea of the principle of the locomotion of this public conveyance, I stood earnestly watching its approach, when the rattle of a carriage, and the exclamation: "In to the sidewalk there, Hero!" diverted my attention, and the next moment a most superb horse, with arching neck, majestic step, and a countenance which spoke at once of courage, intelligence, and docility, halted before me. He was neither guided nor restrained by bit or rein, his only harness being a girdle to support the thills and hold back the carriage, and a breast-collar by which to draw it. This fact conjoined with the superior qualities of the animal, so completely riveted my attention that I failed to notice the occupant of the carriage till he bade me a cheery good morning. Then I observed that it was my acquaintance of the previous evening who had been so attentive to me in the park.

"Come, sir," said he, in a pleasant, familiar manner, "jump in, and let me show you something of the city."

I looked at the horse, and then significantly at his master. "I judge you to be a person of extensive experience," said I, "and old enough to have a full measure of prudence, but before entrusting myself to that bitless and bridleless steed, I would like to ask what assurance you can give me that he will not run away with us, and break our bones, or dash out our brains in his mad career."

"The most satisfactory assurance, sir, that the most timid could require," he replied. "I have ridden behind horses in this manner for a hundred years or more, and this particular one for fifteen, and still my bones are all sound, and my brain still completely fills my cranium. If you ask further assurance, I will say that it is the common practice in this country to drive horses without a bit or bridle, and yet, during the whole course of my life, I have never heard of one running away."

At this juncture one of the rapid-transit machines came whirring along, and I instinctively jumped back several paces to be beyond the reach of danger from its lightning speed. This movement was greeted with a hearty laugh from my acquaintance.

"I hope, sir, you are not afflicted with a morbid cautiousness," said he.

"Is it an evidence of morbid cautiousness," I asked, "to get out of the range of such a lightning apparatus? Suppose it should leave the track and come down to the pavement; I would not like to be under it, would you?"

"There is not the least danger of it leaving the track," said he, "or coming down to the pavement if it did leave the track."

"I suppose, then," said I, ironically, "if it were disconnected from the track, it would take to the air like a bird and go sailing away over the housetops, bearing its unterrified passengers gleefully along with it till it should have an opportunity of landing them safely in some vacant lot, where the heads of pedestrians would not be endangered."

"That is just exactly what it would do," he replied. "But come, sir, let me prevail upon you to get into my carriage, and we will talk this matter over as we ride along."

Several turnouts having passed by while we were talking, with horses unguided by bit or rein, I was encouraged to accept my friend's invitation.

"I hope, sir," I remarked on entering the carriage, "that you will remember that I am as great a stranger to your customs and institutions as though I had just arrived from another world, and that you will make due allowance for the peculiarities which I may display. I feel the humility, the ignorance and the littleness of a child in the presence of your wonderful people and your marvels of progress in art, science, manners, etc., of which, I suppose, I have yet gained only a most crude and incomplete idea. I would like to have you talk to me as you would to a child, and allow me to ask all the childish questions I like. Now, in the first place, my curiosity is at a keen edge to know all about these machines, or whatever you may call them, for carrying passengers."

To be continued.

MAGAZINES FOR FEBRUARY.

Harper's Magazine.—Contents: The Gospel History in Italian Painting: Asleep, a Poem; The English Lakes and their Genii, III.; Pottery in the United States; The Old New York Volunteer Fire Department, II.; Literary and Social Boston; Anne, a Novel; The Fire-fly, a Story; The Early History of Charles James Fox; Puss Tanner's Defense, a Story; A Laodicean, Book the First—George Somerset; Editor's Easy Chair; Editor's Literary Record; Editor's Historical Record; Editor's Drawer.

Paintings in the Catacombs.—The earliest works of Christian art in Italy are the wall-paintings in the Catacombs. At first these were merely abstract symbols, the Labarum, the Alpha and Omega, the fish, used as the sign for the name of Christ. Then more pictorial emblems were painted: the dove, representing the Christian soul freed from the body; the peacock or phœnix, type of immortality; the sheep, signifying the soul in the earthly life. This last emblem stands in immediate connection with the earliest representations of Christ as the Good Shepherd. This is the favorite subject of the Catacomb paintings. He is depicted as a beautiful youth in shepherd's dress carrying a lamb on his shoulders, or leaning on his staff in the midst of a flock, or playing on a shepherd's pipe, while the sheep listen to him. The idea of these pictures is certainly Biblical; but the artistic form is supposed to be taken from an old Greek statue of Mercury carrying a kid, which existed at Tanagra. For it must be observed with regard to the art of the early Church that once having gained the right to exist, it adopted without hesitation materials and forms which had been invented by the heathen. Proceeding on the principle that what God hath cleansed man may not call unclean, the Christians repeated in their religious pictures the type of face, the methods of expression, the artistic mannerisms, which are found in the wall-paintings of Herculaneum and Pompeii. They personified the sun and the moon, the earth and the sea, mountains and rivers. They even adopted heathen myths. In a beautiful painting from the ceiling of the tomb of S. Domitilla, Christ is represented in the character of Orpheus playing upon his lyre, while trees bend toward him, and wild beasts gather at his feet. Mingled with these symbols and allegories we find the first beginnings of sacred historical painting.

The spirit of all these pictures is purely symbolical. They do not depict, they simply suggest, their subjects. They presuppose in the mind of the beholder the knowledge of a certain event which they shall recall to him by a mystic sign for his comfort and encouragement. For this is the aim and temper of the Catacomb paintings: to strengthen and console. They pass by the passion and death of the Lord, to dwell upon the themes of gladness and consolation—resurrection, miracle, deliverance, hope. They are joyful and confident. They are flowers blossoming in darkness, stunted, delicate, imperfect, but full of a marvelous brightness an unextinguishable life.—Henry J. Van Dyke, Jr., in Harper's Magazine for February.

St. Nicholas.—Contents: Frontispiece; In the Tower—A. D. 1554, Poem, Thorwald and the Star-Children; Poor Jack-in-the Box—Jingle. Illustration: "Jack Speaks for Himself;" Winter and Summer, Poem. The Giant Squid; Cousin Charley's Story; Two Visions of Fairy-land, Poem; Mystery in a Mansion, Chapters VII. and VIII.; My Little Valentine, Verses; The Goose and the Nightingale, Illustrations by J. G. Francis: "The Entertainment;" In Nature's Wonderland, Chapter IV.; Johnny's Answer, Verses; How Jube Waked the Elephant; "There was a Small Maid of St. Paul," Jingle; The Peterkins Talk of Going to Egypt; The St. Nicholas Treasure-Box of Literature—The Skeleton in Armor; The Stage Coach; The True Story of the Obelisk; Which? Verses; Phæton Rogers, Chapters V. and VI.; For Very Little Folk—The Tame Crow; Jack-in-the-Pulpit; The Letter-Box; The Riddle-Box.

The Obelisk.—The work of moving the monolith through the streets was the most interesting of all. On level ground it traveled about as fast as a boy can walk, and often made six hundred feet in a day. The engine pulled easily and without jarring or straining, and, when not at work dragging itself and its load, helped the men to move the timbers in relaying the timbers as fast as it went over them. The Frenchman was a year in moving his block four hundred feet and turning it around once. The American took it nine thousand eight hundred feet and went around four sharp corners, besides eleven turns of from twelve to forty-seven degrees. The way this was done was most curious. When the stone came to a corner of the street it was run upon a curved railway, built in a half-circle. A ring of channel-bars and cannon-balls was placed on the ground, with a large hydraulic-jack in the center. Beyond it were two more curved rails, describing a quarter-circle. When the locomotive ran out on these tracks, the hydraulic-jack came under the lower end of the stone, and the engine rested on the outer quarter-circle. A rope was put out to a stake on the side of the road, and with a gentle pull the whole affair swung around the corner with the greatest ease. The hydraulic-jack here assisted to lift the end and take off the weight, and thus make a pivot on which the stone might swing around.

By the time you read this the work will be finished, and the great monolith will stand once more on its bronze crabs on its ancient pedestal. The full length of the obelisk is sixty-nine feet and two inches. This includes the point, or as it is called, the pyramidion, which is seven feet eight and one-

half inches high. At the base, just above the broken portion, the stone is ninety-two and three-quarter inches thick, and at the top, at the edge of the pyrimidion, it is sixty-three inches thick. The pedestal on which it will stand is eighty-three and three-quarter inches high, and its weight is ninety-eight thousand pounds, the obelisk itself weighing four hundred and thirty-eight thousand five hundred pounds. When finally set up, the entire monument, including the steps and pedestal, will be just eighty-one feet high. It must be the happiest stone of all, for it stands under a clear, blue sky, much like its old Egyptian sky, and it rests in peace among green fields and pleasant gardens. A stream of carriages passes close beside it under the trees, and happy children look up at its strange picture-letters, and wonder what it thinks of its final home in a land of which its old Egyptian master never so much as dreamed.—St. Nicholas for February.

ATLANTIC MONTHLY.—Contents: Friends, A duet IV., V.: The Wives of Poets; Night on the Ocklawaha; The Future of American Shipping; In the Cerlosa; The Portrait of a Lady, XV.-XVIII; German Cooperative Credit-Unions; Who are the Aryans? Reminiscences of Washington, X. The Taylor Administration, 1849-50; The Wizard Poet; In London again; Is Anything Lost? Dexter's Congregationalism; Recent Volumes of Short Stories; The Spell-bound Fiddler; Les Deux Masques of Saint-Victor; Mr. Tilton's Pictures; The Contributor's Club; Books of the month.

GERMAN COOPERATIVE CREDIT-UNIONS. — No healthy social science ever came before the public with plans which were to render labor, energy, and mental exertion unnecessary. Even if it were possible, no sound political economy would desire to make the struggle for existence less earnest. Social reforms, however, have the object of dividing material goods—and the spiritual ones to which the first serve as a necessary basis—more in proportion to useful intellectual and physical labor performed, and less in accordance to inheritance, privilege, and class; of easing the contest for the means of subsistence in some places, and giving it a better prospect of success; of rendering it really earnest in others.

Such is the aim of the credit-unions, founded and managed by a warm-hearted humanitarian for the purpose of elevating the moral and material welfare of entire classes of society. They are not charitable institutions. On the contrary, one main object is to render laborers and tradesmen independent; to give them such a consciousness of their own dignity as men, as shall make them scorn charity. Their watch-word is "self-help;" the principle upon which they are based is "that man has received from nature not only wants, but also powers, the proper use of which gives him the means of satisfying his wants." Schulze-Delitzsch comes repeatedly back to this fundamental proposition, and is unable to value too highly a manly self-reliance. "We wish no aid from the state," cries he, "we desire no public subventions! Let us alone. Give us freedom and the liberty of managing our own affairs, and we ask no further assistance." Schulze-Delitzsch does not decry generosity and the doctrine of human "brotherhood." These are noble principles of our nature, and useful in relieving individual cases of distress. He contends, nevertheless, that where classes of the people are concerned, charity, whether public or private, is powerless. Instead of strengthening, it weakens; instead of elevating the character of the recipients of its benefits, it debases it. Cooperative associations, rightly understood, have a far weightier mission than that of relieving dependent poverty, namely, that of preventing it.—Richard T. Ely in Atlantic for February.

APPLETONS' JOURNAL. Contents:—The Veterans of Yesterday. In Three Parts. Part Second. From the French of Erckmann-Chatrian; Rambles among Books. I. Country Books; Parliamentary Anecdotes; Buddhists and Buddhism in Burmah; The Irish Land Question; Shakespeare's Traducers; A Lady's Wanderings in Japan; Music. A Deadly Feud. A Sketch. From the German of Rudolph Lindau; Decorative Decorations; Romances of Ancient Egypt; The Photophone; A Strange Story: Love in Dreams. A Poem; Editor's Table; Notes for Readers.

THE assertion so frequently made, that skill in handicrafts has declined and is declining, seems to be almost universally accepted as true. Ruskin has said so again and again: hosts of other critics have echoed the charge; it is a favorite theory with virtuosos and connoisseurs, who love nothing without a touch of antiquity; and innumerable writers assume off-hand that what all these people so confidently affirm must not be questioned. What, now, if a little cursory investigation should bring us to accept this general indictment with some small measure of reservation?

In all comparisons between workmanship of the present with that of the past, the work of to-day suffers greatly by one, perhaps unavoidable, circumstance—which is, that the selected work of bygone time, that which has survived, that which has made reputation in the midst of much inferior performance, is invariably made the standard by which the average of current work is measured. Out of the past there comes down to us, for the most part, only the best work, or it is only by the best work that judgment is formed. And it is the accumulation of this superior work, covering long periods and coming from many lands, that creates the vivid impression we have of ancient skill. Many splendid buildings and great paintings, many immortal books and admirable specimens of handicraft, have come down to us, but long intervals have sometimes elapsed between them, much inferior work has been altogether overlooked and forgotten; it is like a distant landscape in which we see only the hill-tops that seem to stand piled together, unconscious or ignorant of the level plains that intervene. It is therefore necessary in comparing any kind of performance of to-day with that of the past, to select only the very best, to pass altogether by the mass of cheap and temporary productions, and confine ourselves to those things which confessedly employ our best skill.—Appletons' for February.

THE AMERICAN NATURALIST.—Incomplete Adaptation as Illustrated by the History of Sex in Plants: A Partial Biography of the Green Lizard; A New Leaf Cutting Ant; Comparative Neurology [Continued]; The Bee's Tongue and Glands Connected with It; History of the Buffalo; Editors' Table; Recent Literature; General Notes—Botany, Zoology, Entomology, Anthropology, Geology and Paleontology; Geography and Travels; Microscopy; Scientific News; Proceedings of Scientific Societies; Selected Articles in Scientific Serials.

A PARTIAL BIOGRAPHY OF THE GREEN LIZARD. The green lizard (*Anolis principalis*) of the Southern United States is sometimes called the American chameleon, but it is not related to the chameleon of the Old World.

Its changeable coat, however, gives it a popular right to the name. Two specimens of Anolis that I have kept for months in a wire-cloth cage have shown some interesting habits.

The female came from South Carolina in November, 1879, in good condition, but with the greater part of the tail wanting. She was placed in a small cage and supplied with flies, but refused to eat. During the Winter the cage stood among house plants, in a room heated by a furnace, and although she was lively and ran around a good deal, she ignored the flies. Thus she remained without food and water (except an occasional drop that fell by accident when the plants were watered) for four or five months.

But when the warm Spring days came, she greedily devoured the flies, and when water was sprinkled in the cage, she eagerly lapped it up with her tongue. It is said that the Old World chameleons drink in the same manner. She would not notice water that was in a small jar in the cage, although very thirsty.

Sometimes when I approach the cage she lifts her head and opens her mouth. I do not know whether she is conscious of asking for water, but I soon recognized this an indication of thirst. In April a new tail began to show itself, looking like a small black wart, and since then it has grown nearly an inch. At first it was distinct and looked like a graft on the other portion, but now, after several moultings, it is continuous, although it can be easily distinguished from the rest; the scales are smaller, it always remains darker than the rest of the body.—Sarah P. Monks in American Naturalist.

LIPPINCOTT'S MAGAZINE for February is the second number of the new series, and gives most satisfactory evidence of the improvements promised at the time of the change. Down the Red River of the North, by Alice Ilgenfritz, is a sprightly and profusely illustrated sketch of a trip through the province of Manitoba, a section of our continent that has attracted considerable attention of late. In A Celestial Colony a graphic description is given by C. Baldwin of that part of San Francisco known as Chinatown, with an account of the life of its Chinese inhabitants. The interest of the paper is enhanced by several very good illustrations. Fiction is attractively and liberally represented by the serial "Lilith," which is continued with increasing interest, and three capital short stories, viz,, Monsieur Paul's Heroism, by Louise S. Houghton; The Kourasoffs, by Vera Lapoukhyn; and A Midwinter Romance, by L. K. Black.

The more solid articles of the number—although none can be called heavy—are an analytical description of Welsh Women, by Wirt Sikes; a discussion, under the title of Power-Centres, by an old journalist, of the various types of journals, and the why and the wherefore of their existence; an able criticism of Sarah Bernhardt in her various characters, by M. G. Van Rensselaer; and "Among the Cherokees," an account of that prominent tribe, with observations made during a visit, by A. M. Williams. A bright sketch entitled A Country Tavern in Winter, by Mary Dean, two striking poems, with the usual variety of Monthly Gossip and literary criticisms, form the balance of a choice number of this justly popular magazine.

SCRIBNER'S MONTHLY.—Contents: An Old Virginia Town; Men and Spiders; John La Farge; The Silence of the Hills; His Footsteps; Notes of a Walker; Foreign Actors on the American Stage; Thackeray's Relations to English Society; Peter the Great as Ruler and Reformer; Souvenir of Italy; The Fair Barbarian; The Music of Niagara; Aunt 'Cinda Ranch; Completeness; Garrison Life at Governor's Island, New York Harbor; The Heart of a Rose; Norway's Constitutional Struggle; How the New Testament Came Down to Us; Some Quacks; Agricultural Experiment Stations; Topics of the Time; Communications; Home and Society; Culture and Progress; The World's Works; Bric-a-Brac.

The articles, as usual, are of an interesting character. One on "Experiment Stations" includes in its descriptions that of the experiment farm belonging to the RURAL NEW-YORKER.

NEW PUBLICATIONS.

Reminiscences of Dr. Spurzheim and George Combe. A Review of the Science of Phrenology from the Time of its Discovery by Dr. Gall, to the Time of the Visit of George Combe to the United States, in 1838-40, with a new Portrait of Spurzheim. By Nahum Capen, L. L. D., New York: Fowler & Wells, Publishers. 1 vol. 12 mo, extra cloth. Price $1.50

While the title of this new and seasonable work is sufficiently full to give the reader an impression of its general character, it should be said that the author, Dr. Capen, was himself a personal friend and confidential assistant and adviser of the great advocate of Phrenology during his visit to this country. Being well versed in the history of Phrenology, from its earliest introduction to American science, and a gentleman of wide learning, Dr. Capen is peculiarly qualified to prepare such a work, and by so doing, has aided greatly toward completing our biographical data touching the great apostles of Phrenology; especially Drs. Gall, Spurzheim, and Andrew Combe, and George Combe, the last being generally acknowledged one of the most eminent men in modern literature. While "Reminiscences" does not purport to be a treatise on mental science, it so clearly and candidly discusses the questions naturally arising in its course, in the relation of the brain to the mind, and the philosophy of human character, that it is a very instructive volume aside from its biographical specialty.

On the Threshold.—By T. T. MUNGER. 16-mo. Boston: Houghton, Mifflin & Co., publishers. Price, $1.00.

To a young man on the threshold of life, and to those even more advanced in years, this work is particularly adapted. We know of no other publication that is so full of sensible, judicious, sympathetic, helpful talks to young people, and the agreeable and tactful style of the author creates at once the feeling of a warm friend and wise counselor. No young man about to embark in life's great enterprises should fail to read it. It will be of great use to such, and may be the guiding element to their future destiny.

The book is divided into nine sections, viz.. Purpose, Friends and Companions, Manners, Thrift, Self-reliance and Courage, Health, Reading, Amusements, Faith, each subject of which is sympathetically and frankly discussed, and stimulates the reader with the idea that life is worth living for. It should be in every household, and we predict for it an immense sale.

How to Live in Winter. By Mrs. AMELIA LEWIS. New York: Food and Health Publishing Co. Price, 25 cents.

This little book is published in pamphlet form. It treats of "Our subjection to temperature and the influence of the cold season on life;" what food will best maintain the vital heat of the human body in the cold season;" "The management of dwellings in the cold season;" "The management of dress in the cold season;" "Winter diseases and health measures." These subjects necessarily engross our attention, and should receive greater consideration. In these times of cheap and good publications, little excuse can be made for dearth of information. This one of the many, supplies this want.

The Minor Arts: By Charles G. Leland. London: Macmillan & Co.

"Porcelain Painting," "Wood-Carving," "Stenciling, Modeling," "Mosaic Work," &c., are the particular features considered in this little work on decorative art. Its design is to instruct in these various methods. The minor arts are now resorted to in a remunerative sense to a much larger extent than formerly; consequently while imparting information and pleasure to the mere lover of art, the author has satisfied a two-fold need. The illustrations are good; the descriptions clearly drawn and as a whole, this treatise is worthy of notice.

For Women.

CONDUCTED BY MISS RAY CLARK.

CONCERNING BREATHING AND CLOTHING.

MARY WAGER-FISHER.

A LADY who had suffered from pleurisy, which malady had left her lungs with adhesions at the back and otherwise disabled, went to a skillful physician for advice. After he had examined her lungs and listened to her breathing, he said:—"You don't know *how to breathe*. The first thing that you are to do is to breathe to the *bottom of your lungs with every breath* you draw. You can, if you will, cure your lungs by breathing properly; your digestion will be improved, too. Drink four quarts of milk a day, and eat salt codfish three or four times a week. Soak the fish in *salt* water, then cook it in the usual way with cream or milk." That was the gist of the prescription to the woman who was generally debilitated, and who greatly improved under the treatment. As milk, without salt, has a constipating tendency, the salt fish was probably recommended to counteract the effect of so large a milk diet, and also for its tonic properties. Loose as she thought she wore her clothing, she soon found that it was altogether too tight for full, deep breathing.

The great thing that the patient needed was to breathe properly, and the doctor's comment is applicable to a great many people, and especially to women, whose clothing is very apt to compress the waist.

I do not suppose that any womankind who reads the RURAL, deliberately and consciously laces her waist, for to do so is intensely vulgar—inexcusably vulgar. But I suspect that there are many who unconsciously wear clothing that is much too tight. If one can breathe so as to fill every part of her lungs without difficulty, she may rest assured that her clothing is loose enough. Full-chested women are rare. Aside from the good health secured by having a full, deep chest, it is also a very great beauty. It adds dignity and grace to the form, to the carriage of it, and to the agreeableness of the voice. The size of the waist is a matter of very small consequence, and, as a rule, it is always in proportion to the rest of the body if it is allowed to grow and develop naturally. It is not an uncommon thing to hear women remark, "My waist measured 16 or 18 inches when I was married, or when I was twenty years old," as though the small circumference of it was equivalent to some marked virtue, as the possession of courage, or a fine accomplishment. The *chest* measure *is* a matter of some consequence, while the other is not.

A matter which seriously interferes with young people of both sexes forming an erect, full-chested figure is the wearing of high heels on the shoes. I never see a young person trying to walk on such stilts without a feeling of pity for the ignorance that allows it, and the ignorance that endures it.

For growing girls, high heels are diabolical. I use the word advisedly. The mischief they do is almost incalculable. There is no excuse, but dwarfness for high heels. The bootmaker will make heels of any size you order, and if you buy boots ready made, he will cut off the heels to suit your idea. Be sure too, that you have a shoe *broad* at the toe. Narrow toes are not comfortable, and happily they are no longer fashionable. To keep growing feet straight along the line of the great toe, and all the toes free and uncramped, is a most essential thing. To cramp and distort the feet, is to store up a vast amount of discomfort and suffering for the future, as well as for the present.

How to dress the body with comfort, and gracefully too, is always a serious question with women. I wish to tell you how one woman whom I know, dresses herself, and she always has an appearance of marked trimness and style. To begin with, in the Winter, she wears woven underwear just as a man does—the drawers reach to the ankle and the stockings are drawn up over them. The next garment is of canton flannel cut to fit the figure like a basque with the skirt reaching well over the knees. This buttons up the front, is high at the neck and with long sleeves. Over her knit flannel under drawers she wears drawers of canton flannel. The long skirt of the basque serves for under petticoat, and is trimmed around the bottom. These articles, with the addition of a very light felt, flannel or merino skirt, constitutes her underclothing. It is warm, entirely comfortable and light to carry. The skirt of her frock is never suspended about her waist. It is cut as nearly like a Princess, or Gabrielle frock, without sleeves, as can well be: but the part that constitutes the waist, from six inches below the waist line up, is usually of Silesia, or muslin, so that there is quite an economy in the dress fabric. The style, is much the same as if an ordinary dress skirt should be sewed to the bottom of the lining of a short round basque in a smooth, flat seam. Of course, this gives added warmth to the body, and over this the basque or "body" of the frock fits with a nicety not to be experienced in the old style of dressing with the full chemise in a pucker around the waist, while the skirt and the waist never part company. Every part of the body is well protected, and what is a great point, the warmth is equally distributed.

For Summer, the same style is carried out in materials of lighter texture, muslin being substituted for flannel ones, while for Spring and Fall there are intermediate suits. All in all, it is the best suit for women that I know of, and there is no patent upon it. It dispenses with the chemise and corset cover, and the corset too, for that matter, if you wish to do without it. It is capable of modifications to suit the wearer, or the style of dress to be worn; it can be cut square in the neck or short in the sleeve; may be made of flannel in lieu of canton flannel and ornamented *ad libitum*. I earnestly recommend the style to all women readers of the RURAL, feeling confident that when once they have adopted it they will be charmed with its adaptability and comfort. The seams of the long under basque, or basquine, should be made quite flat.

In making aprons, you will find that one width of wide goods, like gingham, muslin or linen, will make a good-sized apron, if you cut it with but one seam, and that run straight down through the middle. Measure off the length of the apron—it should reach to the bottom of your frock—and if you have no more material take a strip an inch and a half wide off one side for strings and binding. Then fold the gingham diagonally the long way, so that the width at one end will be twice as much as at the other, and rather more if the apron is as long as the frock. See that the two wide ends, at opposite ends of the fabric, are of equal width, and then cut along the diagonal fold. Put the light ends together and sew the bias edges together with a straight strip of muslin held in the sewing to stay the seam. Round out the top or small end to fit the waist smoothly, and trim the bottom suitably at the seam. You will have a smoothly-fitting apron that will please you well, and with little trouble in the making. For a garden or sewing apron, a large square piece sewed flat on the front forms a very convenient pocket.

A child's table, or eating apron, if lined on the under side of the front with a thick piece of drilling or canton flannel, cut like a bib, will prevent liquids and liquid food from soiling the frock beneath.

WOMEN'S GOSSIPS.

E. L. T.

IT appears to be a settled belief with every masculine observer that whenever two or three women meet, the result is sure to be a stream of aimless, purposeless talk, usually given the name of gossip; a collection of idle chit-chat, only to be found among women.

Why women should gossip more than men seems to be unknown and unexplained, except by the hypothesis of mental inferiority. I think it could be better accounted for on the ground of defective education. The man has his business to engross his thoughts; it brings him into contact with many men and many minds. And then he has man's prime consoler, the newspaper, to freshen his thoughts and ideas. It is a lamentable fact, that few women—that is, few in comparison with men—read the newspapers. It has been said that the papers, especially those given to too much interviewing, encourage a gossiping disposition, by their trivial details about persons and things, but in such a case, it ceases to be gossip, according to the common acceptance of the term; it does not consist of mere frivolous personal items.

The thoughts of one occupied in the regular routine of household work are apt to run in a certain groove; she is "cumbered with many cares," and her conversation very naturally consists of what is called gossip. The average housekeeper has no time for a regular course of reading, but surely the tendency to gossip would be greatly

lessened by light reading. Her culture might be superficial, but it would be a decided benefit. After all, I think the more thoroughly women are educated the less likely they are to indulge in such supposed weakness of the sex as gossip.

BANKING UP CELLARS.

SEEING this subject brought up, I thought I would tell how we managed ours.

The cellar wall is built double from the surface till it reaches below the line of frost. The outside wall is of stone and the inside is lathed and plastered, leaving a space of a few inches between the walls. The house is high enough from the top of the ground to admit of the cellar windows being placed on a level with the surface, and that admits of a large amount of light and air. As the windows are double, Jack Frost has never found an entrance, and during daylight it is never necessary to have a light to go to the cellar. We have never been obliged to bank up the house to keep the cellar warm. For ventilation, one of the chimneys is built from the bottom of the cellar, with an opening near the bottom to clear it out when necessary, and one large enough towards the floor to admit a stovepipe, if desired, proves an efficient and agreeable mode of carrying off bad odors arising from vegetables, while an outside cellar door secures fresh air when needed. The double windows are made with only one frame, with the glass put on the outside and inside of the sash. This answers the purpose as well as two frames.

AUNT RACHEL.

ABOUT WOMEN.

MME. GERSTER sends all the flowers that are given her on the stage to the hospitals.

MLLE. BERNHARDT'S first night in Philadelphia is said to have been a great social success. One of the most fashionable audiences ever assembled in that city was present.

MISS E. E. BURLEY, of Swanzey, N. H., has been invited by the Universalists of Hinsdale to preach for them.

MRS. MATTIE R. FIELD of the editorial staff of the New Orleans Times, is a rising woman journalist. Mrs. Field is young, enthusiastic, and a great favorite in New Orleans.

MISS PARLOA, in Boston, has cooking classes, which are attended on the one hand by fashionable and well-to-do people, and on the other, she has a free class among the very poor and ignorant, and is doing excellent service and supplying a great need.

MISS ANNA DICKINSON is at present a guest at the "Continental" in Philadelphia. She will soon return to the stage and her *rentree* is contemplated as a brilliant event in dramatic circles.

MISS AGNES PITMAN the daughter of Professor Benn Pitman of Cincinnati, prepares at her own home a Christmas tree for poor children every year. This year she had over one hundred of these "little ones" whom she had personally visited and invited.

MRS. LIVERMORE has recently lectured before the Unity Club in Cincinnati, with great success and the Commercial says:—"The impresston she always leaves is one so good and wholesome that it is to be hoped she may return for many a year to delight and instruct her hearers."

THE great writer whom the world has admired and revered as George Eliot, is no more. Those who had the privilege of her friendship will feel that not only is a great writer lost to the world, but a lofty, a magnanimous, and an inspiring character. In truth, artist though she was, those who knew her were well aware how the best qualities of her work sprang from the reality and depth of her interest in human life.

FASHIONS.

THE most fashionable bridal dresses are of white satin, trimmed with brocaded satin or velvet.

Ingenious girls can make their own muffs and collars by sewing guinea feathers on to silk and lining them with down and satin.

Short jackets of the gayest plaid, with hoods lined with some quiet dark color, are among the novelties.

Fans are now painted and made of brocade to match the dress.

White pine-apple silk handkerchiefs, embroidered in gold, are worn around the neck.

The old-fashioned thread lace veils that, fifteen years ago were so popular, are now utilized by being worn as collarettes around the neck.

Woolen dresses are ornamented with embroidery in crewels, or with floss in crewel-stitch. Young ladies who are adepts in this art can make very pretty costumes, as the embroidery does not need to be very fine.

Costumes of shepherd's plaid, trimmed with black velvet, are very fashionable abroad for walking dresses for morning wear. A jacket of corduroy is worn with them, showing a glint of red either in the lining of the hood or collar.

Transparent French mull is greatly used for handkerchiefs, and these are trimmed with fine lace. Drawn work, or tied work, is the most elegant novelty in handkerchief decoration. The monogram now is very small, and worked in floss silk. Yellow-white French lawn is much used for handkerchiefs.

Chenille flowers and foliage are very fashionable; they are used for coiffures and the trimming of bonnets, and are especially pretty and effective in the hair.

Black net veils with polka dots of chenille are worn in the street. The medium dots are better for wear, being more comfortable and becoming.

Buckles and clasps for belts are again seen among the fancy jewels of the day, for belts are worn not only with round-waisted, but also with basque bodices.

Young and feeble mothers with frail children will both become strong by the use of Hop Bitters.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

JESSIE SEABRIGHT'S SCRAP JOURNAL.

MAY MAPLE.

Nov. 18, 18—. While I was finishing a suit of garments for baby Alicia to-day, my thoughts wandered away to other times and other places. Suddenly they seemed to come to a full stop, as I put some tiny buttons upon a little underwaist, and then off they went—my thoughts, not the buttons—to a time, years ago, when a young mother made me a visit. She brought with her a baby boy some three or four months old; a great healthy looking fellow, with cheeks like velvet and great blue eyes as bright as stars. But he had not been in the house ten minutes before he began to fret and cry, and for two hours there was no peace with the child. The mother walked the floor with him, tossed him up and down, rocked him, trotted him, offered him milk, offered him water, talked to him, sang to him, and pitied him, but all to no purpose. And this was his habit almost every afternoon, after he had taken his bath.

I thought it was a strange freak for an apparently healthy child, but as the child for a long time refused to come to me, I could only pity him and his mother. But at last he reached out his plump little arms, showing his willingness to accept the proffered care of a stranger.

My very first impression upon handling the little bundle of humanity was that its waistbands were too tight for comfort, and I began at once to take out the pins which fastened his clothing. *Every band unclosed with a snap.* The mystery of his afternoon crying was at once solved. All the morning the child was left to kick and roll about as he pleased in a warm double-gown, and he was as happy as a Summer song bird. After dinner he was dressed for the day, and his skirts were fastened about his waist tight enough to stay in place, which would have been all very well if little Harry had been stuffed with sawdust like a big china doll. As he chanced to have a strong pair of lungs, he tried his best to make known his discomfort.

The remainder of the day the child was left with his clothes loose enough to suit his own notions of comfort, and there was no more trouble with a crying baby. We then concluded that shoulder straps and loosely buttoned waists were better for the little ones.

Instead of straps for Alicia I cut waists with arm-holes. I never put pins in her skirts or dresses, neither did I make her "long clothes" unnecessarily long. The consequences are, she is unusually playful, and is a real joy to all in the house.

HOW TO INTEREST AND AMUSE THE LITTLE ONES.

ANNIE L. JACK.

Oh! these snowy days of shut-up country life, when little restless feet cannot go out-of-doors for drift and driving storm. It is a time that every mother of small children knows, and many are the devices to keep down noise and yet have a spirit of contentment among the little ones. I found great trouble with one little girl when brushing and combing her hair until I adopted the plan of letting her play with the pins in the toilet pin-cushion, bidding her make a letter of the alphabet, and then another, until a word was spelled, and by that time the tangles were all smoothed. Ironing with a cold-handled sad-iron is very fascinating work, and a small box turned sidewise and made into a doll-house is an amusement in which children of both sexes can participate. Little Three-year-old likes a box of sand, or, better still, a lot of blocks from the work-shop with which to build houses, so early do they learn to imitate grown-up children. If given a lead pencil and sheet of paper many a child is perfectly happy and quiet, while this may not have any charm for another. If well wrapped up, there is nothing so health-giving as a run out-of-doors, and if the children of a household have each some special department of the stables to attend to, it will inculcate habits of regularity and attention and prove a good discipline. Even little children can, except in severe weather, feed fowls and in the sunny part of the Winter's day look after the domestic animals of their household.

DOMESTIC RECIPES.

Sponge Cake.

Three eggs well beaten, one and one-half cup of powdered sugar, one cup of flour, one-half cup of water, two teaspoonfuls of baking powder. Flavor to taste.

Orange Cake.

Two cups of white sugar, one small half cup of butter, five eggs, whites of four only, one-half cup of cold water, two cups of flour, two teaspoonfuls of baking powder, juice and rind of one orange. Bake in layers. Make a frosting of the white of an egg, powdered sugar and juice of an orange.

Syrup for Cakes, etc.

Five pounds of "C" sugar, one quart of cold water, white of one egg. Stir the egg into the sugar, pour in the water and stir all together. Let boil up, then skim off the top. Let boil up then skim off the top. Boil again and take from the fire.

Orange Pudding.

Peel and slice oranges until you have about a quart, put into a deep pudding-dish and cover with a half cup of white sugar. Set a pail containing a pint of new milk into a kettle of boiling water. Stir together the yelks of two eggs, one-half cup of sugar, two tablespoonfuls of corn-starch and a little cold milk. When the milk boils, stir in this mixture adding a pinch of salt. Let thicken and pour over the oranges. Beat the whites of two eggs to a stiff froth and add a tablespoonful of powdered sugar. Spread over the top of the pudding and set in the oven just long enough to brown. Any fruit can be substituted for the oranges.

MRS. B. DRAKE.

Savoy Pudding.

Three-fourth pounds crumbled *stale* sponge cake, one pint cream, yolks of six eggs, whites of two beaten well, a lemon rind rubbed down on loaf sugar, (one-fourth pound) a little salt. Serve hot after baking, with a sauce made of six tablespoonfuls of sugar, ten of water, four of butter, two of rose water. Heat and mix well and then color pink.

Fine Icing.

Whites of five eggs, one pound of pulverized white sugar. Beat well, I may say extra well. If a flavor is desired add three spoonfuls of orange or lemon juice, but plain icing is much the more delicate.

Fish Sauce.

One-fourth pound flour, one and a half pint of milk, two ounces of butter, salt and pepper to taste. Cook twenty minutes and throw in some chopped green parsley leaves when just done.

Velvet Pudding.

Beat the whites and yelks of six eggs separately. Sift one-half pound of wheat flour, make a smooth batter with milk, stir in the yelks and a little salt, then the remainder of *the* quart of milk, a large spoonful of brandy and the whites beaten to a stiff froth. Bake half an hour in a buttered pan. Serve with a brandy sauce, colored with a little Cochin eal. I know of no pudding more delicate and appropriate after a hearty dinner.

Apple Charlotte.

Mix two pounds of sour rich apples, one pound of sugar, juice of three lemons, rind of one grated. Boil two hours then turn into a mold till cool. Serve with plain cream.

Welsh Rarebit.

One-half pound of old cheese, one-half tea cup of butter, two teaspoonfuls good mustard. Heat in a pan, stir till melted and mixed well. Spread it thickly over toasted bread and serve hot.

CHIEF COOK.

Grease from Silk.

To remove grease-spots from silk dresses, ribbons, etc., rub softly with pieces of freshly-cut, stale bread—each piece absorbs a part of the grease until all is extracted.

Home-made Lemon Extract.

To three ounces of the thin yellow peel, allow one pint of good alcohol. Keep in a bottle tightly corked. Shake frequently every day for a week, then strain the liquid from the peel and it is ready for use.

Keeping Lemons.

Lemons may be kept fresh for many weeks by keeping them in a vessel of cold water. Change the water two or three times a week and keep in a cool place. Housekeepers who use many lemons, will do well to purchase them while cheap and keep them in this way.

MARY B.

QUESTIONS ANSWERED.

To Preserve Eggs.

New Subscriber asks for a pickle for preserving eggs. We can but republish directions given on page 303 in RURAL of May 8, 1880. Pack on end, cover with salt lime water and keep in a cool place. Proportions—a pound of stone lime and a pint of salt to two gallons of pure water. Be sure that the eggs are perfectly fresh, also be careful not to crack the shells.

Plain Suet Pudding.

Please give directions for a cheap suet pudding? A. B.

ANS.—Two large cups of sifted flour, two teaspoontuls of yeast powder sifted with the flour, one cupful of minced suet, two well beaten eggs, a little salt and a pint of milk. Pour the mixture into a greased mold, or tin pail set into a kettle of hot water and boil constantly for two hours. Eat with sweetened and flavored cream or a liquid sauce.

A timely use of Hop Bitters will keep a whole family in robust health a year with but little cost.

Miscellaneous.

News of the Week.

HOME NEWS.

MONDAY, Feb. 21, 1881.

Cincinnati, the center of the Union! Boston, the "Hub," will probably denounce the census system and the Census Superintendent and every one else! Gen. Walker thinks that the center of population will fall near Cincinnati. Ten years ago it was 48 miles east of that city, and the growth of the South has drawn the central point a little farther southward.

Right on the heels of the recent floods and river overflows of the late mild weather, comes the report of serious snow storms in the North-West. In some places on the plains two or three families move into a house and burn the vacated building for fuel. Traveling for fuel or anything else is quite out of the question where snow is four feet deep on the level and from 20 to 30 feet deep in drifts. One valley 20 miles long and on average 60 feet deep, was drifted entirely full of snow. A passenger train was stuck for two weeks in a drift, the passengers sleeping in the cars and foraging for food in the farm-houses near by. No trains arrived at, or departed from, Council Bluffs, Iowa, for two days; in fact all traffic was at a stand still. Similar reports come from all the principal North-west cities, while the smaller towns are, for the time, without communication with any place. But there's one consolation, the first gentle Spring month (according to the almanac) is near at hand, then these poor people may be able to "dig out."

The desire, expressed on our editorial page last week, that speedy means would be taken to investigate the adulteration of food, has already been met. The House Committee on Epidemic Diseases have reported a bill authorizing a commission of three experts to inquire into the adulteration of food in the United States. Now let the State Legislatures take the matter in hand.

Hon. Fernando Wood, member of Congress from this State, died at Hot Springs, Arkansas, on the 13th inst. He was born in Philadelphia in 1812. In 1840, when 28 years old he was elected to the 27th Congress in which he was an earnest advocate of the Morse Electric Telegraph bill. After his term expired he retired from politics until 1850, when he became a candidate for Mayor of New York, but did not receive the election. However, he was elected to that office in 1854, and again in 1858. Mr. Wood re-entered Congress in 1862 and has been there ever since. Four years ago he was appointed chairman of the Ways and Means Committee, and he held the position until his death.

S. L Allen and Co's. works in Philadelphia, have been destroyed by fire, but they announce that they will be able to fill all orders for Seed Drills promptly, and will be delayed but a short time on Hoes and Cultivators

[Potlstown Daily Ledger.]

A Michigan journal relates the following: Amos James, Esq., proprietor of the Huron House, Port Huron, Mich, suffered so badly with Rheumatism that he was unable to raise his arm for three months. Five bottles of St. Jacobs Oil cured him entirely.

FOREIGN NEWS.

IN the House of Commons, Chaplin, Conservative member from Lincolnshire, gave notice that he would move, February 22, to prohibit the importation of cattle from countries where disease is known to exist, as their slaughter on landing has proved insufficient.

The interviews between Mr. Goshen, British Ambassador to Turkey, and Prince Bismarck, have rendered it evident that an agreement has been arrived at by the Powers on a common policy aiming at the attainment of a compromise between Turkey and Greece.

The Mersey Steel and Iron Company, limited, of Liverpool has gone into liquidation. Its liabilities are £338,000. The assets, consisting principally of stock, premises and machinery, are considerable. The losses amounted to £38,000 during the last seven months.

At a dinner which he gave to Mr. Parnell, Victor Hugo pledged himself to write an appeal to the world in favor of Ireland, similar to that which he published in favor of Poland. It will probably appear next week. Mr. Parnell says, regarding the movement in America, "Although it is of great importance and capable of immense development, it depends entirely upon the stand made in Ireland. If we are worthy the occasion here the American people and the Irish nation in America will give us proportionate sympathy and practical help. If the spirit and courage of our people at home be maintained, the resources of the whole Irish race abroad will be at our disposal; while, if there is the slightest flinching or reaction in Ireland, it will produce disastrous results in America." Mr. Dillon has been requested to take Mr. Davitt's place as Chief Organizer, and has accepted the position. It was decided to begin a strong agitation among English workingmen and the agricultural classes in favor of important social reforms.

[Atchinson Champion.]

No Benefit.

An Indiana newspaper, thus writes: Mr. Geo. F. Helderle, of Peru, Ind., says that he has suffered very much with rheumatism and used many remedies without benefit. He found the desired effect in St. Jacobs Oil.

AGRICULTURAL NEWS.

Mr. Sampson of Storm Lake, Iowa, is building a creamery at that place which will cost $12,000 when finished, and will have the capacity to use the milk of 10,000 cows.....A Farmers' Club was recently organized at Hudson, N. Y., under encouraging circumstances. This is the second club of which Columbia County can boast. The first being located at Chatham, N. Y., of which Geo. T. Powell, Agricultural Editor of the *Courier* is President. We are glad that farmers are coming to realize the value of these organizations.....In 1879 Illinois produced one-fifth of all the corn grown in the United States, and, according to the latest advices, the crop of 1880 will bear about the same proportion to the corn crop of the country. The average yield per acre during the past season was 33 bushels, and in 21 years this has been exceeded only eight times, the average in 1862 being 40. The present corn crop of 251,000,000 bushels has been exceeded only three times—in 1875, 580,000,000; 1877, 270,000,000, and in 1879, 306,000,000. The profits on wheat have of late years increased the wheat acreage at the expense of corn. The average price in past years has been exceeded only twice in 21 years. The value of the hogs marketed in 1880 was $22,137,000; in 1879 it was $16,640,000. The value of cattle in 1880 was $17,026,000; in 1879 it was $16,751,000.....The State Board of Agriculture met on the 16th inst, in the Statehouse at Trenton, N. J. An address was read by T. T. Kinney, of Newark, on the advances made in agriculture. Professor Cook gave an account of the success met with in the experiment station. Dr. Hunt gave a valuable paper on pleuro-pneumonia. Gov. Ludlow was elected President and all of the old officers were re-elected.

The exports of hog product continue on a large scale, and show a further gain over corresponding time last year, and since the 1st of November, the movement of meats, including barreled pork, has reached 257,000,000 pounds, or 46,000,000 pounds increase over same time last year, and lard exports have reached 104,000,000 pounds, or 18,000,000 pounds more than last year, the aggregate of product amounting to 361,000,000 pounds, against 297,000,000 pounds last year, an increase of 64,000,000 pounds, equivalent to the product of about 350,000 hogs.

The Chinese and Japanese, it is said, excel all other nationalities in the culture of early vegetables. This arises from the fact that they use only liquid manures, hence the growth of the plants is most rapid, and as a natural consequence the vegetables are very brittle and tender. Lettuce and radishes they force rapidly, giving the plants a sprinkling once a day. Tobacco and tea plants are also treated in like manner.

During the session of the farmers' institute held at Maquoketa, Iowa, Jan., 26, 27, and 28, the following statement was made: "One car load of butter will bring to the producer as much money at 30c. per pound, in New York, as fifteen car loads of wheat at $1.20 per bushel, or thirty car loads of corn at 60c. or six car loads of cattle or hogs at 5c. per pound in New York,"

At the Minnesota Cane Growers' meeting held last week at Minneapolis a request was made of members that they furnish the Secretary the amount of syrup they had made during the season; it footed up 115,816 gallons. They have on hand 14,600 gallons. This amount of syrup, had the season been favorable, would have made, at six pounds to the gallon, nearly 700,000 pounds of sugar or 345 tons.

The steamship Lord Clive, which arrived at Philadelphia on Wednesday last, had on board 32 head of Jersey and Guernsey cattle and 44 improved Hampshire Down sheep, consigned to Messrs A. M. Herkness & Co. The British Queen, which arrived two days previously, brought over 13 head of Jerseys, consigned to Messrs A. M, Herkness &Co.; and 45 head of Guernseys, consigned to S. C. Kent, West Grove, Chester county. Taken as a lot, the cattle are probably the finest that have ever been imported to America. Dr. F. Bridge, V. S., examined the stock and found them free from contagious diseases, but under the law they will be compelled to be quarantined 90 days before they can be sold. The Hampshire Down sheep will be sold at the Bazaar, Ninth and Sansom streets, on the 1st of March.....The elevators at St. Louis are busy loading barges with wheat and corn for foreign shipment via New Orleans. From 300,000 to 400,000 bushels will be sent out early this week and more will follow.

Thousands of ladies to-day cherish grateful remembrances of the help derived from the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. It positively cures all female complaints. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

Cleanse and moisten the dry sticky mouth of patients and refresh them with Hop Bitters diluted with cool water.

Try "Sun-Sun Chop Tea," a sample or package. It is a fine rich black tea with flavor of green. The offer is reliable. Imported only by the Great American Tea Company. [Send postage stamps.] Box, 4235. See advertisement.

Premature Loss of the Hair

May be entirely prevented by the use of BURNETT'S COCOAINE.

HOUSEKEEPERS should insist upon obtaining **Burnett's Flavoring Extracts,** they are the best.

The Markets.

SPECIAL FROM THE CHIEF CENTRES.

Until Saturday, Feb. 19.

Chicago.—FLOUR quiet but steady. WHEAT fairly active and a shade higher; No. 2 Chicago Spring, 980. bid, cash; 98½c. March; 99½c. April; $1.02⅝ May; No. 3 do. 87@90½c. Clover-seed quiet; No. 2 mammoth, $4 70; old prime $4 75, No. 2, $4 60; old do, $4 50. At the Close—WHEAT firmer; No 3 Red, February, held at $1 07¾. $1 07½ bid; sales May, at $1 09¼. CORN steady; No 2, March, 42½c; May held at 44¾c, 44½c. bid. Receipts and shipments none.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 19, 1880.

BEANS AND PEAS.—The strong tone of last week's bean market has developed into a supported advance. The best feeling is in white sorts, but even red kids and other recently neglected items are held with a better grip. The demand is light at the new prices, but receipts are not expected to prove oppressive. Green peas in small supply and firm at $1.70@1.75; Southern B. E. peas a shade better; quoted $2@2.10 ₩ 2-bush bag.

Marrow beans prime $2.05@2.10, do. other $1.90@2.00, medium prime $2.05@2.10, do other $1.90@2 pea $1.90@2.10, while kidney $1.90@2.10, red do, prime $1.50@1.60, do. other $1.30@1.45, black or turtle soup $1.40, Lima $4.50@5.

BUTTER.—The market has ruled steady for all fine and fairly useful table stock. For local average use, State meets the most regular business for daily wants. Large parcels are not active though some fine dairies are still kept entire regardless of the inattention of wholesale buyers. Common Western butter loses much of its natural Winter demand owing to the loss of confidence in quality. Quotations for Western have been ruling at points which have prompted miscellaneous shipments, and cable items have arrived here which exhibit a mixed character of stock. Even quality is one of the great helps to sales. Many invoices are not only irregular but have the disadvantage of adulteration.

Creamery choice Western, 31@ good to prime, 31@33c; fair to good 28@30c. State and early made, 2 @30c.; dairies, entire choice, 29c; good to prime, 23@24c.; other, 19@22c.; firkins, 15@24c.; Welsh tubs, fancy, 25@26c; good to prime 23@24c; other 16@22c; pails and half tubs choice, 27@29c.; good to prime 25@26c; other, 16@22c.; Western imitation creamery, 28@27c.; dairy, fresh, 25@26c; other 16@24c; factory, 23@24c.; other 16@22c.; rolls, 17@19c.

CHEESE.—The market has not varied, showing a moderate amount of trade and steady prices. Quotations

State factory, fancy, at 13½@13¾c.; do, good and prime, 12¾@13¼c.; do. fair, at 11½@12c.; do. half skimmed, 10@11c.; Wisconsin factory, fine, at 13¾@13¾c.; do. good to prime, 12¾@13c.; do. fair to good, 11¾@12¾c.; Ohio factory, fine, 13c.; do. good to prime, 12@12½c.; do. flat, fair to good, 11@12c.; do. poor to fair 8@11c.

Receipts for week, 25 874 boxes.
Exports for week, 22,120 boxes.
Liverpool cable, 63s.
Steam to Gt. Britain, 30s.@40s.

COTTON—Demand fairly active and the market closed at, for

February, 11.37c.; March, 11.48@11.49c.; April, 11.64@11.65c.; May, 11.78@11.79c.; June, 11.89@11.90c.; July, 11.98@11.99c.; August, 12.03@12.04c.; September, 11.58

LIVE STOCK MARKETS

NEW YORK, Saturday Feb. 19, 1880.

BEEVES.—Receipts for the week 11,542 head; do. last week, 9,409 do. During the week over 100 carloads have gone direct to two wholesale slaughtering firms. The market closes weak, hardly holding Wednesday's figures: Dry cows sold at 3½@4c. live weight: Cherokees and Texans, 8¼@9¼c. to dress 56@57 lbs.; poor to good native steers, 8¾@10¾c to dress 56@57 lbs.; prime cattle, 11@11¾c. to dress 57 lbs.

VEAL CALVES.—Supplies light; all ruling high.

Live calves, fed choice 8,8¼@9c.; fair to prime 7¾@8; poor, 6@7c.; Mt Holly 5@6c.; buttermilk, 4@4¾c. grassers, 3c; hog-dressed, choice 11¼@12c.; prime, 11@11¼c.; fair to good, 7¾@10¾c.; poor, 7@8c.

COWS AND CALVES.—With light supplies the market is firm for car-load styles of stock at $37@55 per head: prime singles for private use, $60.

SHEEP AND LAMBS.—Receipts for week, 23,636 head; do. last week, 22, 342 do. With the late decline in wool butchers tried to obtain concessions: this made a dragging trade and many sheep were carried over. Sheep quoted 6¾@7¾c; lambs 6¾@7¾c. A few spring lambs quoted at $9 per head.

SWINE.—Receipts for the week, 22,796 head; do. last week, 32,844 do. Live and dressed have ruled high during the week but close in buyers' favor.

Live hogs, corn 6¾@6¾c, country dressed pork, light, 8¼@9c, medium, 8¼@8¾c, heavy, 7¾@8c.; city dressed Western 8@8¼c. Pork tenderloins 12@12¾c.

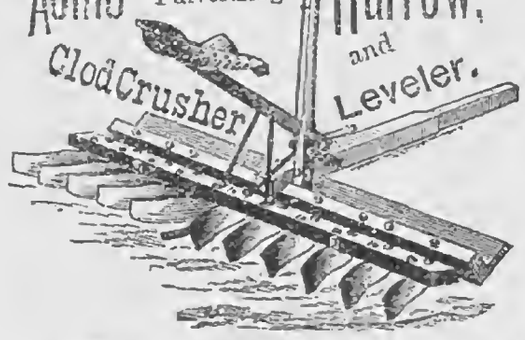
The standard of America

Admitted by leading Seedsmen and Market Gardeners everywhere to be the most perfect and reliable Drill in use. Send for circular. Manufactured only by

EVERETT & SMALL, Boston, Mass.

$350 A MONTH—AGENTS WANTED—75 best selling articles in the World; 1 sample *free*. Address JAY BRONSON, Detroit, Mich.

"Acme" Pulverizing Harrow, Clod Crusher and Leveler.



The *"ACME"* subjects the soil to the action of a *Crusher* and *Leveler*, and at the same time to the *Cutting, Lifting, Turning* process of double rows of

Steel Coulters

the peculiar shape and arrangement of which gives *immense cutting power*. The *entire absence of Spikes or Spring Teeth* avoids pulling up and scattering of rubbish. It is *especially adapted* to inverted sod, hard clay and "slough land" where other Harrows utterly fail, and also works perfectly on light soil. Send for circular.

NASH & BROTHER, Sole Manufacturers, HARRISBURG, Penn. and 22 COLLEGE PLACE, NEW YORK CITY.

A THING OF BEAUTY

We have just received the first five thousand of an immense order, given some time ago and paid for in advance, of an

ELEGANT WORK OF ART,

designed by one of the best artists living, and executed in a superior manner in fifteen colors, on the finest white card-board; each color blends with the others in perfect harmony, and is not laid on in daubs. This elegant work of art consists of a centre piece containing THE LORD'S PRAYER, encircled by a beautiful wreath of flowers, outside of which are TEN beautiful tinted engravings, with mottoes, illustrating the TEN COMMANDMENTS. The size of this magnificent work is 16x24 inches, and it will be presented **FREE of all charges** to any person sending SIXTY CENTS for one year's subscription to **OUR HOME.** OUR HOME is a large thirty-two page monthly magazine filled to overflowing with Stories, Sketches, Poems, Fashions, Music, Social Amusements, etc., etc., now in its second year. To increase its circulation we make the above liberal offer, and guarantee **three times value** of money sent. Copies of this elegant work can be seen at our office. Specimen copies of OUR HOME sent free on receipt of stamp. Ten copies of the paper and ten premiums sent by express on receipt of Five Dollars. Postage stamps taken. We refer to any publisher in this city. Address THE LILLEY PUBLISHING COMPANY, No. 7 MURRAY STREET, NEW YORK CITY.

IS A JOY FOREVER!

THE CROWNING OFFER!

THREE VALUABLE PERIODICALS FOR THE PRICE OF ONE, AND FIVE SPLENDID PREMIUMS FREE

Wishing to introduce our world-famous literary and household periodicals into thousands of new homes where they are not already taken, we make the following grand, unprecedented offer: Upon receipt of **Only One Dollar,** (which is the regular price of *The Fireside at Home* alone and *twelve cents* extra to pay postage on the premiums, we will send **The Fireside at Home, The People's Home Journal,** and **The American Garden, all for One Year,** and in addition we will send **Free** to every subscriber, **Five Useful and Valuable Premiums,** as follows: 1. **A Fine Heavy Silver-Plated Butter Knife,** of a new, stylish, and beautiful pattern, warranted heavily plated with pure coin silver and to last for years, a most useful and valuable adornment for any table. 2. **A Handsome Photograph Album,** size 5½ x 4 inches, bound in imitation morocco; with gilt stamping, containing ample spaces to hold all the family portraits. 3. **The Fan Autograph Album,** a new novelty, consisting of an autograph album in the form of a fan, with cord and tassels attached; very useful for young ladies at balls, private parties, picnics, etc. 4. **Necklace and Charm, of Imitation Coral,** a very pretty necklace with charm attached, suitable either for a child or grown person. 5. **A Delightful Article for the Toilet,** consisting of beautiful shell thoroughly impregnated with a delicate and lasting perfume, which may be placed upon the toilet table or among clothing and will impart an exquisite perfume to everything with which it comes in contact; each is enclosed in a beautiful box, with handsome chromos upon the cover. Remember, we give the whole three periodicals, *The Fireside at Home, The People's Home Journal,* and *The American Garden,* all for *One Year,* together with the entire list of *five valuable premiums* named above, upon receipt of **Only One Dollar** and **12 cents** extra to pay postage on the premiums. *The Fireside at Home* is a large and elegant magazine of 36 large, 3-column pages, including a handsome cover, profusely illustrated, and containing in every number a great abundance of the most useful and entertaining reading matter, including serial and short stories, poems, sketches of travel and manners and customs of different countries, Home Decoration, Sermons by Prominent Divines, Farm and Garden Topics, Household Receipts, Stories, Games and Puzzles for the Young, Wit and Humor, etc., etc.—in fact, it is the largest, handsomest and most entertaining dollar magazine published. *The People's Home Journal* is a 16-page, 48-column illustrated journal of the same general character as *The Fireside at Home,* though the contents of the two are entirely different. *The American Garden* is a large, 16-page journal, beautifully illustrated and printed upon heavy tinted book paper, devoted to the culture of Vegetables, Fruit, Flowers, Landscape and Window Gardening, Rural Life, etc., and containing in every number hundreds of valuable hints and suggestions regarding these important subjects. By taking advantage of this great offer, you will secure a whole year's subscription to three of the best periodicals published, and five useful and handsome premiums, all at a cost of only **$1.12.** The premiums are all first-class articles—we give no cheap or trashy merchandise. No one can afford to miss so great an offer, for never before was so much given for so little money, and we make the offer simply for the purpose of introducing our periodicals. Send us five subscriptions upon these terms with $5.60, and we will give you an extra subscription to the three periodicals and the premiums free for your trouble. Perfect satisfaction guaranteed or money refunded. As to our reliability, we refer to the leading newspaper publishers in this city. Address:

F. M. LUPTON, Publisher, 27 Park Place, New York.

Reading for the Young.

A CHILD'S SATIRE.

CHILDREN want always the "truliest" things.
The things that come nearest to life;
Grown-up and real; for—Sweet little things
They *believe* in the world and his wife.

Katie wanted a doll for her Christmas this year,
A doll that could do something grand;
"Not cry; that's for babies;" nor might it suffice,
That she simply could sit and could stand.

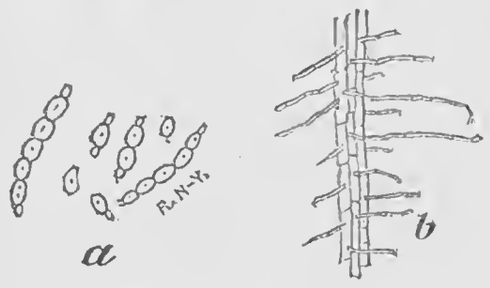
"And I don't care for eyes that will open and shut,"
"You did," "Well the care is all gone,
"I've seen 'em enough, mamma; I want a doll
With hair that takes off and puts on."

FARMING FOR BOYS AND GIRLS—NO. 13.

HENRY STEWART.

How Plants Grow.

ONE of the most wonderful things in nature is the growth of a plant. We take a seed and hang it by a thread to the cork of a bottle which contains water, very close to the water, but not touching it, and as it absorbs moisture it swells and soon puts out a tiny rootlet and afterwards a spire. The rootlet seeks the water and the spire reaches upwards into the air. The rootlet, at first, seems to be a single slender thread, but the human eye is unable alone to see of what this thread is composed. Although it is so small that a hundred of them laid close together side by side measure but one inch, yet by the aid of a powerful microscope we can easily make it to appear several inches thick and then see its whole structure. The farmer's boy or girl who owns a microscope of even a very cheap kind is, as it were, supplied with a new eye, by which some most wonderful and beautiful things can be seen; and there is nothing more interesting to a young student than the study of growing plants. By examining, then, the tiny root which starts from a grain of corn suspended by the thread, we find it is made up of what are called cells, and first we will see what a cell is. Although very small and insignificant, every living plant and every animal is wholly made up of cells. One of the lowest in the scale of plants is the yeast plant, of which the yeast used in making bread consists. If we examine a small quantity of yeast under a microscope, we can see the plant growing. We find it to consist of what are called simple cells; these are very small, round bodies which contain a fluid surrounded by a thin membrane, and are shaped something like eggs. Each one contains a central germ or nucleus in



PLANT CELLS AND ROOT.—FIG. 108.

which its vital principle or life exists. As the plant grows a new cell buds out at the end of the parent cell as shown in fig. *a*, until a string of cells is formed; when these break from each other, each cell begins business for itself. This is the lowest class of cell life, but the highest plant or animal is made up of such cells, which, however have a different method of increasing themselves.

At fig. *b*, is shown a part of the root of a corn plant magnified 160,000 times or 400 diameters. The cells of this are seen to be long and narrow. They have no separate life and do not increase by budding, but by the growth of new cells at the extremity of the tissue.

The tissue is the matter formed by the cells which adhere together in a mass and make up the substance of the plant. The cells contain water in which is held in solution the substance of which new cells are formed, the food of the plant, in fact. The spire or plumule of the plant which grows upwards and which in time forms the stem, is built up of cells in the same manner as the roots. It has been thought and said by persons who do not know, that the seed contains the whole future plant, of very small size, but fully formed and needing only to be enlarged gradually until it attains its full size. This is not correct. The seed contains the germ or the beginning of the plant precisely as an egg contains the germ or beginning of a chicken. When the seed starts into growth the cells of the germ enlarge and others are added to them, the young plant just started into life feeding upon the substance of the seed which is changed by the moisture and the warmth of the soil from starch into sugar, which nourishes the growing cells and affords material for the structure of new ones. When the seed is exhausted, or all used up by the young plant, the new roots begin to feed upon the soil, and as new food is thus found new cells are formed and the plant grows by the addition of these cells. In this manner the smallest blade of grass, the perfect wheat or corn plant, or the largest tree grows and forms itself by the force of a law or plan which never makes a mistake; the root grows downward the stem upward; the leaf, the flower and the fruit are all formed, each in its own peculiar manner, by one of those unerring and mysterious, but ever certain laws which are the wonder and the admiration of the studious person, who will take the trouble, or rather who will enjoy the pleasure of investigating the works of nature.

CLEOPATRA'S NEEDLE.

PERHAPS it would be interesting to the RURAL cousins who live far away from the great, busy metropolis, to know something about the obelisk or Cleopatra's Needle, which has lately been erected in Central Park in this city. It may seem strange that a great stone of red granite about 70 feet in length and seven feet square at the base, gradually tapering till it ends at the top in a small, pointed, four-sided pyramid, should be called a needle, but such is the name by which it is known. This Needle was erected at Heliopolis about 3600 years ago by Thothmes III., one of the ancient Kings of Egypt, but from that place it was taken by Augustus Cæsar, the Roman Emperor, to Alexandria where Cleopatra had formerly lived. It was a trophy of Cæsar's victory over the kings of Egypt.

"How did it happen," some of the children may have already asked, "that this huge stone weighing over 200 tons was brought over to America."

Well, this was the reason for it:

Our American Consul, knowing that Mehemet Ali, late Khedive of Egypt, had a peculiar liking for America, thought he would ask him for one of the many obelisks in his kingdom, but he did not suppose that the great Cleopatra's Needle would be the one given. But sure enough, the Khedive proposed to give us this one, inasmuch as it stood right on the shore of the Mediterranean, and was in danger of being undermined by the waves.

The Khedive said he would give half the money required to remove it, if the people of Alexandria would give the other half, but this they would not do. Mehemet Ali being much displeased at this, made up his mind to make the great obelisk a present from the oldest nation of the world, to the youngest. When his intentions were made known in America, one of our wealthy citizens said he would give $75,000 to pay for the removal as soon as the huge stone was erected in Central Park.

But Lieutenant-commander Gorringe, who has brought it safely over the waters to its destination, has done all this thus far at his own expense, and he deserves great credit for it. We can hardly imagine what a wonderful undertaking it has been to remove such a heavy body from its foundation away on the shores of the Mediterranean, lower it into a great vessel, transport it across the sea, unload it by cutting a great hole in the vessel through which to drag it out, and after 98 days from the time of landing, place it in an erect position in Central Park, but all this has been successfully done, without injuring or defacing the obelisk at all.

UNCLE MARK.

TOM AND FRIZZLE.

MAUDE MEREDITH.

Tom had the sharpest claws, and the wickedest teeth of any cat I ever saw.

"What a treasure," all the neighbor's said, when Tom would deposit an old rodent or fat field mouse just outside the porch door, and he was always bringing them, so you see he had lots of compliments. But Tom never thought to be vain. He was very wise anyway and could be talked to so much; if he did not understand all we said he did some of it, for when we bought Dick, a beautiful German canary, we told Tom all about it, and he never offered to catch the bird, but would drive all other cats out of the yard; first send them spinning, and how the cats would go over the back yard fence when he skurried after them; and we always thought it was to save Dick.

I think the most wonderful feat he ever performed was to catch a chicken hawk.

Wonder how?———Tom used to enjoy sitting upon the fence, and watching the little chickens. When he was small, he tried to catch one, and his mistress, to teach him better, pounded him on his head with a new tin pan. I guess it did not hurt much, but it made an awful noise, and ever after that he would shake his head whenever he saw chicks, climb up somewhere, and sit and look down. So this day he was up on the end of a pile of boards, I presume out of sight, for the hawk pounced down, and had just set its sharp talons into the poor chick, while there was a great fluttering and screaming all over the poultry yard, when down came Tom, great heavy fellow that he was, and set his teeth into the back of the hawk's neck.

Brother Charlie saw it all, and ran out and helped Tom. I made a little duster of the long white hawk feathers, and saved it in honor of Tom's bravery.

But he could also be gentle and kind, and when Frizzle came, he took him for a play-fellow and never harmed so much as a hair of his bushy tail.

Frizzle you see was a squirrel, a little striped "Chipmunk," that Tom brought in one day, and when Charlie said, "Tom! let me have your squirrel," he let go of him, and off the little fellow ran like a flash, around the stove to where Charlie had just set his boots to dry, for it was a rainy day in Spring, and down he went in one of them.

Then we sat an empty bird cage on the floor placed the boot in front of the door, rapped on it, and away went chippy into the cage.

He was wild at first, and a little lame, for Tom had hurt him some, but he soon got well, and grew real tame.

We called him Frizzle or Friz, and he would prick up his cunning little ears, and look about when we called him.

We used to set the cage on the floor, and let Tom see it; afterwards we let Friz out about the room, and in time he and the cat would play together. And such funny places as Friz would hide in, but Tom would hunt him and with velvet paws give him a pat, to let him know he was found out, then Friz would whisk off with a loud ch-u-r-r, and scamper all over the chairs and sewing-machine, and once he ran out on the top of the bird's cage, and scared poor Dick almost to death.

When Tom would curl up on the low stove-hearth in the kitchen and feign sleep, Frizzle would whisk over and over him and at last bite his ears, for which he would often get a cuff that sent him out into the middle of the floor.

We kept Frizzle for a long time but one unlucky day he ran off over the garden fence just for a race, and went very near to a great gray cat that looked precisely like Tom. There was a whisk and a snap and away went puss with poor Frizzle in her mouth and we could not catch her though we raced half across the pasture. So we never saw Frizzle again.

LETTER FROM THE COUSINS.

DEAR UNCLE MARK:—For 12 long months I have promised myself to ask admittance to your Horticultural Club, and be enrolled among the cousins of the grand old RURAL. Pa has taken the RURAL for the last year, and among some half-dozen or more papers, that he receives (several of which are agricultural), he and all of the family look more eagerly for the coming of the RURAL than any other, and the first question asked on returning from the post-office on "RURAL's day," as we call it, is, "has the RURAL come?" It is literally impossible for us to get along without it. I love to read the cousins' letters; and even Pa reads every one of them. Won't you remember me, Uncle Mark, when you distribute seeds, &c. this year? I will get Pa to instruct me, and try how well I can do with them. He is all the time experimenting with some new kinds of seeds or plants, and I tell him that he doctors his plants more than he does his patients.

MARY LEE STONEBACKER.

DEAR UNCLE MARK:—I have never written to you, but will try and see what I can do. I am 10 years old. Last May I planted a half bushel of potatoes and raised 10 bushels from them; I also raised citrons, beans, beets, etc. I have a Holstein yearling; his head and shoulders and hind parts are black, while from his shoulders to his hips is white. This gives him the appearance of being a black calf wearing a white blanket. His name is "Ellsworth." Very cold weather commenced here Nov. 21st, and we have not had a thaw since. Traveling is good, and that makes business lively, especially lumbering. My cousin, George W. Ingraham, was one of the mail agents who was burned at Tioga Center recently. The post office and firemen's hall are draped in mourning for him. I have lots of fun coasting this Winter.

Binghamton, N. Y. CHAS. W. INGRAHAM.

DEAR UNCLE MARK: If you were less obliging your numerous nieces would not trouble you so often for favors. Will you please give me the address of cousins Anna Crouse and Estelle B. Hunter, whose letters appeared in the RURAL of Dec. 25, 1880? Please remember me in your free seed distribution for 1881, I will try to have better luck with my seed this year than I did last. Cousins don't you think we ought to unite and make Uncle Mark a present on his next birthday as a token of our appreciation of his kindness? Will some of the cousins make some practical suggestion?

Russelville, Ala. ALMA ALLEN.

[Anna Crouse's address is Doylestown, Wayne Co., Ohio, and Estelle B. Hunter's is Southington, Hartford Co., Conn. Alma is exceedingly kind but Uncle Mark is content to take the "will for the deed."—U. M.]

DEAR UNCLE MARK AND RURAL COUSINS:—I am a little girl ten years old. I go to school and study Ray's Arithmetic, Grammar, Geography, and read in the Fifth Reader. We live in a small village on the B. & O. R. R. The school house is on the second lot from our house. We had a vacation during holiday week. I have a real Uncle Mark, and if you are as full of fun as he is I would like to see you. We have a jolly good time whenever my Uncle Mark comes to see us. He makes every body laugh, whether they want to or not.

I have four pets: a cat, a white rabbit and a pair of canaries. I would like to join your Club, for I am a great lover of flowers. We have a great many flowers in Summer, but not very many house-plants this Winter. If this does not go in the waste basket I will write again. Your niece,

Marshall Co., Ind. FLORENCE A. EMERSON.

DEAR UNCLE MARK:—I received the seeds that you so kindly sent me. The flowers were beautiful and bloomed throughout the Summer. We had a great many roses also. The weather was damp, so they bloomed a great deal. The muskmelon did not do so well. The fruit rotted before ripening, but we secured a couple of specimens and saved the seed from them, which we shall plant this year, when we hope for better success. The Winter has been very wet and cold. This is the first Winter in several years that we have had enough snow for sleighing. The snow is all gone and the ice is out of the lakes now, and I will have to commence work in my flower garden soon. I saw to-day that the hyacinths and Stars of Bethlehem are peeping out of the ground.

Norfolk, Va. LILLIE S. BABCOCK.

DEAR UNCLE MARK:—We all like the Horticultural Club first-rate until it comes to the reporting, and that we don't like one bit, for if one has been successful in growing the seeds and plants, it looks like bragging to tell about it, and if one fails to make them grow well, one hates to confess it. We received the seeds the first week in April, and all were planted in boxes except the mignonette. We had only seven plants of the phlox, but the other seeds all did better. They were transplanted about the middle of May, and they grew and bloomed beautifully all Summer. There were two or three of the portulacas different from any we ever had. The Chineso Pinks were of great variety and very nice. So, altogether, they have given us much pleasure, for which we wish to thank Uncle Mark most sincerely. IRENE M. SMITH.

Tangent, Linn Co., Oregon.

DEAR UNCLE MARK: I do not know whether you are related to all the readers of the RURAL or not. But I wish that you would be my uncle long enough, to tell me whether a young lady with a few acres of ground within three miles of Philadelphia could make hop growing pay, and if there is anything I could read on hop culture! If you will be kind enough to enlighten me, I will be very much indebted to you. HELEN.

[Although hop culture has not paid very well for a few years past, I see no reason why it should not be fairly remunerative in the location of which you speak. You can obtain a little book entitled "Hop Culture" of the American News Co. of this city. Price 30 cents.—U. M.]

To produce real genuine sleep and childlike repose all night, take a little Hop Bitters on retiring.

Trees, Seeds, Plants, &c.

NEW FRUIT AND ORNAMENTAL TREES

Besides the largest and most complete general stock of Fruit and Ornamental Trees in the United States, we have the pleasure to offer the following **Choice Novelties: APPLES.**—Red Bietigheimer, Stump, Sutton Beauty. **PEARS.**—Souvenir du Congres, Petite Marguerite, Ansault. **PEACHES.**—Waterloo, Conkling. **GRAPES.**—Monroe, Rochester, Lady Washington. **STRAWBERRIES.**—Sharpless and others. PERSONAL ITEMS.

The long-talked of marriage between the Baroness Burdett-Coutts and Mr. William L. Ashmead Bartlett took place Saturday.

Boston papers print a rumor that Mr. James Russell Lowell is desirous of resigning the mission to England and returning to his professorship at Harvard college.

Carlyle's grave is in the old cemetery of the Scotch hamlet of Ecclefechan, in Dumfriesshire, where he was born, while his much-mourned wife's grave is in a ruined aisle of Haddington.

King Kalakaua, the Hawaiian, dresses simply, wears no jewelry and no decorations. He is a remarkably handsome man, more than six feet in height. His carriage is erect, his beard, moustache and eyes are black, and his expression is amiable.

Vennor is a man below the medium height, and of stout build, modest in manner and of pleasant address. He has a hardy, weather beaten countenance, is of sandy complexion, and presents an appearance that does not indicate a man above thirty-five years of age.

Compound Oxygen in Epilepsy.

The following is an extract from a letter received from a patient who had used Compound Oxygen for EPILEPSY. It is dated March, 1879: "I commenced taking the Compound Oxygen last April (1878) for epilepsy, and have taken four months' treatment. It has helped me more than all the medicines which I have taken for the last five years. Have only had spasms one time since I commenced taking the Oxygen. I think I am entirely cured of the spasms, and I have not taken the Oxygen regularly for several months, and my health is better in every way than for several years before." Our Treatise on Compound Oxygen, which is sent free, will be found of great value to all who are suffering from any chronic disease. Address DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

Trees, Seeds, Plants, &c.

Miscellaneous.

BOWKER'S HILL AND DRILL PHOSPHATE
SEND FOR PAMPHLET.
This is a true bone superphosphate, and may be used *on any crop,* in the hill or drill or broadcast, either *with* or *without* manure, and will produce a much earlier and larger crop. In the Report of the Mass. Inspector of Fertilizers, its valuation is from $3 to $10 per ton higher than other Phosphates which sell at the same price. The past year over 3000 tons were sold against 100 tons three years ago, showing that it is liked by the farmers. If there is no local agent near you, send to us.
Also for sale STOCKBRIDGE MANURES.
BOWKER FERTILIZER CO.
BOSTON & NEW YORK

$72 a week, $12 a day at home easily made. Costly outfit free. Address True & Co., Augusta, Maine.

$66 a week in your own town. Terms and $5 outfit free. Address H. Hallett & Co., Portland, Maine

New Publications.

FIVE FAMOUS OPERAS

MIGNON. ($3.) Opera By AMBOROISE THOMAS This very successful opera first became known in Paris, where it slowly but surely worked its way to permanent distinction, and has become one of the standards. It is very full, occupies 405 pages, and furnishes to the purchaser quite a library of music of high order.

AIDA. ($2.) Grand Opera by VERDI, Composed in the first instance for the ruler of Egypt, and first given in that ancient kingdom, where also the scene of the story is laid. The strange life of old forgotten ages comes before us, and is made vivid by the thrilling music of one of the most brilliant of composers.

CARMEN. ($2.) By GEORGES BIZET. A Spanish Opera, introducing Spanish Gypsies, Soldiers, Spanish Dons, a Torreador, and Spanish Contraband Traders. We are in contact with the *bizarre* ways and incidents of the Spanish Peninsula, and the music is quite in consonance with the prevailing brightness.

MEFISTOFELE. ($2.) By A. BOITO. Mefistofele is the true fiend, according to Goethe, whose poem is closely followed throughout. A daring composition, romantic and weird, and now widely given, and pronounced a success.

FATINITZA. ($2.) By F. von SUPPE, whose music is most taking, and who introduces us, in a free and easy and humorous way, to Russians and Turks during the war. Very popular.
☞ Any book mailed, post-free, for retail price.

Wells, Richardson & Co's
PERFECTED BUTTER COLOR
It Gives Butter the gilt-edged color the year round. The largest Butter Buyers recommend its use. Thousands of Dairymen say **IT IS PERFECT.** Used by all the best Creameries. Awarded the International Diploma at N. Y. Dairy Fair. Ask your druggist or merchant for it; or write to ask what it is, what it costs, who uses it, where to get it. **WELLS, RICHARDSON & CO., Proprietors, Burlington, Vt.**
USE ONLY THIS THE FIRST AND THE BEST

Useless and Hurtful Medicines.

There is a certain class of remedies for constipation absolutely useless. These are boluses and potions made in great part of popophyllin, aloes, rhubarb, gamboge and other worthless ingredients. The damage they do to the stomachs of those who use them is incalculable. They evacuate the bowels, it is true, but always do so violently and profusely, and besides gripe the bowels. Their effect is to weaken both them and the stomach. Better far to use the agreeable and salutary aperient, Hostetter's Stomach Bitters, the laxative effect of which is never preceded by pain, or accompanied by a convulsive, violent action of the bowels. On the contrary, it invigorates those organs, the stomach and the entire system. As a means of curing and preventing malarial fevers, no medicine can compare with it, and it remedies nervous debility, rheumatism, kidney and bladder inactivity, and other inorganic ailments.

BUTTER SALT.

The salt used is of greater importance than might easily be considered. The usual impurities of salt are chloride and sulphate of lime and chloride and sulphate of magnesia. Lime mixed with fats combines and forms an insoluble white soap. When lime is present in salt, small, white specks of soapy substance are formed in the butter, thus injuring its keeping qualities. Magnesia is bitter, and if this is present the flavor is injured, so that it is of the greatest importance to have the purest salt. Unfortunately, our American salt is not of sufficient purity or uniformity for dairy purposes, and the best qualities only of English salt should be used. Of these there are two kinds on the market, known as the Ashton, and Higgin's Eureka. The latter is fast superseding the former on account of its perfect purity, uniformity of grain and freedom from objectionable scale. As the difference in price between good and bad salt is very small, and the difference between good and bad butter is very large, the extra cost of a sack of the best salt may easily be saved upon one pail of butter. A hundred pounds of salt will pack 1,600 pounds of butter, and two to five cents a pound on this quantity may easily be lost by means of bad salt, making a loss of $30 to $80 to offset the gain of one dollar or less.—*Henry Stewart in Rural New-Yorker.*

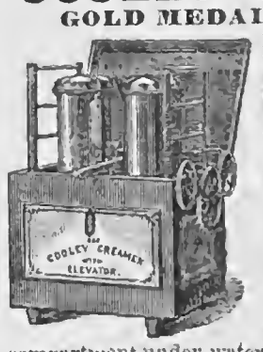
COOLEY CREAMER.
GOLD MEDAL, PARIS, 1879.



Butter made by this Process was awarded Sweepstakes at International DAIRY FAIR, 1878, and Gold Medal at same Fair, 1879.
Gold Medal at Royal Agricultural Exhibition, London, 1879.
MANUFACTURED IN FOUR STYLES and TEN SIZES.
THE REGULAR.—The cans in this, removed to bench for skimming automatically
THE JUNIOR.—Skimming done automatically without removing cans.
THE UPRIGHT OR CABINET.—Has a compartment under water tank, the illuminated conical point of cans projecting into this compartment, skims without removing cans.
THE ELEVATOR.—Has a hoisting arrangement for raising cans out of tank. Milk drawn off automatically before removing cans form platform of elevator.
They require no milk-room. They raise all of cream between milkings. Impure air, dust or flies cannot reach milk set in them. The cans are submerged and water sealed in each style.
Each style has transparent panes for the purpose of determining when the milk is out, and cream about to flow. Our patents cover these processes.
No others have a right to use them.
Send for "DAIRYMAN" giving particulars.

THE RELATION BETWEEN THE CHEMICAL COMPOSITION AND THE QUALITY OF FRUITS.

PROFESSOR G. C. CALDWELL.

THE most important constituents of fruits, that affect their quality for eating, are the sugars, the acids, and a group of tasteless, gelatinous or gummy substances belonging mostly to what chemists call the pectose group. The good quality of the fruit depends on the relative proportions of all these three kinds of substances. First in importance is the proportion of sugar to acid; secondly, the effect of this proportion may be modified by the relative quantity of the substances of the last-mentioned group; though tasteless they may so inclose the acid and mask its sour taste as to diminish its unfavorable effect when present in too large proportion. The pleasant quality of the fruit is also dependent on its aroma, due to minute quantities of volatile oils, and on the proportion of soluble to insoluble matter; if there is much soluble matter, well flavored, and much water, the fruit melts in the mouth when the cells are crushed, like a ripe peach. There is a concentration of the agreeable effect which is not produced by a drier and more insoluble fruit whose ingredients act more slowly on the palate.

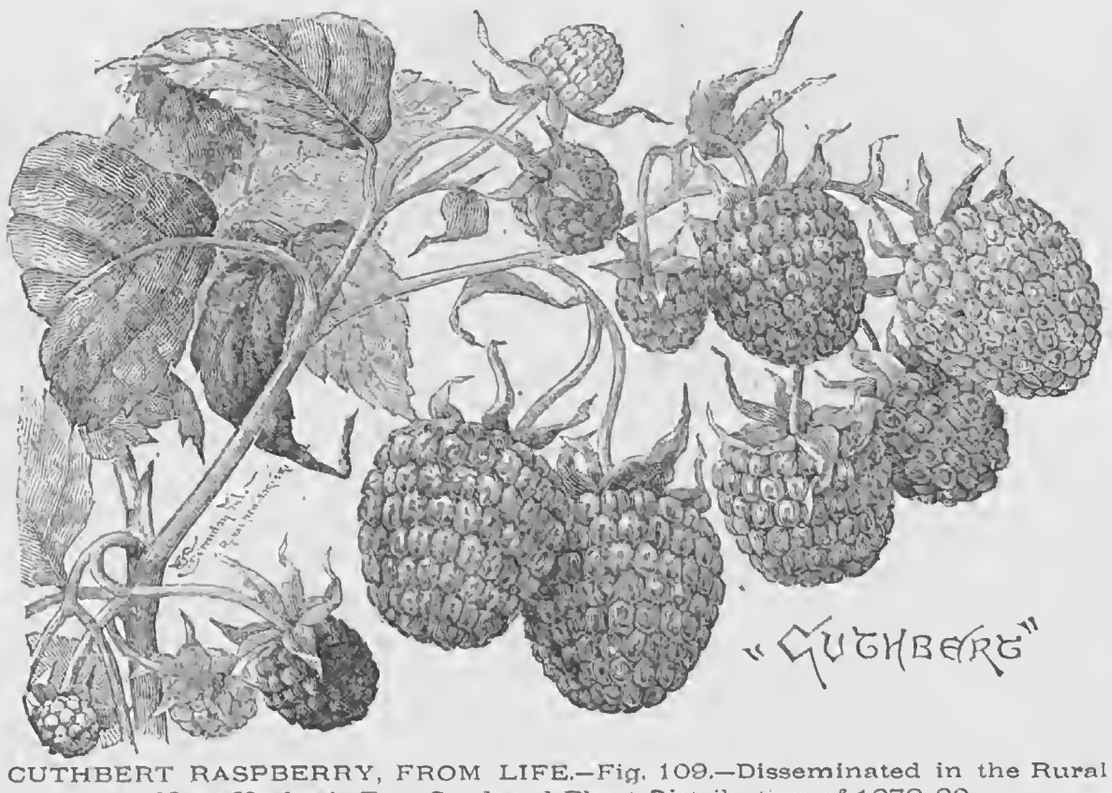
It is well known that the quality of the fruit depends in some measure on the character of the season, both the aroma and the proportion of sugar to acid being thereby affected. Schuebeler found that in the short but uninterrupted sunlight of Scandinavia, the aroma of fruits was stronger than that of the same kinds of fruits grown further South, but the sweetness was less; plums were so sour as to seem unripe to those accustomed to the plums of southern climates; but while the strawberries of Portugal were very sweet and large, they were poor in aroma and flavor as compared with the Scandinavian berries. The climatic influence on the quality of fruit is otherwise shown in the ratio of sugar to acid in the case of wild strawberries, which in one year may contain only two parts of sugar to one of acid, but in a more favorable season may contain 8.5 parts of sugar to one of acid. This change in the ratio is due both to an increase in the percentage of sugar and a diminution in respect to the acid.

Arranging the small fruits according to their richness in sugar and in acid on the basis of such analyses as have been made, they stand in the following order:

	Sugar		Acid.
Gooseberry	7.	Strawberry	0.9
Currant	6.4	Blackberry	1.2
Strawberry	6.3	Gooseberry	1.4
Blueberry	5.	Raspberry	1.4
Blackberry	4.4	Blueberry	1.6
Raspberry	4.	Currant	2.1

Only a single analysis each of the raspberry and blackberry has been made; on a better acquaintance with their chemical composition they might be located differently with respect to the other fruits. None of these fruits, however, stands so high as the grape, with its average proportion of 14.4 per cent. of sugar, and only 0.8 per cent. of acid. Compared with stone and core fruits, the berries contain a larger proportion of acid, and at the same time less of the neutral substances to cover up and temper the acid, so that for a double reason they are generally more sour to the taste.

Whatever may be the effect of the temperature of the season and of the amount and distribution of the sunlight on the quality of the fruit, we must make the best of it, for we cannot change the weather; but cultivation of fruit generally improves its quality, at least in regard to its proportion of sugar and acid, by increasing the one and lessening the other, although the wild fruit may excel in delicacy of aroma. Some wild berries have, however, shown quite as favorable a proportion of sugar and acid as has been found in the best cultivated varieties that have been analyzed. That the character of the manuring has something to do with the change in the quality of the fruit is shown by some experiments by Dr. Goessman, at the Mass. Agricultural College. By manuring the wild grape liberally with potash and phosphoric acid, he changed the ratio of sugar to acid to that of the Concord Grape. That the potash may take some special part in the modification of the ratio is indicated by the fact that the cultivated berry contains over twice as large a proportion of this substance in its ash as is found in the ash of the more sour wild fruit. Putting all these facts together, it seems reasonable to hope that by judicious use of concentrated fertilizers, sweeter small fruits might be produced at the pleasure of the gardener. This is a promising and inviting field for experimentation, which has been but little occupied, and satisfactory experiments with small fruits can be conducted on a less extensive scale and at less expense than with field crops.



CUTHBERT RASPBERRY, FROM LIFE.—Fig. 109.—Disseminated in the Rural New-Yorker's Free Seed and Plant Distribution of 1879-80.

STRAWBERRIES.

T. T. LYON.

MY experience during the past season has developed little reliable or conclusive as to the status of the newer candidates for popular favor; I therefore rely, to a considerable extent, upon the observation, experience and conclusions of others in the following remarks upon varieties:

SHARPLESS is very satisfactory so far as the vigor of the plant and the size of the fruit are concerned, but it is too soft, and there is much doubt of its ability to sustain its reputation as

a producer. It is of fair quality for so large a fruit.

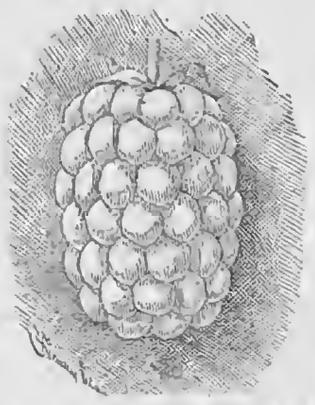
CRESCENT SEEDLING has been appropriately characterized as the "lazy man's strawberry." It bears a favorable comparison with the Wilson in this respect. It is a rampant grower, but too soft; while Wilson is firm, but of only moderate vigor. Neither can ever become popular with the best growers.

SENECA QUEEN is my favorite on account of its fine, even size, great beauty and fine quality. If I were compelled to choose one variety, to the exclusion of all others, with my present experience, I am not sure but it would be this.

SHIRTS is doing well. It is satisfactory in size, quality and appearance, and is, I think, firm enough. We need to know more as to its productiveness in different localities before it can take position as a market berry.

MARVIN has pretty well established a reputation as a large, firm, bright-colored, very late and productive berry. The plant is about as vigorous as Wilson. More time is needed to establish its character as a producer in different soils and localities. I have much faith in its future.

WINDSOR CHIEF seems generally to be characterized as the "Champion, and *only* Champion." The alleged originator has been appealed to, to demonstrate (if he can) its distinct origin, by giving to the public a history thereof. This he seems to have omitted to do. The natural inference would seem to be that such history may not be able to bear the light of criticism; hence there would seem to be occasion to doubt the fact of its distinct origin. The originator certainly owes it to himself to allay such doubt, if possible.



CRYSTAL WHITE BLACKBERRY. —FIG. 110. See page 162.

BIDWELL had its origin seven or more years since, as is alleged, at this place. It has received a most favorable notice from the Michigan Pomological Society. Still it remains comparatively unknown at home; although at the East, where it has recently become known, it seems to be attracting much attention. The plant is very vigorous, and the fruit large, bright-colored and of superior quality. It is firm enough for market, and under good management will be found profitable, especially so on light soils.

GLENDALE possesses many good qualities as a market berry. The chief doubt respecting its value for that purpose lies in the question of productiveness.

RUSSELL'S ADVANCE is, in most respects, a very desirable berry; but more time is needed to determine as to its productiveness and consequent value for the market.

BURGESS is a comparatively new sort, of which little seems yet to be known. It purports to come to us from Rhode Island. It is esteemed valuable by those who have most fully tried it.

Among the varieties that have been some time before the public without having attracted special attention, I regard the following as desirable, and several of them highly valuable, especially Early Hudson, Cowing's Seedling, Duncan, Duchess, Charles Downing, Matilda, Champion, and Monarch of the West; while Cumberland Triumph, Boyden's No. 30, Black Defiance, Major McMahon, Hudson's No. 10, Kentucky, and Springdale are scarcely less so. In the hands of good cultivators several of them would doubtless have been found highly profitable as market sorts.

Among the many that have now been some time on trial, without having achieved decided popularity, the following seem to be just desirable enough to be laid on the shelf with a lingering regret, viz: Captain Jack (it should have been honored with a better name), Col. Cheney, Seneca Chief (which is only exceptionally successful), Burr Oak, Caroline, General Sherman, Victoria (Golden Queen), and, perhaps, Frontenac, which, although excellent in quality, is hopelessly unproductive. Several of these, under favorable conditions, prove to be highly desirable as amateur or family berries.

There remains yet another class of varieties which, with us, have not yet grown and fruited under circumstances so favorable as to demonstrate either a warrant for commendation or condemnation, of which, without doubt, the successful ones may be expected to be the rare exceptions, while the great mass will be buried in oblivion. Of such I name Belle, Centennial Favorite, Cinderella, Continental, Crystal City, Durand's Beauty, Early Adela, Forest Rose, Iowa Prolific, Miner's Great Prolific, New Dominion, New Jersey, Scarlet, Pioneer, President Lincoln, Rappahannock, Red Jacket. To these might be added a still longer list of those which, although they still linger in the catalogues of nurserymen and in the list of amateurs, are hopelessly beyond the pale of popular recognition and approval.

RASPBERRIES.

GREGG has fruited here the past season and seems destined to supersede those old favorites, Mammoth Cluster and Doolittle, with those who grow the Black Caps, although at the Lake Shore, where most of the red varieties are sufficiently hardy, they are generally grown, since the fruit is preferred in the market.

CLARKE is somewhat grown for the early market, but its lack of productiveness is a serious obstacle to its popularity.

DELAWARE is very little known here, and it may fairly be doubted whether any amount of "pushing" or advertising could give it popularity with planters. Although firm and bright-colored, it lacks quality.

THWACK is a strong grower and productive, but it is far from attractive in color as compared with several others, while it is sadly deficient in quality. I was astonished to hear it so highly lauded at the last meeting of the American Pomological Society by some men who, beyond doubt, must have understood its lack in this respect.

BRANDYWINE is better known here, and is bright colored, firm and early; but it is too small and has not always shown itself productive.

HERSTINE has size, quality and color in its favor, and seems likely to lead in popularity, notwithstanding its decided lack of firmness, unless it shall be superseded by

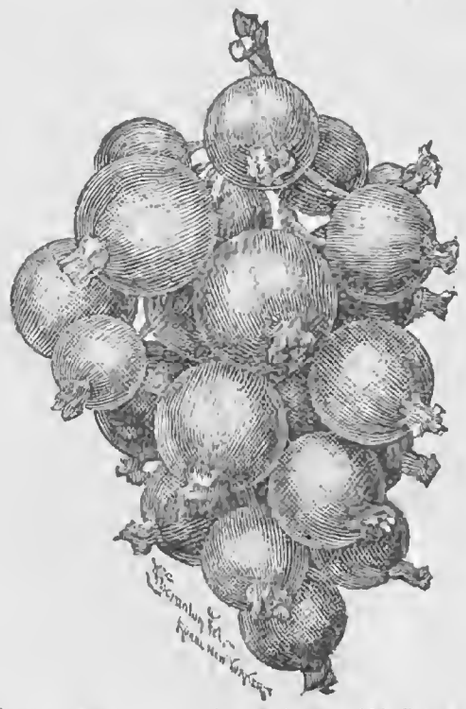
CUTHBERT, which is yet little known, although highly prized by those who have proved it.

MONTCLAIR is another berry as yet undisseminated here. It has, however, fruited here the last two years, and, although a brighter color might be desirable, its firmness, fine size and high quality, together with its slight tendency to sucker, are strong points in its favor.

SMALL FRUITS.

GEN. WM. H. NOBLE, BRIDGEPORT, CONN.

SMALL fruits, in our climate, mean, I take it, currants, gooseberries, blackberries, raspberries, strawberries and grapes. Their culture for profit, home comfort and health should have the widest welcome. No industry will average any richer dividends from the market than these nattily offered and well grown supplies. They may be raised in fine form, under the richest culture, yet if they are not marketed neatly, in good order, free from mussiness, and freshly picked, the fruit raiser will be disgusted with his returns. A good many slovenly growers meet rebuffs to the uncomely offerings of their goods, which they are blind enough to think due to a public want of taste for small fruits. But there is in cities and large towns an almost unlimited market for fruits to which culture has done justice and which the owner offers measured out and boxed in handy shape to handle. No man should market fruit who does not make it a business. Because you have a few quarts of any kind beyond your home supply, don't fill your tin kettle or peck measure and dump into a store to swap for groceries. Give your overplus to some nice neighbor or some poor, lone widow, whose home room or pinched affairs will not admit growing them or buying them.



LEE'S PROLIFIC CURRANT (BLACK)—FIG. 111. See p. 161

Every householder, both for the love of the fruit and the joy of its culture and possession, should plant some of these small fruits. An abundance is the duty and the glory of any large place. No house lot, however small, should be without some of the assortment. It is wonderful what crops every kind will yield to a busy worker in his home lot. Every vacant place, every drooping shed, every fence border can be made to rejoice in their fruitage. Of course they cannot be left to take care of themselves as ordinary fruits often are, in the wide garden or fruit farm. A good deal of Winter pruning, frequent Summer pinching, skill and judgment in training to cover unoccupied spaces, and a deftness that only practice teaches, must beget plenty and excellence.

Some of the care and constant watchfulness over small fruits in the little home is not out of place either in larger grounds or on the fruit farm. I'll leave the larger cultivators to take care of themselves and devote a few words to the methods by which a plenty of small fruits can be had in the narrowest domain.

And first about grapes:—I have a friend who, from a single line of Clinton Grape on a galvanized wire, gets bushels of the fruit. On a 25-foot lot twelve such vines can be trained up on to the lean-to or rear walls of the dwelling, stretching up 30 feet or more, both studded with fruit and shading the house. Strong posts around your little rear yard may hold as many more. Then along the borders below the grapes you may have currants trained to single stems and tied to horizontal wires, ripening in their season a delightful abundance. Gooseberries so trained, of our hardy, unmildewing American kinds, will give you lots of the luscious fruit. Some of those hardy modern Black-cap raspberries trained in some odd place will cheer your table with their harvest. Even the thorny Lawton or some of the hardier kinds of blackberries, trimmed and trained and pruned and pinched, will give a large supply for their season.

Then as to strawberries, not much can be done with any kind of comfort in an ordinary city lot. But in a small homestead of 50x100 feet there is, after all these other fruits are provided for, still room for a strawberry bed to supply that delightful fruit from the beginning to the ending of its season. On this joy of the table the householder should expend his soul. Its soil should be deep and rich, but not with too rank manure; every runner should be clipped during its bearing season. In separate rows he should have kinds covering the first blush of this fruit to its latest yield. Not a weed or a grass-spire should be found; but all should be well mulched to keep the berries from the spattering rain and dirt. Through the fearing season drench with water. This latter is a very needed thing which the large growers cannot furnish. But for it the strawberry's appetite is so great that nothing will so help out the cotter's crop, as to the bigness and abundance of its yield and the duration of its season, as an abundant supply of water nights and mornings.

Nothing so binds to our hearts the sacred memories of home as the joyousness of the family table well supplied with small fruits. The little youngsters from their earliest youth so relish these healthful fruits, that in after life enjoyment of them makes up a large part of home memories and endears to them, as much as any æsthetic or mental culture, those who have cared for their tender years.

SMALL FRUITS HERE AND THERE.

CHARLES A. GREEN.

SAMUEL MILLER writes me in glowing terms of the Triumph Grape. He does not say it is white, but leads me to infer that it is. While not an early grape, he thinks it will mature its fruit at Rochester, N. Y., if given a good position. "It is such a splendid variety I wish you to enjoy it, and shall send you a vine," he writes. At the Mississippi Valley Horticultural Society's Meeting, the Triumph was deemed the finest dish of grapes for table use on exhibition, the bunches weighing as high as one and one-half pound.

The Cuthbert Raspberry has been injured somewhat here by the severe freezing, but I trust not seriously. If it comes out next Spring with any live fruit buds I shall think highly of it, for this is the worst Winter for red raspberries I have known. They continued growing very late in the Fall, and the sudden dash of early Winter found them with immature wood. The leaves are hanging yet to raspberries that never retained their foliage so late before. The Cuthbert will not endure the severe Winters of Iowa and other points of the West. It is nowhere recommended as being so hardy as the Turner. Last Winter it went through without the loss of a bud with us. I am favorably impressed with this variety, but there is an opportunity yet for improvement in respect to complete hardiness. I predict that red raspberries in the future will be much more popular than in the past. People have been prejudiced against them on account of not knowing how to manage the suckers. Treat them as weeds, cultivate in hills both ways, and you will be successful; but cultivate only one or two inches deep. [We beg to state that this is our experience exactly.—Eds.]

I wish to bring about a reform in plant growing to this extent: Throw overboard half or more of the varieties of strawberries now on the lists. It is the worst possible waste of time and money to propagate or to plant a large number now recommended. "But we must publish a large list or we will be considered one-horse concerns," says one. I will reply that it is better to drive one horse and carry your friends safely, than to drive four-in-hand and dump them into the ditch. True, many varieties will thrive in one section, which should be discarded in another; but there are enough that will thrive almost anywhere, and such are the safest to recommend. There are scores of varieties of strawberries so nearly alike that one would require a microscope to distinguish one from another. Come, brethren, it is time to clear out the rubbish!

Visiting a large evaporating establishment recently, I inquired what method was found the best for keeping dried fruits from becoming "wormy." "We used to keep them in a dark room," was the reply, "but found that such a place was just the kind desired by the insects, and we lost some small fruits. We have since stored dried raspberries, etc., in very well lighted rooms, leaving as much space as possible between the sacks, and the result has been satisfactory."

The proprietors of the Niagara Grape have distinguished themselves for the Yankee shrewdness manifested in manipulating that variety. Without spending a dollar for advertisements they have made the grape known throughout the country; without disposing of their entire interest in one single vine, they have disposed of vineyard rights, bringing in, or promising to bring in—well I was told the exact amount, but will simply say somewhere into the hundreds of thousands of dollars. No living soul has the right to propagate a vine of this variety, nor will have until it is generally introduced to the public, which will not be for at least four years. When introduced it is proposed to attach the company's seal to each vine; therefore if any outside party had vines he could not sell them. One element of success the Niagara people have enjoyed from the beginning, without which no amount of ingenuity could have availed—they have a grape well-suited to the wants of the public, so far as can be determined by its conduct on the grounds of the originator. While not a variety of superior quality, it is good enough for market purposes, and not one in a thousand but will smack his lips over it. Its vigor, productiveness and beauty are its strong points.

THE GREGG RASPBERRY. —FIG. 112.

I am glad to see the originators of fine fruits rewarded generously. Few of them receive compensation in proportion to the benefits conferred. I met the originator of that valuable raspberry, the Doolittle, last Fall. He is a poor man, having made but a trifling sum from his seedling, whereas others made thousands of dollars.

I never have succeeded with fruits on low lands. The frosts in late Spring, when the fruits were in blossom, ruined fruits on the low lands, while those on elevations were injured but slightly in comparison. A difference of a few feet in elevation was often noticeable in the effects of frost. In young vineyards especially I have seen plants killed beside those unhurt, where the difference in elevation was but trifling. Elevation may or may not have been the controlling cause in this case. I asked Mr. J. J. Thomas recently whether the dwarf pears in the many orchards he had visited did better on the elevations than on the low lands. He replied, "Invariably better on the uplands." Messrs. J. H. and G. H. Hale speak of raspberries doing well on muck. I can do nothing with them, or with strawberries, currants, grapes, etc., on such soil. Our muck is too light, and lacks some essential ingredient.

The Lost Rubies Red Raspberry was planted last season in various parts of the country, and we shall soon hear reports of its conduct. With me it is the largest and most productive variety I have fruited, and it is very firm and beautiful. For five years it has borne heavy crops without Winter protection, and appears to be perfectly hardy. It possesses great vigor, the canes often growing six feet high. It ripens with Brandywine, and continues in bearing three or four weeks, depending on the season. This variety is not perfection, I hasten to add. Its greatest imperfection is, to my taste, being too tart; but I have noticed that this feature varies with the seasons and with different methods of cultivation. It was never so tart as last season. But, notwithstanding this defect, the quality of Lost Rubies is superior to that of most varieties, the flavor being pronounced and enticing—something among raspberry flavors as is the taste of a Spy or Spitzenberg among apples. I know of no variety that will yield so many quarts per acre, and none that the pickers are so partial to, owing to the rapidity with which they may fill their baskets. This is owing to its firmness. The cavity in raspberries comprises about one-third of the bulk. If the berries are soft and settle down solid, it takes a good many to

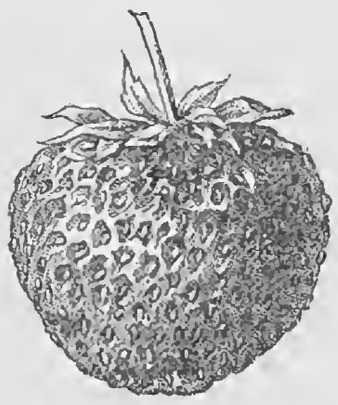
make a quart. It doesn't pay to grow soft berries. Mammoth Cluster is too soft. Gregg is much superior in this respect; but is inferior in quality.

The canes of Lost Rubies are similar to those of the Cuthbert; but the fruit is not at all like it. It has a closer resemblance to that of the Franconia, yet no one would take it for that variety. It is about the same size.

IMPORTANCE OF PRODUCING NEW FRUITS FROM SEED.

MARSHALL PINCKNEY WILDER,
PRES'T AMERICAN POMOLOGICAL SOCIETY.

THE widespread interest now manifested in the production of new varieties of small fruits from seed, induces me to comply with your request for an article on that subject. This is the most reliable method for obtaining new varieties suited to our various soils and climates, or as substitutes for those which may decline in the future. The acquisitions which have already been obtained give promise of still richer rewards to him who will work with Nature in compelling her to yield to his demands for still better results. She has placed in our hands the requisites for this purpose, and we have only to conform to her laws and we shall be sure of progress.



SENECA QUEEN.—FIG. 113.

The case with which new varieties may be obtained by crossing our best sorts of fruits, is now pretty well understood, and there is no better illustration of what can be accomplished than what has been done in the production of the numerous excellent native fruits which have been secured since the establishment of the American Pomological Society.

The importance of raising new varieties from seed is no longer of questionable utility. The fact that good seed of good varieties will produce good offspring is a fundamental law, proofs of which are seen in a multitude of instances from the results of artificial impregnation. Feeble parents produce weak children—a principle as well adapted to vegetable as to animal life. We have learned many of the laws which govern this most interesting department of science, and the more we work with nature in efforts for the improvement of our fruits the more we shall admire this most perfect and beautiful law for the improvement of men, animals and plants.

Fruits are a rich legacy to those who are to come after us. The man who originates a fine fruit that shall be adapted to general cultivation is a benefactor of his race, and his name shall be gratefully remembered long after he shall have passed from earth. Let us, then, persevere in developing these wonderful resources which Providence has placed in our hands. Persevere in our labors to produce new and improved varieties of fruits, and posterity will bless our names for the good we have done. Persevere in these praiseworthy pursuits, hoping that the time may come when every one throughout our vast territory may be in the possession of these blessings; when our hill sides shall rejoice in the burden of the vintage, our valleys teem with the golden products of the orchard, and fine fruit. "the most perfect union of the most useful and beautiful that the earth knows," crown in abundance the table of every inhabitant of our beloved land.

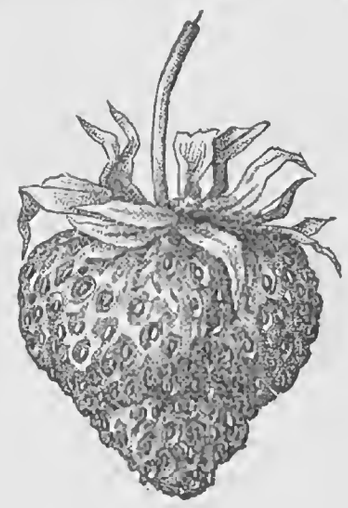
PHOTO-MARTHA.—FIG. 114.

STRAWBERRY CULTURE AND ITS PROGRESS.

DR. F. M. HEXAMER.

Depreciation in Prices.

IN 1872, the strawberries shipped from Charleston to Northern markets brought an average price of 57 cents per quart; in 1876, 38 cents; in 1877, 21 cents; in 1879, 14 cents; and last year, 12½ cents per quart. Jucundas from the Knox Farm at Pittsburg brought, in years gone by, from 50 to 75 cents per quart at wholesale; and, for several years after the war, first-class Triumphs and other large varieties sold readily for 40 and 50 cents per quart, by the crate, while now the very choicest would not bring half as much. This decline in

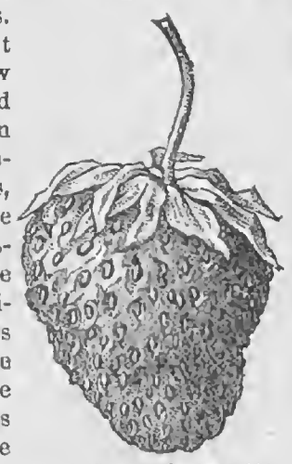


BIDWELL NO. 1.—FIG. 115.

prices is, of course, mainly caused by the larger quantities of berries raised; but there is another important factor which causes the present low prices for first-class fruit. In former years, when our selected Jucundas and Triumphs came to market, the only competition they had to encounter was from small Scotch Runners or sour, sandy Wilsons, and the contrast was so great that buyers paid willingly three and four times more for the best. But now, owing to the rapidly increasing competition and the great improvements in new varieties, poor berries can hardly be sold at any price, and the average market fruit has improved so much that there is but little difference between them and the choicest. and here, as in other trades, a plentiful supply of cheap goods depreciates the value of the better grades. The most important

Revolution in Strawberry Culture,

however, so far as concerns the grower, at least, has been effected by the changing of our markets. The market centers for fruits, as well as other goods, are rarely permanent; they are frequently moving from one place to another, or changing in their respective locations. Many of the prominent business houses in New York have changed several times within my recollection the locations of their stores, have moved with the migration of their customers, or they have transformed their business in such a way as to conform with the altered conditions. The Strawberry market is not exempt from these fluctuations of trade.



BIDWELL NO. 2.—FIG. 116.

A few years ago, New York was the great distributing center of berries for hundreds of miles along every railroad and steamboat line entering the Metropolis; but now the markets of most inland towns and large villages are supplied with home-grown fruits, and only an inconsiderable amount of berries is re-shipped from New York. Thus it happens that while the demand for products of nearly all kinds has largely increased during the last years, the amount of berries disposed of in New York has decreased somewhat; and while the producers of wheat and corn, of butter and cheese, of beef and pork, and many other farm products find, at home and abroad, new and profitable outlets for their bountiful crops, the small-fruit grower who depends on the New York market finds the demand for his products diminished instead of increased, and, naturally enough, wonders where that much-talked-of national prosperity may be found.

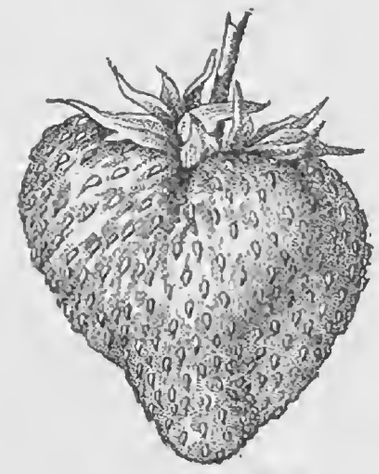
Some people are constantly complaining that "business is overdone," that "times have changed," and so they have. We cannot reverse the order of the universe. Times do change, and unless we change with them we have to go under; everything changes with every year, with every day, with every moment—commercial relations, seasons, vegetation—the earth itself has changed from vapor into solid matter, and will continue to change till the end of time. Without change there is no motion; without motion there is no life; inertia is death. How can *we* expect to remain at a stand-still when everything around us moves?

BRILLIANT.—FIG. 117.

It would be to little purpose to attempt to give here specific directions for the culture of strawberries. In fact, I think one of the most decided additions we have made to our stock of practical science consists in the knowledge that but few, if any, rules can be laid down which are equally applicable to all conditions and in all localities. Each one has to observe and study his own markets, his own soil, and the varieties, fertilizers, and cultivation best adapted for the same. We have to practice what observation and experience have taught us. The keenest observers, and those who can draw the most correct conclusions from their experiences, and will apply them judiciously, are always the most successful.

Fertilizers.

Of scarcely less importance to the strawberry grower is the proper selection and application of fertilizers. How and from what to reap the best returns for the money invested is, and always will be, the leading problem. There are, no doubt, many who know that bone-dust is best; others have used stable manure with success, and want nothing else; and still others may be sure that there is nothing better than a certain special Strawberry Fertilizer. All may be right and showing their good sense by continuing what they have found to be good and profitable; nevertheless,



MARVIN NO. 1.—FIG. 118.

should they change places with each other, some would probably soon modify their practices somewhat. Careful observation and extensive experiments have convinced me that the strawberry plant is not only a glutton, but an epicure at the same time; that it is not satisfied with an abundance of the richest food—it also insists upon having it prepared in the most palatable manner, served in the most dainty style and as often as it feels inclined to partake of it. Of course, you can force and starve it to exist on almost anything rather than die; but if you want it to put on its sweetest airs, to be pleasant and have rosy cheeks, and do its best generally, it must, like other pets, be coaxed and petted.

Now, wherever you keep your pets, be it North or South, on sandy plains or on heavy clay hill-sides, there is one decoy to which they respond every time and without fail, and this is a good, well-decayed compost. Whatever the fertilizer to be used consists of, composting increases its strength, enhances its value, and prepares it for the immediate needs of the plants. I do not wish to be understood as underrating the value of stable manures or of special fertilizers, some of which are among the crowning triumphs of scientific agriculture, but I do assert that practice, as well as theory, has proved that however effective either alone may be, combined they become often doubly valuable.

It is a great mistake to use commercial fertilizers only to lengthen out the supply of stable manure; much better results may be obtained by composting all the available manure with all the purchased fertilizers,—mixed with sufficient muck or soil to prevent too violent fermentation,—and to distribute the entire bulk over all the land to be cultivated. We all know that in seasons of severe drought ordinary fertilizers rarely produce the desired results, and that too much rain carries a considerable part of the fertilizing matter below the reach of roots; composts, however, by reason of the minute division of the active principles contained in them, are immediately available as plant food, and by being evenly scattered over the surface, benefit all plants alike, and become absorbed in a shorter time than raw fertilizers.

WINDSOR CHIEF.—FIG. 119

To obtain the best results from compost, it is advisable to divide the quantity to be used during the season into several parts, and to apply them at different intervals instead of using them all at one time. In feeding our horses we are careful to give them all they will eat up clean at one meal, and no more, else a part of the fodder becomes wasted and useless, while with judicious feeding, nothing is wasted, and all the provender goes to strengthen the animal. The same principle underlies the system of feeding plants. I will not enter into the details of preparing compost heaps, but I am sure that any one who will give composted fertilizers a fair trial will soon become convinced of their great value in strawberry culture. What ready cash is to the tradesman a good compost heap is to the strawberry-grower. As the merchant who has ready cash is better prepared to strike an advantageous bargain when opportunity offers than one who has to wait till money comes in before he can buy, so is the fruit grower who can rely on his compost heap in some measure independent of weather and seasons; he can count on its good results every time.

GLENDALE.—FIG. 120.

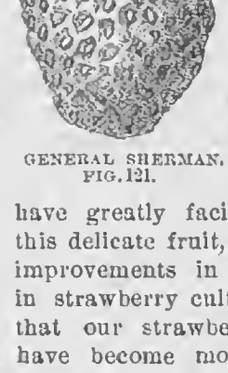
Irrigation

is attracting much attention now. We can hardly call it new, for the Egyptians practiced it to perfection more than four thousand years ago, and at the present time extensive systems of irrigation are found in Italy, Spain, India and many other countries of the Eastern Hemisphere. Except in California, we have made only a few isolated attempts in irrigation, but wherever tried systematically it has proved eminently satisfactory. The time cannot be far distant when we shall become enlightened enough to utilize the immense stores of fertility contained in our mountain lakes and streams, which are now permitted to flow into the ocean.

The use of potted plants has likewise become more general, and as an article of trade they are already of considerable importance. For the amateur, and especially in cases where Spring planting is not practicable, potted plants have certainly much in their favor.

Extension of Strawberry Culture.

It is but a few years since strawberries were considered a great luxury, to be indulged in only by the wealthy who could employ professional gardeners, skilled in the mysteries of their culture. Improvement and progress have dispersed these antiquated notions, and have placed a strawberry-bed in the garden of every right-minded person. While many may remember the time when strawberries were hardly known as a luxury even, it would be difficult to find now a comfortable home in city or village, or on the farm, where strawberries do not constitute an indispensable part of at least one meal a day during the season. It is true that improved means of communication and transportation have greatly facilitated the distribution of this delicate fruit, but were it not for the improvements in strawberries and progress in strawberry culture, could it be supposed that our strawberries of the past would have become more disseminated than they were then? It is only through the wonderful progress in cultivation and improvements by hybridization that the strawberry has reached its present commercial importance. Statistics show that the value of strawberries sold annually in our large cities amounts to many millions of dollars, but the priceless value in enjoyment, in good cheer and health to the millions who grow, pick and eat their own berries, is incalculable. With the planting of every strawberry-bed on a farm where there was none before, the corner-stone is laid for a happy home; for every plant we intrust to the soil bears in it the germs for happiness and health. Would we know where the strawberries grow, let us drive along the country road to yonder cozy cottage, where the rosy cheeks and bright eyes, the happy faces and cheerful expression of the children playing under the rose-covered veranda, tell, more plainly than words can tell, that the strawberry-bed is not far away.



GENERAL SHERMAN. FIG. 121.

Benefits of It.

But progress in strawberry and other fruit culture has accomplished more than to invigorate health, increase our enjoyment and endear our homes to our children; it has sharpened observation, brightened thought, and inspired the development and stability of the noblest traits of human nature. No plainer object lesson was ever taught, no more impressive sermon preached, than that which Nature has instilled in every root, in every leaf, in every expanding bud and every fading flower which must wither that the more perfect fruit may spring into life.

CINDERELLA.—FIG. 123.

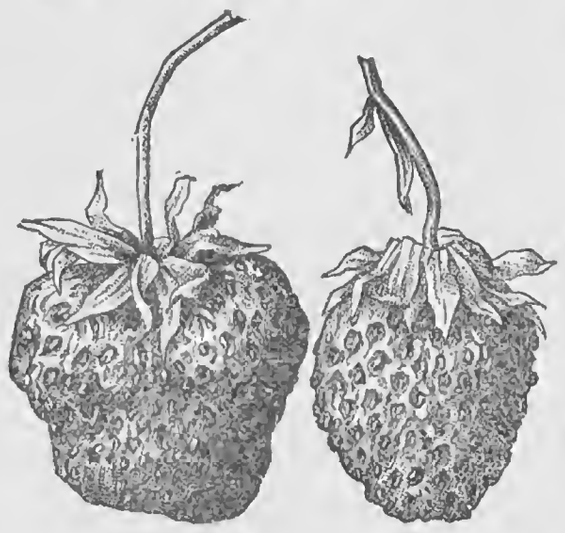
There is a class of people who do not believe in progress, who think the world had reached perfection when they were young, and that it has gone backward since. But who could, 50 years ago, have imagined the wonderful progress of the present day, and who can conceive what progressive ideas and progressive minds and progressive men will accomplish in another half century? We may at times go too fast and make missteps, or we may put on too much steam and burst a boiler, but what of that?—what does the brave soldier care if he must lose his life that his brothers may march to victory?

He who does not believe in progress is the most virulent sore on the body of the community, the most dangerous enemy to society, the state, and mankind; far better that he should perish than impede the wheel of progress.

SMALL FRUITS IN ARKANSAS.

DR. JOHN A. WARDER.

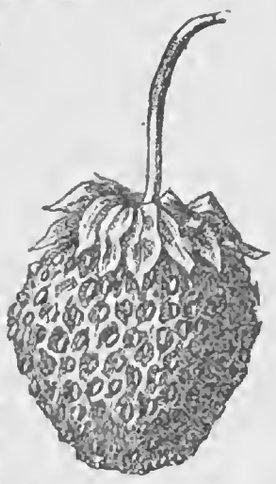
ATTENDING a recent meeting of the State Horticultural Society at Little Rock, the capital of Arkansas, it was pleasant to find so energetic a band of intelligent fruit-growers assembled. All were earnest and enthusiastic respecting the new industry which here, as elsewhere, follows close upon the heels of the iron horse, whose snorting career, though appalling to the coyote, the bear, the bison and the deer of the primitive regions, is always accompanied by the more gentle and useful animals of domestic and civilized life as the assistants of terra-culture.



SHIRTS.—FIG. 123. SHIRTS.—FIG. 124.

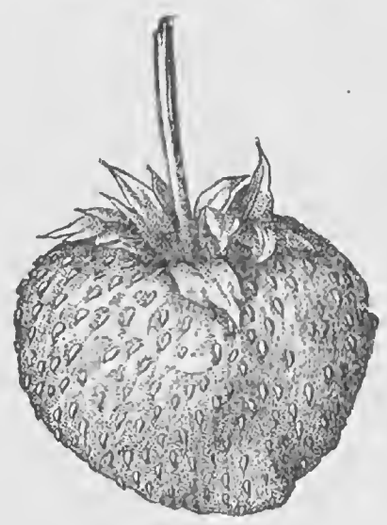
To one who had visited this region in days long past—say 1850—when access could only be had by steamboats along the rivers, it was most natural to draw a comparison and to observe the contrast in the surrounding conditions. King Cotton still bears sway in the lowland regions, and the long-leaved pines still wave their plumed tops on many of the uplands; but in all favorable sites, farms with mixed agriculture and fruitful orchards are asserting their claims to attention, and are evidently yielding satisfactory results to their owners. The very capital itself, from being a quiet cluster of elegant residences for the owners of the great cotton plantations along the rivers, has become a busy mart of trade, a thriving rail-road town in constant communication with the outside world, and contributing liberally of luxurious fruits to distant markets. Of these, the small fruits, especially the strawberry and the peach, seek the Northern cities by way of St Louis, while the famous apples may find a ready demand southward in Texas and Louisiana.

The attendant members of the Society were evidently encouraged by their success in fruit-growing and appeared to be quite well posted as to the best varieties, with which they appeared to be as familiar as we of the older Societies in the North. I heard constant and high praises of their great "Fruit Belt" and on inquiry as to its limits, was informed that it extended across the State along the line of the St. Louis, Iron Mountain and Southern Railway, from Poplar Bluff in Southeastern Missouri to the southwestern corner of the State near Texarkana on the Red River, especially for the fruits already named and for grapes in several places where they have already been planted, while apples and peaches succeed in all the upland regions of the northwestern quarter of the State, and pear trees have thriven in the southern parts since the early settlements made by the French, who also introduced the fig, and trained the native Muscadine or Scuppernong Grapes on their primitive arbors. This is still the favorite method of training these peculiar grapes.



ENDICOTT'S SEEDLING. FIG. 125.

The happy geographical range of this region, with its fertile soil and its fortunate climatic conditions, would seem to promise the best results for horticultural efforts. The latitude gives early products for the supply of Northern markets, while, in the elevated regions, where the apple thrives so admirably, there need be no lack of demand to the south and southwest, in Louisiana and Texas, where this noble fruit cannot be produced, and where a



MARVIN.—FIG. 126.

constantly increasing population stands ready to consume all their surplus and, like Oliver, ask for more.

THE BIDWELL AND OTHER NEW STRAWBERRIES, NEW RASPBERRIES, ETC.

E. P. ROE.

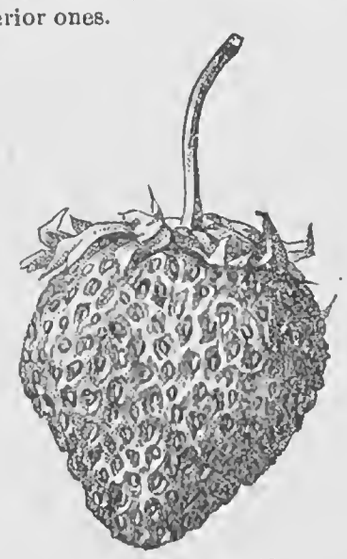
EVERY year I grow more conservative and less ready to drop the old standards for highly-praised newcomers. At the same time I believe we are destined to see a steady advance in the good qualities of the several small fruits, brought about by the efforts and discriminating observation of the many intelligent men engaged in their propagation and culture. The standard is now so high and the knowledge of good sorts so general that a worthless variety stands little chance of dissemination. Certainly no honest man ought to send out a fourth or fifth-rate novelty. There is one point on which the best informed are liable to error, and that is, the power of a given variety to thrive in different and widely separated localities. In this respect even I have learned that there are several very safe principles for our guidance. Parentage has an influence over a variety, which can never be eradicated or wholly overcome. As a general rule, we can affirm that to the degree that a variety of strawberry, raspberry, etc., contains foreign blood it will fail in southern latitudes and under a hot sun. For the people of the lower latitudes to condemn such varieties is just as absurd as it would be for us to condemn figs and oranges because we cannot grow them. On the heavy soils around Cleveland, Ohio, I am informed that the Jucunda proves one of the most profitable kinds that can be raised. On the light land of New Jersey and farther southit is a flat failure, except in some soils peculiarly favorable. Take the country over, it can be laid down as a safe practical truth that the varieties best adapted to general culture are those which spring from our robust native species—the Fragaria Virginiana or Rubus strigosus, etc.

Suppose the origin of a kind is obscure and the character of its parents cannot be learned, what then? Simply this—we must test the new candidate. Having once thoroughly made himself familiar with the marks of foreign parentage, an experienced fruit-grower can soon discover them in any newcomer. There will be a certain odor in the fruit, a tendency of the foliage to burn in Midsummer, and other distinctions which will not escape the practiced eye. Chief of all a feeble or fastidious kind will not thrive on a light, thin soil, no matter how far north it may be planted. I have only to set out a newcomer on the thinnest and lightest soils of my place in order to guess very correctly whether it will thrive in New Jersey and farther south. It was my ignorance of these principles which led me to send out the Pride-of-the-Hudson Raspberry. It bore the most beautiful fruit that I have ever seen anywhere, and Mr. Wm. Parry, the veteran fruit grower of New Jersey, after examining the bushes and measuring the berries, ordered five hundred plants on the spot and that, too, when they were held at fifty cents each. A riper and costly experience proved that, although it originated in this country, it was a child of the Antwerp and essentially an Antwerp in character, and I stated the fact in my catalogue as soon as I discovered it. I believe it would thrive well in England.

Is the Bidwell Strawberry destined to thrive North and South, East and West? I honestly believe that it is; for, during the last hot and singularly dry Summer, it showed a hardiness and vigor unsurpassed by any other variety on my place. I have tested it for two years on my driest as well as heaviest soils, and it appears to ask only half a chance anywhere. I also know that it has thriven on the light soils of other growers. I have never seen the slightest tendency to burn in its foliage, and it bore such enormous crops of very large, delicious bright-colored berries that I am led to believe it more valuable than the Sharpless.

At the same time it ripened so much earlier than the Sharpless that it will not interfere with that berry as a market kind. I am proving my faith by planting it more largely than any other variety. And yet, in spite of my sanguine hopes and beliefs, I distinctly state that it is a novelty untested as yet by the breadth of the continent. He is dishonest or else very ignorant who claims that an untested variety is certain to succeed in general cultivation. Mr. Berckmans, of Georgia, proved what a sound horticulturist he was by saying that he would not give a final and unqualified opinion as to a fruit until after ten years of trial.

The Bidwell is a novelty, but it is indorsed by a man so thoroughly worthy of respect as Mr. T. T. Lyon, who introduced it to the public, and I have been so strongly impressed with its value that I have bought all the plants he has for sale.* We should also remember that all the standard varieties we now have were once novelties, and that the money was made by those most prompt to recognize their value, and to plant them. A pint of first-class berries brings as much as, and often more than, quarts of inferior ones.



PRIMO.—FIG. 127.

THE OLIVER GOLDSMITH is a competitor in my grounds with the Bidwell, and I have been so much impressed by its value that I have bought the entire stock from the originator. I shall have more to say concerning it after another year of fruiting.

THE TRIPLE CROWN is one of the most distinct and delicious varieties on my place, but while it is exceedingly vigorous with me, its fruit indicates a foreign origin in part.

THE WARREN I recommend, but not the Longfellow, the latter being poor in flavor and a feeble grower.

THE SHARPLESS did admirably with me last year, but, like all of our large, showy kinds, it is not adapted to thick or matted culture.

THE SHIRTS impresses me very favorably, but I have not fairly fruited it yet.

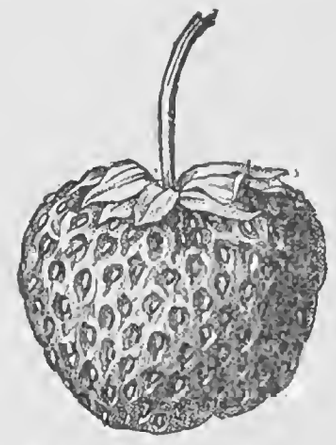
SHIRTS.—FIG. 128. SHIRTS.—FIG. 129.

THE MARVIN is a very fine, firm, late berry, but resembles the Jucunda so closely in its requirements and habit of growth that I am almost certain it will not succeed in the South or on light soils.

RED JACKET I have found one of the most promising of the new early berries. Although I have an endless quantity of plants I do not recommend Crystal City at all, except for the one quality of extreme earliness. I think it is the earliest berry we have. Of the old standard varieties, the Chas. Downing, Champion (Windsor Chief), Duchess and Kentucky are taking the lead. In regard to the

CUTHBERT RASPBERRY, I share in the opinion once expressed to me by Mr. Chas. Downing—that it is the best for general cultivation. From the first I was so sure of its value that I paid a large bonus, in addition to the price of the plants, to obtain stock that I could trace directly to Mr. Cuthbert's garden. I also obtained some plants from the original patch in the garden where it originated, and have made these the standard by which to test my stock; for it is of great importance that a variety destined to have such a wide popularity should be sent out unmixed, by all propagating it. Side by side with Mr. Cuthbert's plants I have grown the Queen of the Market for two years or more, and I fail to see, even under the microscope, the slightest difference between them. [Mr. Parry still offers them as distinct.—EDS.]

THE GREGG I consider a decided acquisition. It is somewhat larger and a little later than the Mammoth Cluster and so prolongs the season. This variety was originally sent out very much mixed, and much loss and disappointment will no doubt occur from this. The true Gregg is a distinct and uniform berry and when once known will maintain its place and superiority. I cannotsee wherein the



HUDDLESTON'S FAVORITE.—FIG. 130.

WESTERN TRIUMPH AND SWEET HOME, as I have received them, differ from the Gregg. My specimen beds put an end to many an argument among my horticultural visitors. When no distinctions can be observed between two so-called different kinds grown side by side under precisely the same conditions, nature settles the question. The productiveness of my

SNYDER BLACKBERRIES excited the astonishment of all who saw them last Summer, and this variety certainly competes equally with the Kittatinny for the home garden. Taylor's Prolific promises exceedingly well, but I do not regard the Wachuset Thornless as worthy of cultivation.

I have given in the above the result of some little observation and outlines of my own experience. After the fruitage of another Summer my mind will be much clearer in regard to many kinds now on probation. I believe we shall ever attain our best success by a docile subserviency to the teachings of nature. If she is on our side we cannot be wrong, and the most eminent authority cannot be right if she declines indorsement. My plan is to accept her decisions promptly, even though some of them are entirely contrary to cherished hopes and desires.

Cornwall-on-the-Hudson, N. Y

* It is but just to state that other dealers have the Bidwell for sale.—EDS.

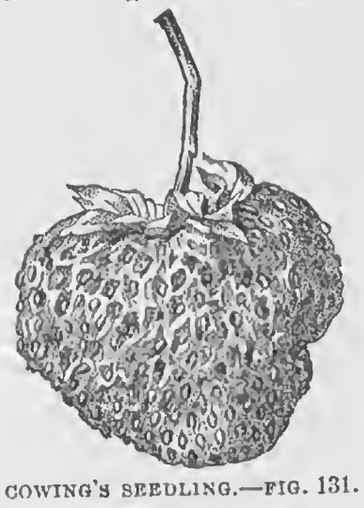
ANNOUNCEMENTS OF CATALOGUES FOR 1881 RECEIVED UP TO DATE.

The RURAL NEW-YORKER *begs to state that it will announce the Catalogues of all reputable seedsmen, nurserymen, etc., as they are received. Readers are referred to our advertising columns for particulars not stated under such announcements. It is plainly desirable on all accounts that our readers, in sending for such Catalogues, should mention the* RURAL NEW-YORKER. *This should insure due attention to their requests, while it seems an act of respectful appreciation of this journal. In future issues, we shall take pleasure in referring to specialties offered in the Catalogues received, respecting which our readers have made inquiry.*

ELLWANGER & BARRY, Rochester, N. Y. Descriptive Price List of Strawberries and other Small Fruits. Sent free to our subscribers.

E. P. ROE. Cornwall-on-the-Hudson, N. Y. Spring Catalogue for 1881 of Strawberry and other Small Fruits and Grape-vines. This catalogue, like Mr. Roe's beautiful work "Success with Small Fruits," invests the usually routine language of such publications with the interest of a well-told story. This will be mailed to our subscribers without charge.

ELLWANGER & BARRY, Rochester, N. Y. A Descriptive Catalogue of Select Roses, with a



COWING'S SEEDLING.—FIG. 131.

beautiful colored plate. Among the praiseworthy and new features of this catalogue we may mention that the names of the raisers; the year when the varieties were sent out, the parentage of the varieties, are given. This will be sent to our subscribers without charge.

D. M. Ferry & Co, Detroit, Mich. Seed Annual for 1881. This is a remarkable catalogue—considering that it is mailed to applicants without charge. It contains five colored plates, 500 engravings, 170 pages and a list of 1,500 varieties of vegetable and flower seeds and plants.

A. J. Caywood & Son, Marlborough, Ulster Co., N. Y. A Pamphlet of the new white grape Duchess, and two new strawberries.

V. H. Hallock, Son & Thorpe, Queens, Long Island, N. Y. Catalogues of plants, bulbs, &c. Free. This firm cultivates 30 acres of flowers and has made for many years a specialty of the beautiful Gladiolus of which they have an immense stock.

Ellis Bros., Keene, N. H. Illustrated and Descriptive Catalogue of Greenhouse & Bedding Plants for 1881. We see in this a picture of the new double white Bouvardia, "Alfred Neuner," illustrated in the Rural of Feb. 19.

Frank Ford, Ravenna, O. Descriptive price-list of Small Fruits, Seed Potatoes and certain specialties.

T. M. Metcalf, Prop. of the North Star Seed Farms, St. Paul, Minn. Annual catalogue of choice field, garden and flower seeds grown by them and selected from the stocks of the best American and European growers. A large, illustrated catalogue. Free to all.

Waldo F. Brown, Oxford, Butler Co., Ohio. Fifteenth Annual Catalogue of flower and vegetable seeds. Mr. Brown is an able rural writer and an experienced farmer and horticulturist. He offers his catalogue without charge to all who apply.

C. W. Dorr, Des Moines, Iowa. Seed Manual for 1881—also a fine list of the best small fruits. Free.

Geo. S. Wales, Bannockburn Farm, Rochester, N. Y. A Treatise on Strawberry Culture. The whole story told in a few words. This is sent "free" for a penny stamp.

United States Wind-engine and Pump Co., Batavia, Ills.—Descriptive Catalogue of 50 pages of standard wind-mills, double and single-acting pumps, the IXL feed grinders, Halladay's celebrated outlet valves, hay carriers, horse-hay forks, etc. Fully illustrated. Free.

Bowker Fertilizer Co., No. 43 Chatham St., Boston.—No. 3 Park Place, New York. Pamphlets of the Stockbridge Manures and Bowker's Hill and Drill Phosphate. All are invited to send for them.

The Dingee and Conard Co., West Grove, Chester Co., Pa.—The New Guide to Rose Culture and list of all desirable Roses—72 pages. Probably the largest establishment of the kind in the world. Roses by mail a specialty.

A. B Barnes, 46 and 48 West Lake St., Chicago, Ills. Annual Catalogue of Farm Machinery, Field, Garden and Flower seeds—illustrated, 68 pages. Free to all.

Ellwanger & Barry, Rochester, N. Y. Descriptive Catalogue of Ornamental Trees, Shrubs, Hardy Perennial plants, etc. 120 pages—illustrated with many new engravings and a colored plate of that fine shrub the Japan Snowball—Viburnum plicatum.—Also

A Descriptive Catalogue of Fruits with a colored plate and wood cuts—65 pages.—Also

A Descriptive Catalogue of Select Roses with a beautifully executed colored plate of those superb varieties Coquettes des Blanches, Jean Liabaud, Jules Margottin, Alfred Colomb and Marie Van Houtte, all Hybrid Perpetuals except the last which is a Tea.

A. C. Kendel, 115 Ontario St., Cleveland, Ohio. Price-list of native and imported Field, Garden and Flower seeds, Agricultural Implements, etc. Free.

Nash & Brother, 22 College Place, New York. Descriptive Illustrated Catalogue of the Acme Pulverizing Harrow, Clod-crusher and Leveler, 50 pages. Free.

Peter Henderson & Co., 35 Cortland Street, N. Y. Combined wholesale list from February 1st to March 15th. For florists and market gardeners.

Storrs, Harrison & Co., Painesville, Ohio. Catalogue of 80 pages with a handsome colored plate of carnations. New or rare plants, bedding and house plants, vines, roses, geraniums, fuchsias, etc., etc.

Also, semi-annual price list of fruit and ornamental trees, vines, evergreens, shrubs, etc.

Also, catalogue of grape-vines, strawberries and small fruits in general.

Also, pamphlet of "Dollar Collections" of fruit trees and small fruits of all kinds. Free to our subscribers.

L. W. Godell, Amherst, Mass. Illustrated catalogue of seeds and bulbs for the flower and vegetable garden. Free.

E. & O. Ward, Produce Commission Merchants, 279 Washington St., N. Y. A circular of instructions to shippers. Advice as to packing, shipping vegetables, fruits, etc, etc. This will be mailed free to applicants, and it offers some valuable suggestions.

E. & J. C. Williams, Chestnut Hill Nursery, Montclair, N. J. Catalogue of strawberries, raspberries, grapes, fruit trees, etc. Free to all. A trustworthy establishment. They recommend Charles Downing, Sharpless and Miner's Prolific as the best strawberries and recommend all to try a "dozen each of Caroline and Cuthbert Raspberries." They think highly, also, of the Brighton Grape.

T. S. Hubbard, Fredonia, N. Y. Catalogue of Grape-vines, Fruit Trees, etc. Headquarters of the new and promising Prentiss Grape. Sent to those who apply.

W. L Ferris, Jr. Poughkeepsie, N. Y. Catalogue of 26 pages illustrated. Vegetable and flower seeds, small fruits, &c.

William Parry, Parry P. O., New Jersey. Catalogue 35 pages illustrated. Strawberries, blackberries, grapes, currants, gooseberries—fruit and ornamental trees. Free to all.

Also, Catalogue of 32 pages of plants and flowers.

B. K. Bliss & Sons, 34 Barclay St., New York. A Select List of Novelties for 1881. Fine illustrations of peas, melons, new potatoes, new varieties of grain, &c. This is an interesting document and will be sent to our subscribers without charge.

Thomas Meehan, Germantown Nurseries. Philadelphia, Pa. Catalogue of 34 pages of all kinds of ornamental trees, shrubs and fruits. Also seeds of trees, shrubs and fruits. An excellent list—an old establishment and an experienced proprietor.

RURAL BRIEFLETS.

A deep, moist (not wet) fertile soil is what pleases the currant. For fertilizers, bone flour, wood ashes, muck, leaf-mold, cow manure may all be advantageously used. In sandy or dry soil, a mulch of salt hay, grass spread while green, corn-stalks or coal ashes will prove of decided value. Further south, shade must be given to the currant—such as that afforded by the shelter of barns or other buildings. . . . . .

In the field culture of the currant it is best to set them so that they may be cultivated both ways, viz., five feet apart. A shallow cultivator only should be used. An acre so planted would require about 1,500 plants. For this purpose select one-year-old plants. . . . .

The old Red Dutch is at once the most productive and the best in quality of any of the well-known varieties. To what extent Fay's Prolific may be an actual improvement upon this can only be determined after several years of trial in many different places. Give the Red Dutch a suitable soil and care, and the berries will be nearly as large as those of the Cherry and Grape Currants—while it will yield more fruit of a better (less acid) quality. . . .

The "White Grape" is perhaps the best white currant. "Victoria" ripens about two weeks later than the others. The berries are red, of fair quality, and produced in abundance. It is growing in favor among marketmen because it is late and also because it is a good shipper. The Cherry or Versaillaise is the largest of currants and, all things considered, is to-day the most popular. The berries are of a fine, liquid crimson-color, though very sour. . . . . .

The Black Naples is the best black—unless it may be Lee's Prolific, of which the Rural has no personal knowledge. See Mr. Lovett's remarks. . . . . .

The best varieties of American gooseberries are Downing, fruit large, soft, juicy, good; of a light-green color; plant strong and prolific; Houghton's Seedling, strong grower, productive, medium-sized fruit, pale or red color, tender and good; Smith's Improved, strong grower, fruitful; berries, pale yellowish-green, firm, sweet, of an oval shape and large; Mountain Seedling, large fruit, productive; red, thick skin; fair quality. . . .

Sugar and hot water, tansy or lime-water are recommended for ants among strawberries. .

Mr. Harvey had the grape fever very badly about 25 years ago. During its paroxysms he planted 150 varieties. He has since rejected 147. . . . . .

Mr. Josiah Hoopes thinks that country people should be able to recognize the honorable agent from the rascal. Mr. Engle thinks that people love to be humbugged and he would let the matter work out its own cure. Mr. Meehan, who has been in the nursery business for 25 years, thinks there are cases where agents do good as well as much harm. There are many instances where trees would not be planted at all, if not for the agents. There are scores of nurserymen who employ only honest men. In his vicinity agents sell to people who never come to the nursery, and who pay more because they are waited upon. . .

Mr. Ohmer, of Ohio, states that the Snyder Blackberry is really iron-clad. It seems to resist, he says, everything known as injurious to other kinds. It will stand 30 degrees below zero and come out all right in the Spring. It is an enormous bearer of not large, though pretty good fruit. . . . . .

Mr. Geo. S. Wales says, "Strawberry culture, in the fewest words, is to select varieties

THE NIAGARA GRAPE.—FROM NATURE.—SEE PAGE 161.—FIG. 132.

suitable to the soil and to make and keep the soil rich, mellow and free from weeds." . . . .

THE Belle de Fontenay is an uncertain variety, thriving well only here and there. But its fruit is so delicious that one may afford to take a heavy risk. The berries are large, dark red, firm and possessed of what we should describe as a perfect raspberry flavor. It is worth bearing in mind that a crop of Fall berries may be produced by cutting back the canes in the Spring. The berry is of an irregular shape and the plant suckers quite too freely. . .

AFTER writing our brief instructions as to "planting strawberries in the garden," we had occasion to refer to Phillip Miller's "Gardeners' Dictionary," a ponderous work published in England in 1759, and again referred to on our editorial page. Thus we find that methods since then are in many cases surprisingly unchanged. We there find:

"The usual method is to lay it out into Beds of four Feet broad, with Paths two Feet broad between each; thefe Paths are neceffary for the Convenience of gathering the Fruit and for Weeding and Dreffing of the Beds; after the Beds are marked out, there fhould be four Lines drawn in each at a foot Diftance, which will leave fix Inches Space on each Side, between the Outside Rows and the Paths; then the Plants should be planted at about a Foot Diftance from each other in the Rows in a Quincunx Order, being careful to clofe the Ground to the Roots of the Plants when they are planted"—etc. . . . . .

ELLWANGER & BARRY say that the Thwack Raspberry is large, red and insipid, which tells the true story in the fewest possible words. They might have added that it is the worst berry to sucker known.

MR. HENDERSON praises Durand's Glossy Cone Strawberry as the first among seventy kinds in his grounds. He says it is the earliest of all, prolific, of good size and fine flavor. We have not tried it. . . . . .

MR. LOVETT entertains hopes that the Pocklington may prove a better grape "for the million" than the Concord. We trust it may not prove so hard a task to eclipse the Concord among grapes as it does to eclipse the irrepressible Wilson's Strawberry.

MR. T. T. LYON was astonished to hear the Thwack Raspberry so highly lauded at the last meeting of the American Pomological Society. We were among the first to test this raspberry. Though very firm and of good size, it is as nearly destitute of the flavor as a raspberry well can be, and so we stated three years ago. We cannot suppose that those who have eaten the Thwack can truthfully say one word in its favor as to quality.

THE following anecdote as told by Mr. J. T. Lovett, is very amusing to us and we trust it may so prove to our readers.

"One morning in the hight of the berry season (and every fruit grower knows what a time that is for rush and hurry) a dapper young man presented himself at the office, and said he would like to look at the berry "plantations." I conducted him thither, when he commenced to dispense his knowledge of berry culture with great freedom. He asked: "Well, aw, how many brands of strawberries have you?" To which I replied, "Something over a hundred and fifty." "Well, aw, and what are the names of them?" I knew it to be a task, but the question being a direct one I commenced to name them, going over the list as one would the alphabet. I had not named more than a half-dozen, however, when I was interrupted to be told that he, too, had quite a collection. Supposing, by my experience, that he wanted me to ask how many he had, and their names, I did so. "Well, aw," he remarked, "I have, I think, *three*; one, I think, is called the Wilson; the name of one I cannot remember, and the other is called Mammoth of the West," adding, "that is a good *brand*, isn't it?" Recognizing Monarch of the West as the variety referred to, I told him it was one of the standard sorts and much esteemed by many. "Well, well, aw," he continued, "I suppose you are constantly *hybridizing* new varieties by *grafting*, etc." The last I saw of him he was explaining with his soft "R's" to my foreman that the best way to propagate the grape was by seeds and by root cuttings." . . . . . .

PROFESSOR GEO. HUSMANN says: "The day may not be so far distant, when the despised grape of North America will become the only hope of the failing grape-growers of all nations." . . . . . .

THE strawberry—or rather small fruit—catalogue of Messrs. Ellwanger & Barry, gives short, pithy descriptions of the kinds named in what seems to us an eminently trustworthy manner. It seems to have no pets, and the desire is apparent that each variety should rest upon its own actual merits. For example, in speaking of the Great American it says, "said to do well in some places." Of the Pioneer it says, "foliage burns some"; of the Cumberland Triumph, "too soft for shipping long distances"—and so on through the list. . . . .

A LIST of strawberries agreed to by the late Kentucky Hort. Meeting, for succession, family use, etc., for that State was:—Warren, Longfellow, Cumberland Triumph, Sharpless and Kentucky. . . . . .

NEW GRAPES.

GEO. W. CAMPBELL, DELAWARE, OHIO.

THERE has probably been no time in the history of American grape-growing, when there were so many new grapes presenting their claims upon public attention, as at the present time. And the most remarkable and interesting feature in the case is, that so many of them appear to have real merit, and to indicate substantial progress in the way of improvement.

To one who can remember when the Isabella, the Catawba and the Clinton were the only varieties in the catalogues or generally known to cultivators, the exhibition the past Autumn at the meeting of the Mississippi Valley Horticultural Society at St. Louis, of 249 distinct kinds of native grapes seems almost marvelous. And they were not all there, either; for some of the most promising of the new sorts were conspicuous by their absence.

When the number is so great, it will be impossible in the brief space of a newspaper article, to notice more than a few of the newer kinds which appear most promising and worthy of attention.

The two classes of grapes presented most prominently for our consideration are, natural, or chance seedlings, and hybrids or crosses with native and foreign varieties, or between our improved native kinds.

I am obliged to say, after many years of observation and experience in raising hybrid grapes and in testing those of others, that all our hopes and expectations have not been realized; and although some of the most beautiful as well as the most excellent grapes have been produced by hybridizing with the foreign kinds, they have none of them proven quite as hardy or as well adapted to general use as the hardiest purely native varieties. From the foreign admixture they generally retain some degree of tenderness, with a disposition to mildew of the foliage in bad seasons or in unfavorable localities. But although they may not be suited to all places, and may always require more skill and attention than the hardier natives, that they can be grown in great perfection under favorable conditions is abundantly proven by the magnificent specimens annually upon exhibition at all our prominent fairs and horticultural meetings.

The idea of any one grape suited to general or universal culture in our extended country of diversified soil and climate, I fear must be given up; and we must look for the highest success by choosing the special varieties which are best adapted to particular localities.

With these remarks, I will give my impressions of some of the more prominent new grapes as they have appeared to me either by actual trial, or from examination upon exhibition.

The white or light-green and yellow varieties, are the most numerous, and among them

THE NIAGARA will probably be pushed most persistently by the stock company who have it in charge, and who are industriously manipulating public opinion in its favor. It is a handsome, light-green grape; bunch and berry full, medium to large, in size; skin rather thick and tenacious; pulp tender, and quality fair to good; to my taste better than Concord. It is evidently productive and a strong grower, and succeeds well at Lockport, where it originated. It may therefore be reasonably expected to do well in all similar localities. Compared with other grapes exhibited at Rochester in September, 1879, it appeared rather earlier in ripening than Concord; and specimens exhibited in fair condition at the meeting of the Ohio Horticultural Society in December last, show it to be a good keeper. I regard it as promising and worthy of trial; but with some doubt as to its hardiness in severe Winters without protection.

THE PRENTISS is another new white variety, sent out for the first time in the Autumn of 1880. There is no question as to the extraordinary productiveness and fine quality of this grape in its native locality. The clusters and berries are of full medium size; skin thick; flesh tender; quality so much like the Rebecca as scarcely to be distinguished from that variety. Upon the health and hardiness of the vine will largely depend the value of the Prentiss for general use; and though promising and worthy of trial, its character in these respects can hardly be considered as established.

THE DUCHESS is still another white grape of recent introduction. Very handsome, and very good. In quality, as exhibited by its introducers, better than either of the two above named. Several vines planted the past season made a good and tolerably healthy growth; but from the character of its foliage and general habits, I think it will be found in most places, suited only to amateur or garden culture; subject to mildew of the foliage in unfavorable seasons, and to injury in severe Winters; like the Croton, and Allen's Hybrid.

THE LADY WASHINGTON, one of Mr. Ricketts's grapes said to be a cross between Concord and Allen's White Hybrid, has been exhibited by its originator for several years, and is of the largest size, very attractive in appearance, and of excellent quality. Not of very high flavor; but pure, and free from foxiness. The berries are a light, pale yellow, with pink tinge when exposed to the sun. A few vines planted the past two seasons, have made a strong growth, with large foliage of the Labrusca character, and quite healthy. So far as tested, very promising. Will probably be found as hardy and as healthy as the hybrids of Rogers. Upon the success of the Lady Washington will probably depend the popularity of others of Mr. Ricketts's beautiful grapes; as I suppose it is introduced as one of the most promising for general usefulness. It ripens with the Concord.

THE POCKLINGTON among the white varieties of the pure Labrusca type, is worthy of attention for large size and handsome appearance, with a vine and general habit of growth closely resembling the Concord, apparently healthy and hardy. It ripens a little later than the Concord, and is in some respects better flavored though having rather more of the native aroma called foxiness. Unlike the Concord, however, it is a long keeper and I think will be found a popular and valuable market grape, worthy of extensive trial.

ANTOINETTE is the name of one of the late T. B. Miner's Concord seedlings, of the Concord type, but white in color, and of very fair flavor and quality, ripening a little before Concord; will bear handling better, and is a better keeper. Berries large; clusters medium. I think it will prove to be a healthy and hardy grape, of better quality and larger size than the Martha.

PURITY is a small, white grape, a native cross with Delaware; a stronger grower than the Delaware, with large, thick, downy foliage which has been always free from mildew; the vine as hardy as Concord in the severest Winters. It is among the very earliest in ripening, and in flavor and quality is unexcelled even by the Delaware. Its only fault, as grown at Delaware where it orginated, is its small size. The berries are a little larger than Delawares; the clusters average smaller. As it seems also to be, like the Delaware, entirely free from rot, it may be worthy of planting, nothwithstanding its small size.

NOAH is another white grape of entirely different character supposed to be a Taylor seedling of the Cordifolia class, and the best of its kind which I have seen grown in Ohio. It seems to have the remarkably vigorous growth, health and hardiness of the Elvira Grape, with larger and less compact clusters, better quality and less liability to crack when ripening. A little later than Concord. Recommended both for the table and for wine-making.

Several very handsome white varieties claimed to be Concord seedlings, of various degrees of merit were sent me from Illinois, some of which I have under trial. If they prove satisfactory as to growth and foliage, and are as good as those sent me from their native place, they will certainly rival the best yet introduced. Some Delaware seedlings, both white and red, promise to be improvements upon the parent in size, growth and health of foliage.

MOORE'S EARLY may now be regarded as pretty fairly tested, and cannot be better described than as an early Concord, with smaller clusters, and rather larger berries. I cannot see that it is superior to its parent in any important particular, except that it ripens from a week to ten days earlier.

WORDEN'S SEEDLING is one of the best black seedlings of the Concord character, very productive, with clusters averaging larger than Concords, rather better flavored, and five or six days earlier in ripening. It is, however, like the Concord, tender-skinned, and does not keep very well after removal from the vine. In hardiness, foliage and habit of growth it is almost identical with the Concord.

EARLY VICTOR is the name of a very promising, early, black grape, sent me by John Burr, of Leavenworth, Kansas. I have fruited it for two years past, and regard it as the best grape of its character that I have seen; and one that should entirely supersede the Hartford, Early Champion, Janesville, Whitehall, and all that abominable class which have, in my judgment, no merit except earliness; and which no man with a decent sense of self-respect or humane regard for his stomach should tolerate. The Early Victor is very early, healthy, hardy, and productive, with really

FRENCH THORNLESS.—FROM LIFE.—REDUCED ONE-THIRD.—FIG. 133.—See page 162.

good quality, pure in flavor and wholly free from coarseness or offensive odor. The clusters are handsome and well-formed, of the size of well-grown Clintons; period of ripening two weeks before Concord; foliage of the Labrusca type; growth strong and vigorous. Clusters hang long on the vine without impaired flavor; and berries do not fall. A fair keeper after taken from the vine. I do not know that it has been offered for sale; but when it is, I believe it may be purchased with entire confidence.

THE BRIGHTON, the past season, was very satisfactory, and must be classed among the best of the red grapes, for quality. It is a strong, vigorous grower, very productive, bearing handsome clusters of medium-large berries of rich and sprightly flavor. The foliage is large and not more subject to mildew than the hybrids of Rogers. Its only serious fault here is its tenderness in Winter. Except in mild Winters, it will require protection.

HERBERT, OR ROGERS'S HYBRID 44, cannot be called a new grape; but it deserves renewed attention, and is worthy of more notice than it has received; as it is one of the very finest black grapes, in all respects, within my knowledge. Among the strongest, hardiest, and most vigorous in growth of Rogers's well-known hybrids, it is also large in bunch and berry, and early in ripening. In flavor rich, sweet and sprightly; flesh tender and juicy; with no trace of coarseness or foxiness. I regard it as a first-class black grape, worthy of a place in every garden and vineyard.

THE LADY GRAPE has been largely planted, and scarcely needs either description or recommendation. The demand for it has steadily increased, and although there has been, in sections, complaints that its growth was not satisfactory, it has generally succeeded well, and may be regarded as a standard, and reliable early grape of fine quality, specially desirable for home use and near market. From its thin skin and tender flesh, it is not suited for distant shipment or rough handling; and it is not a long keeper. But the perfect health and hardiness of the vine, its productiveness, the handsome appearance and fine quality of the fruit and its extreme earliness in ripening render it more desirable than any other among the very early grapes yet introduced.

THE JEFFERSON, one of Mr. Ricketts's grapes, said to be a cross of Concord with Iona, seems to possess great merit, and certainly to be worthy of extensive trial. The grape very closely resembles the Iona in appearance, having long and large clusters, usually shouldered, and large berries. The flavor has much of the peculiar richness and sprightliness of the Iona, and seemed to me even richer and better than that favorite variety. If there is no mistake about its parentage, and the vine proves as hardy and healthy as it is claimed to be, it will prove a most valuable acquisition. I have not personally tested it sufficiently to say more than this, its foliage, so far, has been healthy.

FRENCH'S SEEDLING
FIG. 134.

EL DORADO, a grape of the same parentage as Lady Washington; and Highland, a Concord seedling crossed with Jura Muscat, are both fine grapes, and from a limited experience, seem promising as to foliage and habits of growth; but further trial will be necessary to determine their character accurately.

I can, in conclusion, only mention briefly a few of the many promising seedlings, principally from the Taylor and its class, which have been produced in the Southwest. They all seem to have remarkable vigor of growth, hardiness and health of foliage with great productiveness; and though specially recommended as wine-grapes, some of them will doubtless be valuable also for table use. Among those most promising are AMBER, PEARL, TRANSPARENT, UHLAND, BLACK TAYLOR, with several others known only by number. The above-named were produced by Jacob Rommell.

The MISSOURI RIESLING, and several other seedlings of the same character by Nicholas Grein, of Missouri, are there regarded as very promising; and there are many others constantly appearing, from which it is believed the most valuable results will be obtained for the vine growers of the country.

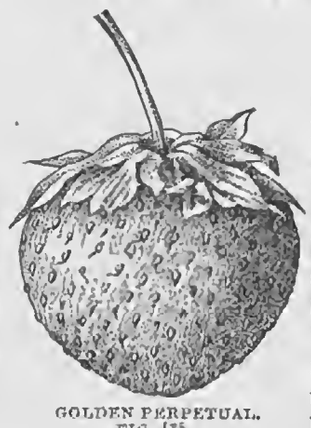
SMALL FRUITS IN NORTHERN VERMONT AND CANADA.

T. H. HOSKINS M. D.

Grapes.

I HAVE recently received a copy of the Weather Bureau's Report, with maps showing the isothermal lines for the different months. It was interesting to see that, although we have the temperature of Quebec at this point during the Winter months, we have the temperature of Southern Massachusetts during July, August and September. These are the months that make the grapes, and the early varieties accordingly ripen their fruit very well here and to the north and west so far as Montreal. But as the vines do not start so early in the Spring by about ten days, the varieties which are as late as Concord, or later, do not mature their fruit oftener than one year in three or four. In the city of Montreal the vines start as early as in Massachusetts, and the Concord ripens every year, though better some years than others. It can hardly be said that Concord, Isabella, Iona or Catawba ever reaches complete perfection anywhere north of Long Island Sound and east of the Adirondac Mountains.

The Delaware Grape is unquestionably the best and most successful variety among those well known and generally disseminated, for this and surrounding localities. Next I should place the Adirondac which, however, has a feminine fickleness that is very disappointing as regards a crop. Ennelan, Hartford, Creveling, Salem, and Allen's Hybrid are grown successfully. Champion, or Talman, ripens, perhaps, earlier than any other, but its poor quality, except for preserving, renders it undesirable. Massasoit and Lindley (Roger's 3 and 9) ripen usually, and are growing in favor with those who have tried them. Sweetwater, is quite a favorite, and an improved Sweetwater, larger in berry and far finer flavored than the old Sweetwater, has appeared in Montreal. Several early grapes of the Chasselas type are also grown successfully near Montreal; but all these foreigners suffer badly from thrip and mildew, though dusting with dry sulphur is almost a specific for the latter. From observation I think foreign grapes are generally more successful when grown here and in Canada out-of-doors than farther south. With some shelter, and especially in town gardens, they may be considered quite satisfactory. Among the new early grapes much is expected from Moore's Early, Vergennes, and r. Pringle's Golden Drop, the last an excellent white grape, closly allied to the Delaware in all its characteristics.



GOLDEN PERPETUAL.
FIG. 135.

Strawberries.

Wilson, here as everywhere, is the standard market berry, and is grown, even for a family supply, in three-quarters of the gardens. Downer's Prolific is regarded as the best ly, preceding Wilson by five or six days. Charles Downing is a general favorite. Crescent Seedling has been largely planted within a year or two, but I doubt if any pistillate variety will ever be held in much esteem. Monarch of the West is a failure generally, not ripening over the ends. Col. Cheney is too weak-stemmed, lying down in the dirt, and (unless both hands are used) the whole cluster comes off in picking instead of a single berry. Kentucky, Glendale and Windsor Chief are being tested for a late crop, but I have no decided success to report with any late variety as yet.

Raspberries.

Clark and Philadelphia have proved pretty satisfactory among the reds, but neither is enough superior to wild berries, which grow in great excellence and profusion and sell for six cents a quart, to induce extensive planting. Turner has not been tried, so far as I know. Nothing but the very hardiest will stand any chance in this climate. The Blackcaps, chiefly Doolittle, are grown for market, and sell readily in all our villages at 10 to 12 cents. Mammoth Cluster and Davison's Thornless are both failures. Seneca prolongs the season a little, and appears about equal to Doolittle. Gregg has not been tried.

KENTUCKY.—FIG. 136.

KENTUCKY.—FIG. 137.

Blackberries.

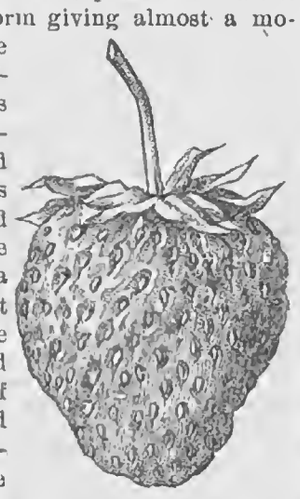
No blackberries will stand our Winters uncovered. By planting the hardier kinds under the lee of a fence, where snow drifts will soon cover them, we occasionally secure a good crop. Sable Queen has given the most satisfactory results, being quite as hardy as any, very productive, with large, handsome fruit of good quality.

Gooseberries.

Houghton's, Downing's, Smith's, the American and Shaker Seedlings have all been tried, and all succeed well. Downing mildews somewhat, especially if neglected.

Currants.

Currants are our most profitable market fruit, the currant worm giving almost a monopoly to the large grower who can afford to attend to his bushes in time. Hellebore is here applied as soon as the bushes are in bloom, and when it is well done we rarely see a worm. The fruit brings as good a price as strawberries, and can be grown at half the cost. The Red Dutch is the only variety of much value for market, La Versaillaise and Cherry being poor bearers, and white varieties unsalable. The Red Provens was at one time thought to be a great acquisition. It is extremely productive, but the fruit rots on the bushes almost as soon as ripe. We are looking for something superior in Fay's Prolific.



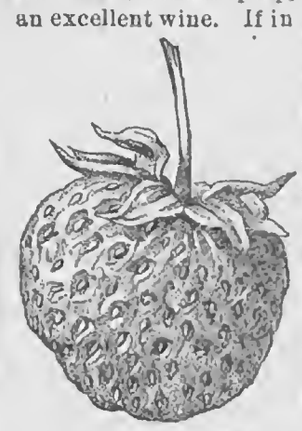
ARNOLD.—FIG. 138.

Orleans Co., Vt.

OUR NEW RIPARIA GRAPES.

PROFESSOR GEORGE HUSMANN, COLUMBIA, MO.

WHILE Eastern grape-growers, in producing new seedling grapes, have mostly sought to improve the Labrusca, and to hybridize it with the Vinifera, our Western men have turned their attention more to the improvement of the Riparia, or River Bank Grape, taking the well known Taylor or Bullitt for the parent. Their efforts were directed more to the production of valuable wine grapes than of those adapted for table and market; and, taking this variety for a starting point, the object they had in view may be summed up in a very few words. The Taylor has a thin skin, tender pulp, is juicy and makes an excellent wine. If in its seedling we can increase the size of bunch and berries, also making them set better and prove more productive while they retain the good qualities of the parent, we shall have what we want—a first-class *white wine* grape. That they have succeeded in this more than they dared to hope, no one can doubt who has seen the seedlings grown and tasted the wine made from them, which already is competing successfully with the best vintages and productions of the Rhine. But that they should also be able to produce superior table and market grapes was more than they expected. As all these seedlings seem to be entirely phylloxera-proof, and as they withstand the coldest Winters without the slightest injury, I may safely predict that they will form one of the foundations upon which the failing vineyards of France and California will be rebuilt, especially as they propagate very readily from cuttings. I will give short descriptions of the most prominent varieties. Mr. Jacob Rommell, of Morrison, Mo., has produced the following:



ARNOLD.—FIG. 139.

ELVIRA.—Too well known already to need a minute description. Bunch medium, shouldered, very compact; berry about the size of the Catawba, greenish-yellow, with pale amber tint when fully ripe, sweet, sprightly and good. Vine short-jointed, stocky, with fine, deep-green foliage, enormously productive.

AMBER.—Same parentage—Bunch fully medium, shouldered, not so compact as Elvira; berry oblong, pale amber when fully ripe, size of Isabella; skin thin but tough, covered with an exquisite bloom; very sweet, high-flavored, juicy, with very little pulp. A beautiful and very good grape, valuable for market and wine. Vine a strong, long-jointed grower showing accidental hybridization with Labrusca, healthy and productive.

PEARL.—Similar to Elvira in bunch and berry, but not so compact and finer flavored. A very strong grower, with beautiful deep-green foliage—of high promise for wine.

From Elvira seed, Mr. Rommell has produced several which are of very great promise, but not in the market yet, and which have only fruited twice. They are:—

ETTA No. 3, a strong, vigorous grower, showing a slight mixture with Labrusca; very productive. Bunch medium-compact, shouldered, from three to five on a branch; berry round, larger than Catawba, light green, turning pale amber when fully ripe, juicy, sweet and delicious, very pure in flavor and with tender pulp. If this grape increases as much in size of bunch and berry as the Elvira has done, it will be a treasure to grape-growers. It shows a great increase in size over last year already.

ELVIRA SEEDLING No. 4.—Bunch very long and loose; berry about the size of Catawba, pale amber, round, later than the foregoing, very juicy, sprightly and fine in quality, pure Cordifolia leaf; a strong grower.

ELVIRA No. 5 (named Faith, because Mr. Rommell has faith in it).—Bunch long, with heavy shoulder, rather loose; berry round, about size of Delaware, pale amber, sweet as honey and of very pure, fine flavor; seems a very strong grower and productive; vine shows some admixture between Cordifolia and Labrusca. These are the most prominent of Mr. Rommell's seedlings of Taylor and Elvira. He has many others not so fully tested, and some belonging to other classes, of great promise.

Mr. Julius Weydemeyer, of Hermann, has produced, also from Taylor seed, the

UHLAND, a beautiful and very good grape, containing a high per cent. of sugar, as the must ranges from 90 to 100 degrees, and makes a delicious wine resembling the finest hock. Bunch medium, moderately compact, shouldered; berry rather below medium but nearly as large as Catawba; round, golden-yellow, changing to pale amber. Vine a strong grower.

CAROLINE.—FIG. 140.

GREEN'S GOLDEN No. 2.—Vine a moderate grower; leaf shows admixture between Riparia and Labrusca. Bunch large, shouldered, loose. Berry round, larger than Concord, bronzy-yellow, transparent, very juicy, sweet and tender pulp; leaf heart-shaped. This is a beautiful and good grape; would be very attractive for market, if the skin does not prove too tender.

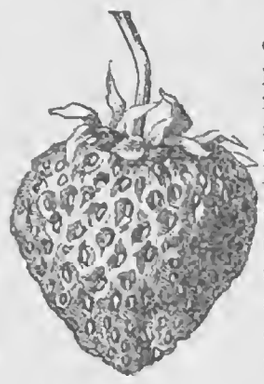
These are not yet named:—

No. 3.—Vine a moderate grower and healthy; heart-shaped foliage, showing admixture of Labrusca with Riparia. Bunch compact, not shouldered. Berry round, below medium, a trifle larger than Delaware, yellow, turning pale amber when fully ripe, very sweet, high-flavored and good.

No 4.—Bunch and berry about size and shape of Delaware; straw-color; berry round; pulp very tender, sprightly and sweet, very good. Riparia class, with slight mixture of Cordifolia; heart-shaped.

No. 5.—Bunch medium, compact, not shouldered. Berry color of Catawba, but not quite as large, pulpy, but sprightly, thick skin; very productive; Labrusca foliage.

No. 7.—This is the earliest of the lot; a charming little grape. Bunch and berry about size and shape of Delaware, golden-yellow, with peculiar star-like specks, spicy, sweet and juicy; little pulp; must make first-class wine; leaf deeply lobed, showing a mixture of Labrusca and Riparia.



HERVEY DAVIS.—FIG. 141.

Mr. Nicholas Grein, of Herrmann, Mo., has produced the following new seedlings. They are evidently all of Taylor origin, some of them with a slight Labrusca mixture, and I give their descriptions as taken in his vineyard, and also at other places where I saw them fruiting.

No. 1.—Commonly called Missouri Riesling. This is the best bearer of Mr. Grein's seedlings. Vine a moderate, very healthy grower; leaf lobed and pointed; seems to be a hybrid between Riparia and Labrusca; very productive, healthy and hardy. Bunch medium, shouldered, moderately compact. Berry medium, nearly the size of Catawba, pale amber when fully ripe, very sweet and of fine flavor; tender pulp. This is undoubtedly a fine wine grape, and may prove an attractive market fruit.

THE NOAH.—A Taylor seedling of Mr. Wasserzieher, of Nauvoo, Ill., which I had also bearing in my vineyard. It is a true Cordifolia, to judge from its leaf; seems to be very productive, healthy and hardy, and I consider it very promising. Bunch long, moderately compact and shouldered. Berry round,

(Continued on page 161.)

THE
Rural New-Yorker,

PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, MARCH 5, 1881.

Now that the heaviest part of the work of the subscription season is over, we would thank our readers if they would advise us of ANY irregularity in the receipt of the RURAL NEW-YORKER.

IT is gratifying to be able to state that the interest in small fruits has not subsided any since our last special of September 7th, 1878, and it is pleasant for the RURAL to know that the suggestions, censures and praises therein published have proven exceedingly trustworthy. The interest in grapes is now probably more widespread and intense than at any other time in our country's pomological history; the interest in strawberries and raspberries may be said to "hold its own" at least; while that in blackberries and currants, and even in gooseberries, is being strengthened. We hear less, indeed, of mere *size* in strawberries, but quality, vigor, firmness and adaptation to different soils and climates are, more than then, exciting the attention they deserve. We have given our best attention to this number, and the articles which appear from our highest horticultural authorities, with our original engravings, will, we confidently hope, not disappoint the anticipations of our good friends and readers. The RURAL itself has its heart in fruit culture of all kinds, and it believes that it cannot engage in a better work than to seek to spread its enthusiasm until it shall become a delightful contagion among its subscribers from which, we trust, not one may escape.

THE Charles Downing, one of the best of strawberries, like the Wilson adapts itself to a great variety of soils. As to ripening, it may be considered medium.

WHAT has been said respecting the advisability of European vineyardists trying our new grapes might just as forcibly be said as to our new strawberries and raspberries.

THE Glendale, so far as we may judge by our own plants and by the reports which have been received, promises to become one of the most popular of late strawberries. It is quite productive, firm, of very good quality and stands drought well.

IN answer to many inquiries let us state that stamps for the "Seed and Plant Distribution" are NOT REQUIRED from those who subscribe through us for any of the papers announced in our clubbing list, the Inter-Ocean, Detroit Free Press, N. Y. World, St. Louis Globe-Democrat.

CUT all grape-vines received from the nursery this Spring so that but *one* cane remains and upon this permit but *one* bud to grow. Pinch out every axillary bud (or lateral) as it unfolds. By this plan a single strong cane will be produced, that will probably fruit the second season.

IN the way of currants there is little to speak of that is new except Fay's Prolific, a fine portrait of which was given in the RURAL of September 18, 1880. This in productiveness and size of bunch is a very decided advance in the history of the currant. It will probably be offered for sale next Fall.

IT is probably true that, unless we except the grape, no other fruit is to the same extent affected by soil, situation and climate as the strawberry. No matter how generally or enthusiastically a certain variety may be praised, it is safer to test it in a small way before engaging in its extensive cultivation.

WE have given little space to directions as to the preparation of the soil for small fruits and their cultivation. The RURAL NEW-YORKER has within a year given these directions in careful detail. Besides, in many of the catalognes which we are noticing all needed information is concisely and plainly presented.

WE find there is not one of all our raspberries—and we have one or more of almost every kind—that has not been more or less injured by the past severe Winter, during which the thermometer has been as low as 16 degrees below zero. The fact is, as we have before stated, there is no such thing as a *hardy* raspberry.

THE Crescent Seedling, of which so many and conflicting opinions have been expressed, seems to have proven itself one of the most prolific strawberries in cultivation. It begins to ripen early and continues, unless the season is very dry, through an unusually long period. It is not a firm berry, is inferior in quality and of but medium size at its best.

SEVERAL of our contributors have expressed themselves at odd times that we were hard on the Great American and others of Durand's Seedlings. Extended trial, however, seems to have shown that our estimate of them, as made from our tests at the "Rural Grounds," was not too severe. A strawberry that does well only here and there and needs special and dainty cultivation ought never to be recommended to the public in general.

IT is well known that small fruits, grapes etc., as well as large fruits may do well here and there under peculiar conditions, while in a great majority of cases over the country, they prove, if not worthless, far inferior to other varieties. We have been somewhat surprised, however, that the reports of small fruits which have been made from time to time as the results of tests at the Rural Experimental Grounds have been, and are being, so fully corroborated by practical horticulturists everywhere.

THE CUMBERLAND TRIUMPH.—Several years ago, when this strawberry was just sent out to be tested, the RURAL NEW-YORKER praised it as among the best of the many kinds we were then testing. It is of uniformly large size and our vines have been loaded with berries when many other varieties for various reasons have failed. It is of perfect shape, the flavor is excellent. The color is a pale-red or pink. That it is rather soft for shipment is all that can be said against it. We have read reports from many different parts of the country which show that this berry is everywhere growing in favor among those who have given it it a good trial.

WE might fill this page with instructions as to the preparation of the ground for grape-vines, and the reader would find himself little wiser at the end than at the beginning. There is nothing intricate about it, and long-drawn-out directions, even though plainly written, serve only to confuse the inexperienced and make him feel that he must proceed cautiously as if walking upon eggs, where only the exercise of a little good sense is required. If the land is naturally rich and well drained, it is only necessary to spade it up and rake it level. If the land is poor, good earth must be supplied to a depth of a foot at least. Bone and wood ashes may safely be supplied—or old manure of any kind. Spread out the roots carefully and cover them firmly with mellow earth to a depth of six inches. If the land is leachy and dry, a covering of old stable manure over the roots will do good service. Give *every* vine a stake or arbor to grow upon, and tie the canes to such support as they grow. Grape-vines should be planted not less than eight feet apart both ways. Ten feet apart for the vines, the rows eight feet apart, would be better.

AMONG raspberries, the Cuthbert fully maintains the character we gave it when distributing it over the country to our subscribers, as the best raspberry known. Our cut is true to life. The Turner is probably the best early raspberry. It is very hardy, prolific, and the fruit is of excellent quality. We have found the Highland Hardy uniformly the earliest, though less hardy than the Turner and of poor quality. The Gregg is making many friends and caution in commending it to our readers is no longer needed. The berries are larger than those of the Mammoth Cluster, ripening a little later. They are as black and glossy as jet. The Caroline has been discussed at length in these columns recently. We need only add that, being quite hardy, many will be glad to procure it with whom the Brinckle's Orange generally fails. The Caroline is too soft for a market berry, but the quality is such that it should be grown in every home collection. Among blackberries we may mention the Taylor as having proved extremely hardy, of excellent quality, and highly productive. But the berries with us have been rather small. The Snyder is much praised in the North and West, but it has not proved very productive at the Rural Grounds.

"BLIND" STRAWBERRIES.

MANY of our varieties of strawberries have imperfect stamens or simply the rudiments of them—such, for instance as the Crescent Seedling, Windsor Chief, Golden Defiance, Hovey's Seedling, etc. Such kinds must, of course, to bear fruit, be placed near other kinds which bear *perfect* blossoms or those having stamens at least, so that insects or the wind may carry the pollen from the one to the other. In looking over Philip Miller's "Gardeners' Dictionary" published in London in 1759, we see that he guards his readers against "blind" plants which he explains "is when there are Plenty of Flowers but no Fruit produced; if thefe Flowers are well examined, they will be found to want the female Organs of Generation, moft of them abounding with Stamina, but there are few, if any Styles, fo that it frequently happens among these barren Plants, that some of them will have a Part of an imperfect Fruit formed, which will fometimes ripen. This Barrenness is not peculiar to Strawberries," etc. But he makes no allusion to what we call pistillates or those having perfect pistils without stamens, while in our present cultivated varieties purely staminate flowers would seem to be rare, while pistillate varieties are becoming more and more numerous.

SEEDLING CULTIVATION OF SMALL FRUITS.

A LETTER from a correspondent reminds us that nothing has been said respecting the seedling cultivation of small fruits in this number. We may therefore briefly refer to the subject here. The seeds may be sown in a cold-frame or hot-bed, or in pots covered with glass. The soil should be fine and light. Shelter from the midday sun must be provided by boards, or evergreen boughs, or lattice work. The soil must not be permitted to become dry—neither must it be kept too wet. The seeds will generally germinate freely, though many may remain dormant until a second year. To cross varieties two methods may be followed. The first is to plant pistillate kinds among perfect-flowering kinds, and to separate both from all other varieties between which a union is not desired. If then the pistillates bear fruit, the pollen must have been furnished by the perfect flowers. Another method is to plant the females, or pistillates, under glass, and to apply the pollen from other selected perfect flowers as desired. These latter may also be cultivated under glass or in the garden. But if it is desired to *know* the parentage, of course, they must be protected from the pollen which may be carried by insects or the wind from other plants.

Seeds of small fruits germinate far more freely planted as soon as they are removed from the berry. If not planted until the ensuing Spring, they should be wrapped in bits of paper or muslin and preserved in sand, which must be kept slightly moist in a low temperature, or they may be placed in boxes of sand and buried during the Winter.

The seeds of grapes, raspberries, blackberries, currants and gooseberries may be sown in cold-frames in the Fall, and if the frames are properly protected during the Winter, they will, for the most part, germinate in early Spring. The frames in this case should be filled with moss, straw or hay. It simply amounts to burying the seeds, except that they are already properly planted. As we have before stated, grape seeds will, many of them, germinate in three weeks if planted in pots as soon as they are taken from the berries. The pots should be kept in a greenhouse or sunny window in a pretty uniform temperature of 70 degrees. Anybody may raise his own small fruit seedlings and feast upon the varieties which he himself originated.

BREVITIES.

CURRANT items are current for this number.

THE cions of grafted grape-vines will usually bear the second season.

OUR friend Mr. Derrick, defines strawberry SHORT-cake as "a cake without any strawberries in it."

LATE February or March in the South and April in the North, are the best times to graft the grape-vine.

WE are glad to find that the Caroline Raspberry has stood the Winter at the Rural Grounds as well as any.

CUTTINGS of varieties of the grape, which do not root readily, or weak-growing kinds, may easily be grafted on other stocks.

OUR cuts are all from nature and we have carefully avoided any exaggeration. Perhaps we have inclined the other way.

WE repeat what the lamented M. B. Bateham once told us, that bone dust and wood ashes are the best fertilizers for the grape.

WE have between 60 and 70 varieties of new strawberries upon which we hope to be able to make a full report in time for late Summer planting.

MONDAY, Feb. 28.—Upon a careful examination of our raspberries, we find that the Turner is least harmed of any variety in our test grounds.

WE respectfully object to Dr. Hoskins's expression "feminine fickleness," as applied to the Adirondac Grape, or, in fact, to any fruit or to anything whatever!

STRAWBERRIES raised under glass are now selling at the retail stores of this city at 75 cents per dozen. They are of small to medium size and only half colored.

MR. LOVETT writes us that "Herbert," Rogers's No. 44, is a splendid grape. So we have thought, not from experience, as we have not tested it, but from what other friends who have, have said of it.

As goose turns to geese in the plural,
The same rule to berries applied,
Gooseberry would be in the RURAL
Gooseberries, in flocks if espied.

WE had supposed from our own tests that Prouty's Seedling would become better known. It is very handsome and of excellent quality while the plant, with us, is strong and productive.

WE may be permitted to hope that our subscribers, after having read this number of the RURAL NEW-YORKER, will feel, for once in their lives, that they have had enough of small fruits.

IT seems to us that this number of the RURAL NEW-YORKER together with the catalogues of Small Fruit nurserymen, ought to answer most of the pressing questions which may arise in the minds of those who cultivate small fruits.

WE have tested "Goethe" (Roger's No. 1) and Rickett's Secretary during the past six years, as we remember. We shall this Spring dig up the vines to make room for new-comers, that may or may not prove to be more worthy of cultivation.

POTTED strawberry plants have been well tried and found wanting. They are worth no more than first-rate plants not potted and decidedly less if not well potted and transplanted at the right time. We hope small fruit growers will give up pot-plants.

MR. CHARLES DOWNING tells the agricultural department of the New York Tribune that the Snyder is the best blackberry for a cold climate; very hardy, immensely productive, about two thirds as large as Kittatinny, but will produce as many bushels per acre; the quality is equally as good as Kittatinny, or any other.

IF MR. E. P. ROE were asked what is the most beautiful and delicious strawberry in existence, he would name the President Wilder. He thinks it is perfect in flavor, form and beauty, and that it unites in one exquisite compound the best qualities of the two great strawberry species of the world, the Fragaria Virginiana and the F. Chilensis. The fault that he discovers in it is, that in many localities it is not productive.

MR. P. J. Berckmans, the well-known horticulturist and nurseryman of Augusta, Ga., says that the Wilson is the most profitable berry on his grounds; Monarch of the West next. Col. Cheney, Cumberland Triumph, Black Defiance and Kentucky do well. The Neunan is the great berry for the coast about Savannah. It is sent to this market in March and April in immense quantities. The berry is aromatic and pretty but very sour.

A CONSIDERABLE time ago, a box of the Duchess grapes was sent to us, by Mr. A. J. Caywood of Ulster County, N. Y. These grapes had been sent to several other places and, if we have not forgotten, exhibited at one or two fairs. The note from Mr. Caywood stated that Mr. Downing, after eating some of them, remarked that they had "raisened somewhat and were as sweet as a raisin," or words to that effect. Now, the grapes sent us *were* more raisin than grape and they were as sweet as a raisin to our taste; wherefore we repeated and emphasized what we supposed Mr. Downing had said, as our own opinion. But we have reason to believe that Mr. Downing did not make use of the words which Mr. Caywood imputes to him, at all. This is not the first time that opinions regarding the quality and value of new fruits have been printed as Mr. Downing's, which he never expressed or entertained, and it is time that such liberties with the respected name of our first pomological authority should cease. We are not authorized by Mr. Downing to make the above remarks. But we take for granted that one who habitually expresses his judgment so conservatively cannot be pleased to see his name signed to statements which, whether trustworthy or not, he never uttered or perhaps entertained. We respectfully call upon Mr. Caywood to state how it happened that Mr. Downing was erroneously quoted in his letter above alluded to.

(Continued from page 151.)

about size of Catawba, or a trifle smaller, greenish-white, not quite as juicy as Elvira and other Riparia I know; with harder pulp and a tongher skin, but sweet and of pleasant flavor. It will no doubt carry well to market, and I would rather eat it than Prentiss, as it is more spicy. Makes a very fine wine.

THE NIAGARA GRAPE.

(See page 149.)

In the Fall of 1879 Mr. J. S. Woodward sent us a Niagara grape-vine with the request that we would test it under the condition that the wood of the season's growth should be returned to him. It was planted in black half-muck, sandy soil to which a small quantity of barnyard manure was added. The growth was confined to a single cane which at the end of the season (last Fall) measured in length 18 feet. The remarkable engraving presented is an exact copy of a photograph of a vine taken Sep. 6th 1878 in a vineyard of about one acre planted in the Spring of 1878. The ground had formerly been in vineyard of Ionas and Israellas which had been removed three years previously. After their removal, it was planted to strawberries which bore one crop and the vines were then removed and the ground planted to mangels.

The Niagaras were one-year-old plants and after they had grown about one foot high, the young growth was entirely killed by frost.

One bearing arm of the vine shown was 18 inches; the other 30 inches in length, making four feet of bearing wood. It bore 63 clusters which weighed when picked, Nov. 6 (though ripe in late August), 26½ pounds. The whole vineyard, according to Mr. P. C. Reynold's estimate, averaged over 10 pounds of fruit per vine.

The Rural New-Yorker with no interests to subserve save those of the public, has endeavored in every way to present such information as might serve to guide its readers in their selection of the new fruits which, in less or greater numbers, are every season brought to notice. Among the many kinds of new grapes of high promise, the Niagara unquestionably, so far as can be judged from trials necessarily restricted, takes a foremost place. Still, beyond the fact of its vigorous growth in our Experiment Grounds, we are only enabled to state what others have said regarding it. We should feel sadly disappointed if a grape that has revealed so many qualities which seem to adapt it to the wants of the thousands, should after a while be found wanting in some essential quality.

CURRANTS-LEE'S PROLIFIC.

(See page 146.)

The currant plant requires a cool climate. It rarely, if ever, is injured by cold, but it is impatient of heat and drought. So decided is it in this respect, that while it has proved eminently lucrative in some sections of the New England States, New York and elsewhere in the same latitude, yet only in exceptional cases has it been found profitable south of the isothermal line of Philadelphia. It suffers chiefly from the bright sunshine of July and August, causing it to drop its leaves prematurely and thus rendering it unproductive. This feature, of course, varies somewhat with the different varieties, but to no great extent. The spread of the currant worm having now become so universal that the pest is to be found almost everywhere, has no doubt been the means of preventing many from planting and caused others to neglect their bushes. This should not be, for this insect is as easily controlled as the Colorado Potato Beetle, and anyone who is not willing to employ the necessary means to rid himself of the pest, can scarcely be said to deserve the fruit. Nobody thinks of going without potatoes on account of the beetle! Just here I may note the currant worm has never troubled any of my black currants.

It seems peculiar that in this age of progress so valuable and important a fruit as the currant should have suffered such general neglect. Had it received a tithe of the care and time in its improvement that have been devoted to the strawberry or the grape, there is little grounds for doubt but we would now have at least a hundred fine varieties instead of less than a dozen that are worth cultivating. Fay's Prolific—figured in the Rural of September 18—seems to be a move in the right direction among red varieties; and Lee's Prolific, which originated in England a few years past with Mr. Lee, marks a great advance among the black. As is well known, black currants are used principally for making jams and jellies. In the New York market, at least, they usually meet a ready sale at remunerative prices; but growers need a variety with larger bunches than those of the varieties hitherto cultivated, that the crop may be gathered more quickly and at less expense; while amateurs desire a kind with less austere and less musky fruit. Lee's Prolific supplies the requirements of both. As will be seen by Fig. 111, which is a representative cluster, it is a vast improvement in size, both of bunch and berry, on the old varieties. At the same time the quality is much milder and better. The bushes are of stocky, rigid growth and the term "prolific" in the name, is applied with singular appropriateness; for the amount of fruit they bear is simply astonishing. It ripens about ten days in advance of the well-known Black Naples, which, although no special advantage, is, so far as I know, no disadvantage. Unlike the old varieties of the black currant, it is quite difficult to propagate, one reason, no doubt, why it has not become better known and a feature which will impede its progress to popularity in the future.

Little Silver, N. J. J. T. L.

The Scuppernong Grape.

We do not remember ever before to have seen a large, life engraving of the well-known Scuppernong or Southern Muscadine. The branch portrayed was sent to us from Aiken, S. C., by Mr. S. Ott, when the grapes were still green, though nearly of mature size. The leaves are shiny on both sides, small, coarsely toothed. It will be seen that the bunches consist of several grapes only, instead of many as in other varieties. The berries are large—over a half-inch in diameter—having a thick, tough skin and a musky flavor, ripening in early Autumn. The Scuppernong is a variety of Vitis vulpina, the Southern Fox Grape—the same as the Concord is a variety of our Northern Fox Grape—Vitis Labrusca. A distinctive characteristic of the Southern Fox Grape is that the bark is firm, never separating in strips as in other species.

THE SCUPPERNONG GRAPE.

H. W. RAVENEL.

This is an American grape, and an accidental seedling or "chance sport" of our native Vitis vulpina, or Bullace grape. All the traditions of its origin point to the eastern shore of North Carolina, on a small lake or river of that name. From that original source it has been propagated by cuttings and layers.

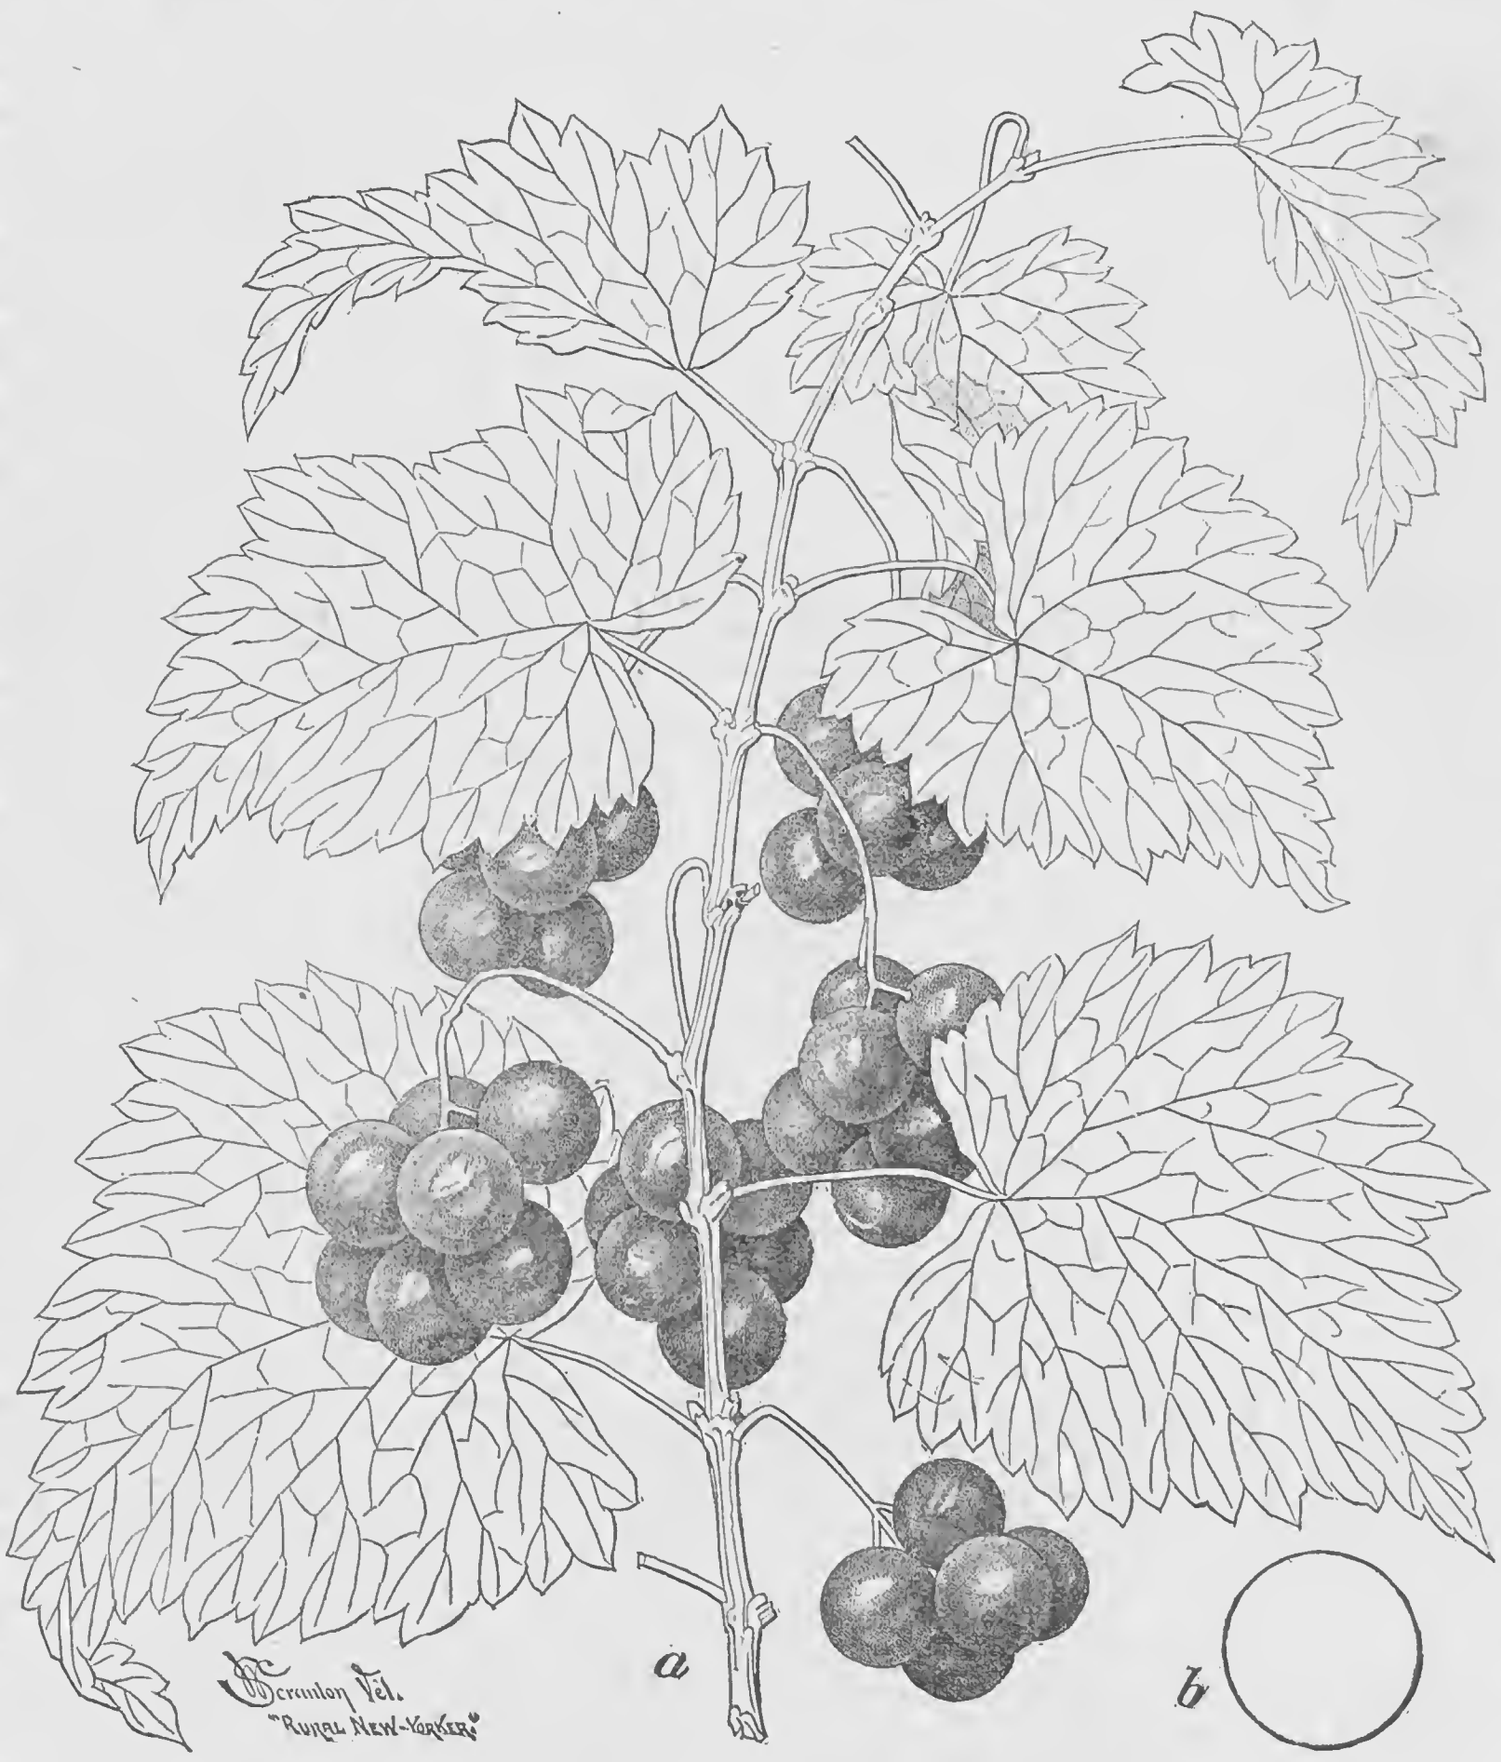
It is essentially a Southern grape, ripening here in this latitude during the month of September, and it could scarcely be cultivated successfully beyond the lower portion of Virginia. It is later in shooting in Spring than any other grape, not blooming here before the middle of May, thus escaping all risk of Spring frost. The thick skin protects the fruit from atmospheric changes and it never rots. It is hardy, vigorous in growth, well adapted to any kind of soil, and, with proper management, it gives a safe and certain crop.

Like its parent, the wild Bullace, the berries are few (from one to ten or twelve), borne in loose clusters, and mostly ripening together. The berry is round, and, when fully grown, about the size of a boy's marble. Like all the so-called "white grapes," the fruit is green (like the Malaga in color), changing to a dull brown when fully ripe. With a large tough pulp when half ripe, it loses most of the pulpiness when thoroughly ripe. The flavor is peculiar, and unlike that of all the foreign or American grapes in cultivation.

The whole habit of the grape is so unlike that of those in general cultivation and its training and management are so entirely different, that I may be pardoned for going somewhat into detail in what may be new to most of your Northern readers. From the compact structure of the wood it is difficult to get cuttings to strike. The usual mode of propagation is by layering. Those who propagate largely keep certain vines for that purpose, well cut back to the stump, leaving numerous shoots of short length with four or five buds. In the Spring these start and grow rapidly. By June they have attained a length of five or six feet, and are then fit for layering. A bunch of them, say from six to a dozen, are brought together, the leaves stripped from the lower portion, a hole made with the trowel near the stump, and a handful of well rotted manure thrown in; the vines are bent down into the hole, and earth is banked upon them to keep them in position, the exposed ends being slightly elevated by pressing the earth upwards. Hoe off weeds and grass during the Summer, and by November they are ready to be lifted—all well rooted. One good, strong root may give from fifty to a hundred layers.

These rooted layers may be planted out at any time during the Winter. The usual mode of training is on a canopy, which is enlarged as the vine grows. They should be set about 25 to 30 feet apart in all directions, and even a greater distance on very rich land. With these, as with all other plants, care in making a good start, by opening large holes and manuring well, tells on the after growth.

After they are planted out, the young vines should be cut back to three or four buds, and a stake driven in near the vine, standing about six feet out of ground, to which the vine is tied. As the season advances all the lateral shoots must be pinched off, so as to leave a single clean stem, which is kept tied to the stake as it grows. At the end of the first season it should have reached the top of the stake.



a, THE SCUPPERNONG GRAPE.—FROM LIFE.—REDUCED ONE-THIRD.—b, NATURAL SIZE OF THE BERRY.—FIG. 142.

The following Winter a canopy must be started on which the vine may be spread. Four upright posts, about six feet high and ten feet apart, with slats over the top, will give space enough for the second season's growth. This canopy can be extended afterward to suit the vine. It is important that the vine be kept uniformly spread out over this canopy so as to give sun and air. If they overlap and become crowded, the production of good fruit is lessened. The trunk must be kept clear of all laterals below the main branches on the canopy.

The Scuppernong is said not to need pruning. This is measurably true. The habit of this species is the starting of most of the buds which in other grapes remain dormant. There is then a greater subdivision of the branches, and a more bushy and compact growth, without these long branchless shoots so common to other grapes. The bushy, compact habit and the evenly distributed fruit render pruning unnecessary. A judicious thinning out of branches when they are too crowded, and the cutting away of feeble parts will help the general vigor of the plant.

The vine will begin to bear the season after it has taken to the canopy, the second year from the layer. As the growth increases annually, so does the production. I cannot give, from my own knowledge, any definite statement of the production, never having made any careful measurement; but 25 to 30 bushels to the old vines are often spoken of. A vintner in North Carolina says, in one of our horticultural magazines: "We have a good many single vines that bear 50 to 75 bushels." A bushel of Scuppernong grapes, weighing about 60 pounds, will yield from three to four gallons of wine, besides the vinegar that may be made from the pomace. In making the wine, it is usual to add about one pound of crushed sugar to the gallon of juice, to give it more body and better keeping qualities.

Besides the Scuppernong there are several other good varieties of Vitis vulpina in cultivation. Among them may be mentioned, Thomas, Flowers, Mish, Tender-pulp, Peedee. The last-mentioned and the Scuppernong are greenish grapes, the others black or purple. They are all, I believe, accidental seedlings; that is, they were found in the woods, and have not resulted from man's improving agency.

It is a curious fact in regard to this species, that whilst there is a great tendency to variation in the quality of the fruit, even in the wild state, the other botanical characters remain permanent. I have compared carefully these cultivated varieties with the wild grape,

and can detect no change whatever in leaf or general habit. The only deviation, besides that of color in the *fruit*, is in the color of the *tendrils*, three of the so-called white varieties —Scuppernong and Peedee—having pale greenish tendrils, while the purple kinds have purple tendrils.

There is undonbtedly a good field here open for experimenting and improving the vigorous and prolific Southern grape. In every case that has come under my observation, the seedlings of Scuppernong have reverted to the original black grape. Of some 50 or 60 seedlings that I have raised from selected fruit, all were black and inferior to the parent. I have no doubt, however, that with systematic and persevering endeavors, better varieties may be obtained. Taking advantage of the tendency to variation in this as in other grape seedlings, some variety may yet be found of *better quality* and *earlier habits*, so as to be capable of cultivation further North.

Aiken County, S. C.

THE GOOSEBERRY.

The editor of this paper has before now given his opinion that it is sometimes as useful to tell our failures as our successes, and with us the gooseberry is only a partial success. In the early days of our horticultural experience, when we were more sanguine than now, our garden was planted with Crown Bob, Whitesmith and Roaring Lion. For some years they grew well and bore a fair crop of enormous berries; but one unfavorable season brought mildew and, strange to say, the fruit was never afterward clear of the pest, which seemed to settle down into an incurable disease. So, to my regret, the strong-growing bushes were uprooted, and in their places the Houghton Seedling was planted. This, though small, has several good qualities. It is very prolific, clear of mildew, almost free of treacherous thorns, and the fruit can be quickly and easily stripped from the bushes. But it brings only half price in the market, and during a hot, dry season at the time of ripening, the whole crop scalded on the bushes, although there was plenty of leaves, as we are not overwhelmed by the ravages of the caterpillar. For this there is no remedy unless mulching would be of avail, which would be quite an expensive operation, our system being one of clean culture. My attention has been attracted by a variety called Smith's Improved, and last season, in the catalogue of a reliable dealer, I saw it noticed as "quite free from mildew." The temptation to purchase was strong, and but for heavy expressage I should have done so, but concluded to wait till Spring. The new catalogue of the same dealer says "*almost* free from mildew," and I wait further developments. But we want a large, hardy, prolific gooseberry, as good in its place as a Concord among grapes. It is well known that in the vicinity of large cities this fruit is not liable to mildew—is it owing to the dryness of the air, or some peculiar property of the smoke and gas? If any one has had experience on this point, I shall be glad to learn. Meanwhile, what shall we plant for *profit?*

ANNIE L. JACK.

GRAPES IN CALIFORNIA.

CHARLES H. SHINN.

Many persons believe that the leading and most profitable industry in California will ultimately be viniculture in all its branches. They point to the extent of territory adapted to this purpose, and to the opportunities made for us by the comparative failure of the French vineyards. For two years past the one remarkable feature of horticultural talk on this coast has been the grape question; and it is good to see the real courage and positive enthusiasm of the grape growers as a class. They have outlived their fears and conquered their earlier difficulties. Time, labor and patience, so we believe, are now the only elements needed to make California, for good or for evil, a great grape-growing State.

Most of the progress made has been within the past five years. In 1876 about 4,000 acres of vines were planted out in addition to the area already in vineyard; in 1877, 5,000 acres; in 1878, 7,000 acres; in 1879, 9,000 acres; and in 1880, 10,000 acres. This added acreage is supposed to represent about 35,000,000 vines. Nearly 65,000 acres are now planted to vines in this State. It is difficult to estimate how much will be planted this year; but the season is very favorable, and the growers report an astonishing sale of cuttings. Thousands of small farmers are preparing to set out five or ten acres apiece. Many persons of means design to plant large vineyards. The work has already begun. February is considered the best time to plant. To guard against the phylloxera some use cuttings of American vines; others are testing our wild grape (Vitis Californica) as a resistant stock; others depend on winter-flooding the soil, or choose isolated spots and propose to fertilize well, and use bi sulphide of carbon on the first appearance of evil. If, on this pleasant morning in later January, sunlit and beautiful, one might overlook the whole State from Modoc to San Diego, wheat-sowing and the planting of vineyards and orchards would appear the most salient features of the spring-time land, fresh with countless flowers and glad with hopes unnumbered.

I have spoken of 65,000 acres now planted in vines. Arpad Haraszthy, President of the State Vinicultural Association, and one of the leading grape-growers and wine-makers, thinks that the vines at present planted ought to produce 20,000,000 gallons of wine within four years from now, or, allowing for the raisins, brandy, and table grapes used, they can safely be counted on for 15,000,000 gallons. The wine product of last year was 11,000,000 gallons, worth $3,500,000. The 400,000 gallons of brandy made are worth $600,000. The raisin crop counts for $100,000, and the table grapes for as much more. Definite encouragement as this gives, it seems small enough when compared with what is hoped for in the near future. Investigators generally agree that about 40,000,000 acres of land within the limits of this State are adapted to grape culture. Much of this is government land, or railroad land, for sale at a low price. Some of it was wheat land, but the continuous robbing of the soil for thirty years has exhausted it for the cereals. California, though only six-sevenths as large as France, has six or eight times as much land suited to grape-growing purposes. We should have to plant vineyards at the rate of 10,000 acres a year for more than 50 years, before the loss occasioned in France by the phylloxera would be supplied. The wine product of California now is only one-380th part of that of the world. Switzerland produces as much as this State, and some of our counties are larger than Switzerland and have twenty times as much grape land. Some men who plant vineyards will choose unsuitable soil or poor kinds of grapes, or will neglect to give them proper care. The result will be failure. The culture of other fruit and vegetables, will occupy the attention of many horticulturists. So, on the whole, the grape growers do not think that the business can be overdone for many years to come.

The phylloxera is undoubtedly a danger here, though it travels slowly and is only known in a limited belt north of the Bay of San Francisco, and in a few isolated vineyards elsewhere. The pest can be kept within its present limits and gradually destroyed. So far the vine-growers have agreed to levy a sufficient tax for inaugurating this good work. A graduate of the State University has established a factory to make bisulphide of carbon.

The largest vineyards in California are in the counties of Sonoma, Napa, Santa Clara, Yolo, Los Angeles, and San Barnadino, though almost every county has bearing vines of, at least, the old Mission variety. Some of the largest vineyards cover 500 or more acres, and are managed with great skill and energy. The grape belt of the State lies along the Coast Range, from San Diego to Mendocino, occupying numbers of small valleys and extending over uplands and slopes, but seldom lying less than ten miles from the sea. It crosses the great central valley of California skirting the boundary hills, sometimes extending entirely across the lowlands, and in a measure it occupies the region from Kern to Shasta. It also winds in an irregular ribbon along the Sierra foot-hills, extending up the gradual slopes till the climate becomes too cold for European grapes. Above this limit there are extensive tracts where Clintons, Catawbas and other American varieties flourish. In this extensive territory each vintner can be suited. Here are places in which to plant the favorite vines of Portugal, Spain, Italy, Greece, Madeira, and more northern favorites. It is fair to suppose that time will discover here and there locations of unique merit, vineyards of almost inexpressible value. Dr. James Blake, an acute observer, thinks that parts of Lake County may possibly produce wine of unusual quality. Little has yet been done. Those who choose the volcanic soils on the hills must not expect to raise crops nearly so heavy as are raised in the valleys.

Many calculations have been made as regards the cost of starting a vineyard in California. On land costing $50 per acre, near to market and in a good neighborhood, a vineyard can be planted and cared for through the fifth year for $125 per acre, including first cost of the land. After that, cultivating, gathering and hauling ought to be done for $20 per acre per year. Four tons of grapes per acre—which is a low average—at $25 per ton, give a profit of $80 per acre, from which, however, the interest on the cost, $125, must be taken. In authenticated cases yields of eight, ten, and even fifteen tons per acre are reported. Since the prices paid for grapes were last year often as high as $30 per ton, it will be seen that large profits have been secured. Men have paid for vineyards from the profits of two years' crops, and wine-makers have in several cases rented vineyards for a term of ten years at a cash rent of $50 per acre per year. Some of the cases reported by local journals border on the fabulous; but the true and unbiased thing to say is, that in the last three or four years the vine-growers have undoubtedly been the most prosperous class on the coast, and are doing all they can to prepare for still greater victories.

The various societies, local and State, devoted to horticultural matters are taking up the subjects of diseases of trees and vines, culture, and varieties, and each day brings out some new experiment of interest. Nomenclature is rather mixed, owing to confusion among different importations and the loss of labels, and the State Vinicultural Society is wrestling with this problem. As regards diseases, Professor Hilgard, of the State University, is doing good work through correspondence and personal observation. Among rather recent importations of varieties of grapes was the noted Almeria, a fine shipping grape for table use, and grown chiefly in Portugal. Some experiments, not yet far advanced, are being made with seedlings and hybrids of the best foreign grapes.

San Francisco Co., Cal.

GRAFTING GRAPE-VINES.

In various ways the attention of the public has been specially drawn of late years to the relations of stocks and cions of grape-vines, but nothing has stimulated investigation so much as the loss of millions of money all over Western Europe from injuries inflicted by the phylloxera. Experiments with all kinds of grape-vines have been tried, and all sorts of remedies employed, but, in spite of the largest rewards, the evil has not as yet been overcome. The attention given to the foreign problem by all nations of Western Europe and America has naturally given a new impetus to the interest taken in grafting vines in the United States. People are beginning to think of the advantage it would be to the Delaware and other grape-vines of moderate vigor in most sections, if they could be sustained and strengthened by a strong-growing stock like the Concord and Clinton. Others go even farther and ask themselves why health and endurance as well as vigor of growth might not be communicated by the stock to the cion—why a variety liable to mildew might not be kept pure and unblighted by grafting it on a rugged kind. These are, of course, as yet mooted questions, not exactly in regard to the fact that stocks and cions affect each other, but in regard to the character and results of special unions of stocks and cions. Why people have not grafted grape-vines more, both in Europe and America, must be explained by the fact that we are apparently forced, or think ourselves forced, to employ cheap methods; but the time is fast approaching when the value of grafting grape-vines with skill and intimate knowledge of the idiosyncrasies of special kinds, is bound to force itself into notice.

This subject of grafting grape-vines can hardly receive too much attention, for there is reason to hope that some of the most difficult problems of grape growing will eventually be solved, at least in part, by a happy selection and union of stock and cion.

S. Parsons, Jr.

TWO PECULIAR BLACKBERRIES.

Crystal White.—This is so very different from all other blackberries, it may be regarded as a veritable prodigy. What it is or where it originated is as yet an unanswerable question. The best information I have been able to obtain is to the effect that it was found growing wild in Eastern Illinois, and it appears to be an example of albinism in the blackberry (just as the Yellow Cap Raspberries are albinos of the Black Cap species); but of what species I am unable to determine. The canes are of strong, upright growth; are in no way an exception to those of the popular cultivated varieties in thorniness; are of a pale yellowish-green color and are abundantly furnished with light-gray foliage—quite distinct in color and shape from any of the cultivated black varieties. Berries, of medium size, rather long, as shown by Figure 111, nearly always perfect, and regular in form, clear, translucent white; exceedingly sweet, quite spicy but somewhat insipid. I would not class the fruit as "best" or even "very good" in quality, it resembling, in this respect, the common white mulberry. Like those of some varieties of strawberries, the blossoms are deficient in, if not destitute of, stamens, and it needs to be planted contiguous to a stamen-bearing variety to fertilize it, when it is excessively productive, setting fruit in such masses as often to cause the stout canes to break or bend to the earth with the weight. Having passed unharmed the Winter of 1879-80, which was notable for its many sudden changes in temperature, I had thought it hardy; but the past Winter I find has been too severe for it, for its laterals have killed back considerably. While it is strikingly beautiful in fruit and intensely interesting, it will, I am disposed to think, ever be valued more as a curiosity than anything else.

French Thornless.—There are a score or more of so-called "Thornless" varieties of the blackberry, such as Hoosic Thornless, Dodge's Thornless, Wachusett Thornless, etc., none of which *are* thornless, correctly speaking, and which have given rise to the assertion, "Thornless Blackberries produce more thorns than berries." There is little room for doubt but the "Thornless" of which I now write (see Fig. 133, p. 150) is a variety of the European species (Rubus fruticosus) and its canes are as free of thorns as willow twigs. It is the only truly thornless variety I have yet seen. In habit it is of vigorous but slender, drooping growth. Berries small, very dark purple or black, sparkling; are formed of many small drops closely wedged together, and are produced in the greatest profusion. It ripens quite early; the berries are sweet and rich but of a rather mawkish flavor. In hardiness it is quite remarkable, not having been injured the past severe Winter, even at the tips of its little wiry branches. On the whole, it is perhaps more ornamental than useful, although a claim of both may justly be made for it.

Little Silver, N. J. J. T. Lovett.

The Eumelan Grape.—Among all the grapes that grow in my collection (and I have tried many varieties the last thirty years), the Eumelan, or one that I bought for that grape, is one of the best for the table, for the palate and for the stomach. One may eat of it to fullness and no unpleasantness is felt. The stomach never loathes this grape, but, on the contrary, is soon ready for more. As a Winter grape, it is unsurpassed. It needs but little care to keep it nicely until Mid-winter. It keeps well lying on shelves and only covered with two or three thicknesses of paper. The room in which it is stored should be dark and cold, but not freezing. It keeps well in three or four-pound boxes. If packed in cork dust it will keep through the Winter. I left some in a room last Fall where they froze and thawed three or four times, and in December they were quite palatable. For keeping, this grape should be thoroughly ripened.

Glens Falls, N. Y. E. W. K.

STRAWBERRIES FOR FAMILY USE.

It seems strange that while the families of village and city people usually have a fair supply of this, the most delicious, the most healthful and most easily grown of all the small fruits, not one farmer's family in five has even a taste, of the cultivated varieties at any rate, to say nothing of a good supply through the season; and yet each family might have an abundance at one-half or one-fourth the price the villager has to pay for them. If you ask householders why they don't raise strawberries for their families, the most common excuse is that they cause too much trouble or cost more than they are worth. Nothing that is worth having can be had without some trouble and a crop of strawberries need not necessarily cost more than a crop of cabbages or potatoes. Wishing to know just how much it cost to raise a small plot, I kept an account of the expense of five square rods, on which strawberries were grown for family use last year. The plants were set early in the Spring of '79, in rows four feet apart, one foot apart in the rows. They were hoed and weeded out five times during the season, and the runners allowed to grow and root all they would, and the ground was nearly covered with plants by Fall.

EXPENSE.

Plowing and fitting land	$ .34
Taking up and setting plants	.38
Cultivating, hoeing and weeding	2.20
Commercial fertilizer	.50
Picking fruit	2.72
	$6.14

The plot produced 186 quarts of berries, which supplied a family of eight persons with an abundance through the season and left 65 quarts to be sold, which brought, at wholesale, 13 cents per quart, or $8.45—more than enough to pay for the work done on the whole plot. But, taking no account of those sold, our berries cost only about three and one-third cents per quart. No account is made of the plants set, because they were of my own growing and cost comparatively nothing; but supposing they had been purchased at the usual prices, the berries would have cost only about five cents per quart. It should be remembered that the same plot will probably bear a good crop this year, with no further expense except that for picking the berries and a dollar or two for fertilizer. I should add that the varieties were Downer's Prolific, Charles Downing and Kentucky; and if there are three more reliable sorts for family use that will cover the strawberry season and be so valuable in other respects, it remains, I think, yet to be proved. It is well to test the new varieties, and there is a good deal of pleasure in it, if one does not mind disappointment; but the main dependence had better be placed on the old well-tried sorts. L. W. Goodell.

Hampshire Co., Mass.

Caroline Raspberry.

I noted in a recent number of the Rural the remarks of some of your contributors in re-

gard to the Caroline Raspberry, and I wish to add my testimony as to its value. I received a few plants from the originator, Mr. Carpenter, two or three years since, and have been simply delighted with them. I find them entirely satisfactory, and a marvel in the way of productiveness. I have tested most of the prominent varieties, as well as the old and standard sorts, and a feature which I consider largely in the favor of this is, that persons who cannot eat the raspberry generally, find the flavor of this pleasant and agreeable. It has been a matter of surprise to me that it was not more extensively introduced, and more generally offered in the catalogues of the different nurseries. I trust the attention which it has received from the RURAL will result in its being more widely introduced. I write this, not in the interest of Mr. Carpenter, whom I do not know, but specially in the interest of the people who must be benefited by the extended introdnction of so good a berry as the Caroline.

Passaic Co., N. J. ALBERT TURNER.

SENECA QUEEN. Very productive—dark color when ripe. Early, juicy, soft. Page 147.

CAROLINE. Sent to us last Spring by John B. Moore to be tested. We shall be able to report next Summer. Page 151.

ENDICOTT'S SEEDLING. Sent to us last Spring by Mr. E. P. Roe. It seems to be a vigorous variety. Page 148.

KENTUCKY is, with us, very prolific even during dry seasons, ripening its fruit for a long time. The plants are as vigorous as any we have. The berries are sometimes twice the size of our engraving. This berry does well in Augusta, Georgia. Page 151.

FRENCH'S SEEDLING. From E. & J. C. Williams. Very large leaves—vigorous, prolific, of fair flavor. Page 151.

COWING'S SEEDLING (E P. Roe), planted in late May, made a good growth. Berry richly flavored, bright red, medium size. Page 148.

PHOTO OR MARTHA. Leaves large. Stems of both leaves and fruit notably short. Berry dark red, medium early, soft. Page 147.

Directions for Planting Strawberries.

FOR THE GARDEN.—One of the best methods is to plant in beds about four feet in width, leaving a walk between. Three rows may be planted in each bed set fifteen inches apart each way, the outer row being nine inches from the walk. By this method the beds need never be trodden upon.

RUNNERS.—If large berries are desired, runners should be cut out as they appear during the season. Thus new crowns are formed in the old plants for next year's fruit. Keep the ground clear of weeds and the surface mellow.

MULCHING.—Just before the fruit *begins* to ripen, cover the ground between the plants and about them with straw or freshly mown grass. This will protect the plants against drought and the fruit from the sand and soil which are spattered over them by rain.

FOR FIELD CULTURE—The matted-row system is generally adopted, as the cultivator and horse perform the labor. The rows should be not less than four feet apart and the plants 18 inches apart in the row.

"Glossy Cone."

IN our trial grounds last season we tested, alongside of this variety, about 30 kinds and by a careful comparison decided that the "Glossy Cone," had the greatest number of good points. The size is a full average; flavor equal to and somewhat resembling that of the old Triomphe de Gand; the form, as the name well indicates, is cone-shaped; color deep scarlet-crimson, having a gloss as if varnished, making it one of the most beautiful of all strawberries. It bears in the greatest profusion, and the fruit is thrown well up on strong fruit stalks. But its most valuable merit is earliness, in which, with us, it leads all others. We first observed its profusion of flowers, showing the rows white from end to end when the earliest of the other kinds only showed a flower here and there. It held to this early development all through the season, and we picked ripe fruit from it three days before any other sort, except Crescent which was equally early, but which in all respects is perfectly worthless with us.

PETER HENDERSON.

White Blackberries.

Having grown blackberries only in small lots, this may not be a fair comparison. Yet what experience I have had has been against the light-colored varieties. The

CRYSTAL WHITE, with us, is of a yellow, rather than white color; berry about half the size of Dorchester; rich flavor, and sweeter than most of the varieties; not productive; plant hardy, and a good grower: may do for the amateur who is after novelties, and is satisfied with a light crop.

KENTUCKY WHITE.—What few berries our plants have produced, were of a transparent white; berries not well filled out, plant not so hardy as Crystal White. I. J. BLACKWELL.

Notes from Charles Downing.

I have only seen the Bidwell Strawberry at Mr. Roe's once the past season, and know but little of it, only that it is of good quality and very promising.

I think the quality of the Duchess Grape is *very good*, at least. The vine is also a vigorous grower and a good bearer. I don't know enough of the Niagara to say any thing decidedly. The Prentiss, so far as I know it, is also of very good quality.

GRAFTING THE GRAPE.

FIGURE 143 is a cion cut as cions are usually cut in pear or apple cleft-grafting. Two cions may be inserted, one on either side, if the stock is large enough, or but one, as may be desired. Care should be taken to see that the inner bark, which is very thin in the grape, of the cion and stock is placed as nearly as possible in contact. The stock should be prepared as is elsewhere described by Mr. Burrows.

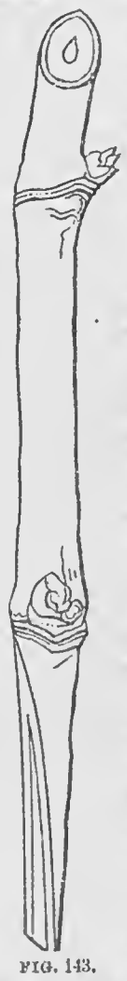

FIG. 143.

During a visit South last Spring to Tryon Mountain, N. C., we visited an old gardener who had met with entire success in grape-grafting, by the following method:—Cuttings of wild vines were made in late February or early March, with or without a heel of two-year-old wood attached, as shown in Fig. 144. These were grafted by cleft-grafting or by saddle-grafting, as shown, and both stock and cion were placed in boxes of mellow soil in the cellar. Here the cuttings (stocks) would form a callus in a few weeks, and in late April or May they were set out in nursery rows. We were also shown a number of old vines, some of which were two inches in diameter, that had been cut off within two feet of the ground. A vertical incision was made at the top and in this a cion, cut wedge-shape on one side as well as at the end, was firmly pressed until the bark of the stock and that of the cion were continuous. No bast or wax of any kind is needed in this kind of grape grafting,

A writer in the Gardeners' Monthly is quoted by Professor Husmann in his "American Grape Growing." The method is illustrated by Fig. 145. "After the first four or five leaves are formed, and the sap is flowing, you choose the place on the vine where you intend to graft. At that place, wrap tightly a twine several times around the vine. Below the twine, make a sloping cut down, as shown, and a similar reversed cut above, about one inch deep. In selecting a cion prefer one that has naturally a bend. Cut it wedge-shape at both ends and a little longer than the distance between the cuts in the vine (stock). Insert the cion, taking care to have the bark in contact securing it by a string in the middle to the stock, drawn tightly enough to force the cion

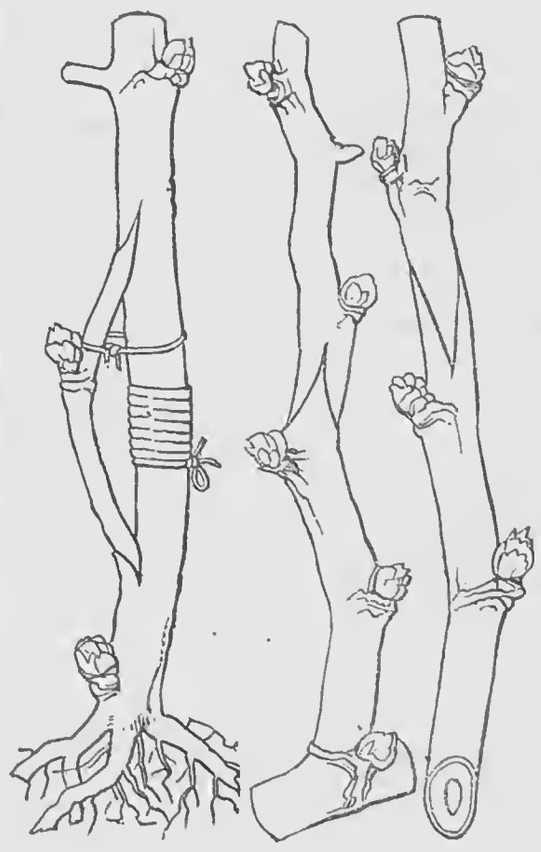

FIG. 144. FIG. 145.

ends into their places." The joints in this case should be covered with wax. The bud of the cion will soon grow, when by degrees all shoots of the stock and in the Fall the stock above the lower insertion of the graft, and the cion above the growth from the bud, may be removed.

GRAFTING THE GRAPE.

J. G. BURROWS.

This topic has been writen and rewritten about by ancient and modern authors until there seems but little, if anything, left untold; yet perhaps the results of my observation and experience on the subject may prove interesting to some of your many readers, and I offer them in the hope that they may to some extent benefit, at least, the beginner.

There are various circumstances which make it desirable to graft the vine; for instance, we may have some strong vines of a worthless variety, and by grafting them with an improved sort we cause them to produce fruit of greater value in much less time and in larger quantity than we could have obtained by replacing the old by young vines of the desired variety. Again, some of our finest varieties have either defective foliage or feeble roots, or they may be of delicate constitution, and by grafting them on some of the hardy and strong-growing sorts, we improve their condition sufficiently to enable us to grow them profitably for market. By adopting this method many of our vineyardists grow to perfection and at a handsome profit, such varieties as Allen's Hybrid, Rogers's Hybrids, Rebecca, Montgomery, etc.

There are several methods of grafting in practice, viz: splice-grafting, inarching, cleft-grafting, etc., the last being more generally in use, not, however, on account of its superior merit, I presume, but because it is the one form most commonly followed in grafting fruit trees. The vine is generally considered to be far more difficult to graft than most other fruits, and justly so from the fact that the bark is very thin, and the grain of the wood usually more or less crooked and gnarled, making it difficult to form a perfect-fitting joint. Vines of medium size make the most desirable stocks; but those of large size may be successfully grafted if they are vigorous and healthy.

To perform the operation, I remove the earth surrounding the crown of the vine down to the roots, and select that portion of the stock below ground which appears straightest in the grain of the wood; I saw off the top within three or four inches of the roots, and, having split the stock through the center, select for the cion a piece of the desired variety of medium size, short-jointed, with well ripened wood, consisting of two buds; if the wood should be long-jointed, then one bud only should be used. Beginning just below the bud, pare the cion to the shape of a rather long, slim wedge, to fit the cleft in the stock, and insert it by opening the cleft with a wedge or chisel and press it down firmly, being careful to observe that the bark of the stock and that of the cion match and cross each other slightly, in order that the cion may catch the rising sap, and thus sustain it till the union is complete. If the stock is small and does not hold the cion firmly in place, it should be secured by wrapping firmly with cord or wire. If the latter is used, care must be taken that it is removed about August 1st, or after it has made five or six feet of growth, otherwise it would eventually cut off the cion.

After the operation is completed a mound of earth about three feet in diameter sufficiently high to cover all except the top, should be thrown around the cion which should be protected on the sunny side by a half-inverted flower pot or board until it has formed a union and made some two or three inches of growth, when it should be gradually inured to the sun, and after a few days the protection may be entirely removed. Numerous suckers, or sprouts, will make their appearance from time to time from the crown of the stock, which must be removed or they will rob the cion of the required amount of sap and it will either perish or produce a feeble and sickly growth. To remove these superfluous shoots, a careful hand should be employed, as in the early stages of growth there is great danger of breaking off the young growth of the cion. In doing the work, carefully put aside the earth with the hand and take them off one by one. When all are rubbed off, replace the earth around the cion, covering it well up to the top of the old wood. This should be repeated as often as shoots appear.

There are several periods during the year when the vine may be grafted, and each has its advocates. Some prefer the early Spring; others are most successful in May when the vines have grown some three or four inches, and up to the early part of June. In this case, however, the cions must be kept in an ice-house or cold cellar to preserve them in a dormant state. The season generally adopted in this vicinity is early Spring—as early as the ground is fit "to work." Some of our vineyardists are very successful with this early grafting, one of my neighbors getting as high as 95 per cent. of the cions to grow, and many of them make from ten to twenty feet of growth, and produce a medium crop of fruit the second year after being grafted.

Dutchess Co., N. Y.

A CHAPTER ON GRAPES.

S. B. PECK, MUSKEGON, MICH.

IT is interesting to notice the different descriptions given of the same variety of fruit by different persons, both as regards the different likes and dislikes of flavor and successes and failures in the raising and marketing. Probably no grape is more generally a favorite, as to flavor, than the Delaware, especially in the minds of women and children, who are supposed to be more specially fond of sweets; still I lately heard a woman say, when offered nice Delawares, "No, I don't want them, I'd rather have the other." The other was the Concord.

Others admit the Delaware to be a nice, sweet grape, but say it doesn't pay for market, while a Western New-Yorker, who raises a great variety and markets them in Boston, gives preference to it for profit. Most persons like the flavor of the Iona, but many abandon it as too tender and uncertain, while a grower of large experience claims that he made a great mistake when he supposed that he could get a larger yield of Concords than of Ionas with the same care. The Clinton is generally claimed to be a poor, miserable, sour grape; but in setting a dish each of Clintons, Concords, Ionas and Delawares before a dozen school children for a trial of taste, a large majority voted for Clinton; and a young girl, who for a day was employed in preparing Concords for the press, and on the second day set to work on Clintons, said on tasting them, "Oh, these are a great deal better. —N. B. These Clintons were *ripe*.

Assuming that I, in common with the rest of mankind, have the right to differ in opinion from others, even though my opponents may be wiser than I, I proceed to express my opinion, my likes and dislikes of some of our more common varieties of grapes for the latitude of Central New York and Michigan.

I dislike the Isabella, Creveling and Adirondac, not because they are subject to disease, as sometimes charged, nor because of any special inferiority in quality, but simply because they do not bear enough to pay for their pruning and training. I dislike the Diana, not particularly on account of its flavor when ripe, but because it is subject to fits of barreness or excessive fruitfulness, causing it to fail to ripen in the latter case and to be worthless.

I like the Concord, not on account of its flavor, which to me is insipid, but because of its hardiness and productiveness, and, more especially, because the grape-eating public accept it and relish it as the "grape for the million" and hold on to it with a tenacity worthy of a better grape. I like the eight varieties of Rogers's Hybrids that I have tested (except No. 1, Goethe, which does not ripen), because of their vigor and hardiness, good size, peculiar saccharine flavor and fair but not excessive fruitfulness. In these there is much of a sameness in flavor and habit, though I have a choice in favor of the Salem for flavor and extreme hardiness, the wood always ripening to the extreme end of the smallest twig; but if you value extreme excellence don't let it overbear. It was first called Rogers's No 22, but latterly Rogers's 53—which is right? [Thomas says 22; Barry, 53—we do not know—Eds.] It ripens about with the Concord, and as to its number and name, were it as early as Rogers's No. 39 (Amenia) and Rogers's No. 5, I would number it "A No. 1," and name it "Seek-no-further." I know other grapes not worth mentioning, all having one fault like the Dutchman's horse "good for nothing"; still I am not sure but they, like crab and seedling apples for cider, would make the best of wine.

ERRORS IN DESCRIPTIONS.—The Salem is described by high authority as "the largest, most attractive and popular of Rogers's Hybrids"—the Wilder and Merrimac, Nos. 4 and 19, are larger. The Ives's was described as "too late for northern latitudes"—it ripens before the Concord. The Clinton, one of the slowest in its process of ripening, is described as "seldom good or even passable till ripened by frost"—not one word of which is true. The truth is that the process of ripening of this as well as of other grapes is a change of color and also a change of a portion of its acids to sugar, *glucose*, and if frost arrives before this process is completed it destroys or neutralizes a part of the acid, making it to the taste less austere but preventing it from ever ripening to perfection and destroying all its natural richness of flavor. Most persons may have noticed that a slight frost upon the naked potato gives it, when cooked, a sweetness of taste, the frost having changed a part of the starch to sugar—a change with which chemists are familiar.

TESTING NEW GRAPES.

WITHIN the past five years I have purchased about 50 of the newer varieties of grapes that have been so highly praised and so extensively advertised. If one-tenth of these new kinds prove desirable, I shall be agreeably disappointed. The cost of new plants is an important item, and to be added is the loss of space occupied by the vines during the years necessary to give them a fair trial. If, after finding them undesirable, we are obliged to remove them and set out others, much valuable time is lost.

To obviate this, in a measure, I set out new varieties alternately with other vines that are known to be valuable—as the Concord, Delaware, Salem, etc.; then by layering the best, one can easily and with comparatively little loss of time, fill the space from which the worthless kinds have been removed. New vines that cost three or four dollars each, are generally slow growers, therefore we can allow the better known varieties to occupy most of the room, until it is determined which we prefer.

I am of the opinion that in the general scramble after new grapes, we are likely to under-estimate the good qualities of many of the older kinds. While it is wise to spend a reasonable amount of time and money in the pursuit of better grapes, it is unwise to discard those that have already proved successful, until we are *very sure* that we have something better. The fact that a new kind of fruit is well advertised, is no proof that it is of any particular value. Perhaps the Champion has been more extensively advertised and more thoroughly puffed than any other grape, and yet it is probably the poorest that was ever offered to the public. We should judge more from the character of the persons offering new plants for sale, and not be caught by silver-tongued agents, or glittering advertisements. A person that has been engaged in palming off a worthless article, should never be trusted again.

People that are, in the main, honest, are sometimes deceived. They are so anxious that their new grape should be a desirable acquisition, that they can see more of its good qualities than others are able to discover. Again, what will succeed in one location, may fail in another, so that the best we can do is to keep on trying for better fruits, but to do so with due caution. NELSON RITTER.

SMALL FRUITS IN NORTH CAROLINA.

RASPBERRIES.—I have tried almost all sorts, but have never yet found any suitable to this climate or worth cultivating even for home use, save a few of the Black Cap varieties.

BLACKBERRIES.—None of the cultivated kinds pay for market purposes. The native kinds grow most profusely everywhere, and in some sections are sent to market, while in others they are dried in immense quantities.

STRAWBERRIES generally do well, the Wilson (if we do not include Miner's Prolific) taking the lead over all the thousand and one new varieties (or old ones with new names) that have been tested here. The berries would be extensively cultivated could we get cheaper express rates of transportation than at present prevail. Myself and one other rather extensive grower about six miles from here, are about all that now cultivate strawberries for the market, in this section. They prove, on the whole, anything but profitable after the first two or three shipments, coming then into competition with the low-priced fruit from Maryland and Delaware, so that with our present rate of express freight, we are obliged completely to abandon shipping before, perhaps, half of the crop is gone. Accordingly the cultivation of strawberries has a yearly tendency to become less, for anything beyond home use.

CURRANTS, whether white, red or black, after seven years' trial in all possible ways, I have, like previous experimenters, altogether abandoned, they proving utterly barren and useless through what seems to be mildew.

GOOSEBERRIES of the Houghton varieties do remarkably well and bear profusely. Only a few, however, are cultivated, and those merely for home use.

Grapes

I cultivate largely as they are almost a sure annual crop. Unlike peaches, they have never in my experience, been hurt by frosts with a single exception, and rarely does anything damage them in the least, provided those few sorts that are subject to rot, are excluded. I have now in bearing about 30,000 vines of about 20 varieties, and contemplate extending my vineyard to one or two hundred acres, if markets do not fail or become non-remunerative.

The varieties which constitute the bulk of my grapes at present are, Ives's Seedling, Hartford Prolific, Concord, Salem and Martha. Catawba, being almost annually more or less subject to leaf blight, I have discontinued propagating. Delaware (excepting in some seasons of leaf blight) does pretty well. It never rots; but I do not care to plant it extensively, having other kinds of equal, if not better, flavor and far more profitable. The following varieties of

ROGERS'S HYBRIDS, if not planted in too rich soil, (in which case they rot badly) do well:

No. 1 (Goethe), No. 15 (Agawam), No. 3, (Massasoit), No. 9, (Lindley), No. 19 (Merrimac), and a few others do well, sell quickly at good prices, being equal to or surpassing the Delaware in flavor. Salem does well if the wood is kept young; and it is splendid in flavor, and an excellent keeper, as is also the Diana; but its liability to partial leaf blight and consequent uneven ripening, to my great regret, prevent me from extending its culture.

MINER'S SEEDLING GRAPES I have now tested seven varieties of; but, as yet, I can speak approvingly of only one kind, viz., the Linden. This is a remarkably healthy, vigorous grower, and an abundant bearer. It is a little earlier than the Concord, of better flavor, and, unlike its parent, ripens its fruit properly and uniformly. With me it seems destined to supplant the Concord entirely, as the latter, in the most years, ripens its fruit so unevenly that an annual loss is sustained of nearly one-half the crop. Indeed here it is altogether a most undesirable and unprofitable shipping grape.

I am testing about 50 new varieties, but so far it remains for any that have fruited to show any superiority over old kinds, the fulsome eulogiums of their propagators and others to the contrary notwithstanding.

WHITE LADY does well and bears profusely berries of rich flavor as to sweetness; but the vine is such a miserable grower that I hardly care much to extend its culture.

JANESVILLE promises well in all respects, and is about five days earlier than Hartford. I expect to cultivate it very extensively.

MOORE'S EARLY, at present, I think but little of. It is very little earlier than Hartford and behind Ives's, and its flavor here is certainly inferior to that of the Concord.

CONQUEROR—promises well in all respects.

BLACK EAGLE I have discarded.

BRIGHTON proves here so poor a grower with no attractive properties either in bearing or flavor, that I have given it up.

WORDEN'S SEEDLING is very healthy, a luxuriant grower and profuse bearer; but it possesses the same fault as its parent—uneven ripening; and it is nearly as liable to crack in wet weather so that I hardly care to extend it.

CROTON after seven years' trial I have entirely abandoned.

ELVIRA, although a most healthy vine and profuse bearer, has such a compact bunch that half of its fruit ripens and cracks before the other half is ripe, and as it has a very insipid flavor I have entirely abandoned it.

EVA promises well.

BELVEDERE is one of the most luxuriant, healthy growers I have. It ripens with the Concord and more evenly; but it does not attract me sufficiently to further extend it, being smaller in berry and quite as tender as the Concord for shipping.

ARNOLD'S HYBRIDS are with me utterly worthless.

SENASQUA AND WALTER are splendid, rich grapes, but, what with the rather shy bearing qualities of the former and the tendency to wood blight in the latter, I shall not extend them.

UNION VILLAGE is utterly worthless in all respects.

EUMELAN is a splendid rich grape, is most profuse of bunches of large size, splendidly set until as big as buck shot, when they gradually mildew off (even if sulphured), until but a few straggling berries to a bunch are left—year by year repeated—I have given it up entirely.

TALMAN is exceedingly healthy, a luxuriant grower, and a profuse and constant bearer. Its foxiness, however, is a great drawback in my esteem, or I should cultivate it more extensively, especially as, unlike the Hartford, it does not lose its berries from the stem, and is about as early.

SENECA also does not drop its fruit, has a larger berry than Hartford, better flavor, and I think is destined entirely to supplant the latter.

ISABELLA bears profusely and has no foxiness as it has at the North. Some years it rots badly in others not at all. It is hardy and keeps its leaves finely.

I have on trial a great variety of the latest new kinds, including several from Commissioner Le Duc, most of them with unheard-of names; but their evident Vitis vinifera origin bears even at present a sure indication of their worthlessness here.

Special Wine Grapes.

I only cultivate Herbemont, Norton's Virginia, Cynthiana, Cunningham, Herrmann, Rulander, Northern Muscadine, Mary Ann, Winslow, Marion Port, Clinton, Rentz, Catawba, Scuppernong, and a few others on trial. Mixed to advantage with the above are Concord, Ives's Seedling, Martha, Pauline, and several other table grapes. These make wine as good as, if not better than, two-thirds of the French wines of which I have had experience during a residence of some years in France. Gallicized wines, however, or those well watered, sugared, alcoholized and bedeviled with dry essences and flavors, seem in this day and generation to please much better the perverted palates of eight-twelfths of the community than the pure juice of the vine, and so little are wines of the latter sort appreciated that I do not wonder that most of the makers, in order to effect anything like large sales, are driven to adopt the composition process; and in a great many instances, undoubtedly, wine dealers make up their so-called ports, sherries, etc., in their own cellars, without the aid of any kind of fruit whatever. HENRY SMITH.

Buncombe Co., N. C.

NEW ROCHELLE RASPBERRY.

I WAS very much interested in the articles referring to the New Rochelle Raspberry in the RURAL of February 5th. Having fruited it for the past three years, I consider it a very valuable variety. The plant with us is a strong, rampant grower, not quite hardy, and fully twice as productive as any red variety in cultivation, and, as it is only a little darker in color than the Philadelphia, we thought it would sell well in any market where that variety would. We, therefore, made quite a plantation of them, and for the past two years have had a fine supply of fruit for market. The first lot, picked two years ago, was gathered between six and eight o'clock in the morning and by ten o'clock the berries were in market. At noon I called around among the dealers where we had sent them, and all wanted to know if I thought they could sell such old, moldy berries as those, and I had hard work to convince them that they were fresh-picked and that what they mistook for mold was the natural bloom of the fruit. They, however, could not make their customers believe it, and so I left orders the next morning to give the fruit away among their customers, hoping in this way to introduce this variety; but I soon found that while we could give them all away one day, it was hard work to sell very many the next, the objection being to their color and not to the quality of the fruit. (When will people learn to use something besides their eyes in buying fruit?) After giving away and trying to sell for a week, the ladies of our family began canning them, and then we found that was the proper mode of disposing of them, and so we offered them in market as a canning berry, very much to the satisfaction of our customers, as shown last season by a number of letters received from families, asking to be supplied with the same variety, one lady saying they were the best canned raspberry she had ever had.

From our experience I consider it a very prolific and valuable variety for the family garden, but I would not now recommend people to plant it for market, except in a small way, until they find if it will sell in their market. If it will, then "go in for it strong," "there is money in it."

South Glastonbury, Conn. J. H. HALE.

GRAPES AND SMALL FRUITS IN TEXAS.

THE culture of small fruits is not practiced to any great extent in Southeastern Texas. This is attributable, first, to the uncongeniality of the climate, and, second, to the competition in the market, which the cultivated fruit has to meet from the Wild Dew Blackberries in their season, which are sold very cheap and sometimes entirely glut the market. Gooseberries, currants and the finer sorts of raspberries are an entire failure. The bushes gradually die the first or second year after planting.

Strawberries can be raised only on the annual plan; that is, the suckers are planted out either during late Fall or Winter for the scanty crop they will bear the following Spring. After bearing, the stool plant will die during Summer, and the plantation has to be renewed from the strongest suckers for the following season. Only a few varieties will bear anything like a crop cultivated in this manner, and among these the old Wilson is still without a peer. Among the newer kinds it has found a rival in robustness, though not in productiveness, in the Crescent Seedling. This will throw out vigorous suckers, while most of the other sorts will generally succumb to a long, hot Summer season, protracted longer than their natural ability can endure.

No grapes of the Labrusca variety will succeed here, and for the coming grape we have to look to and try to improve those kinds that spring from the Æstivalis species. Indeed, there is already a variety of this last class met with in this vicinity, without name, which bids fair to fill the place here of the Concord, "the grape for the million," from which million we are unfortunately excluded. I ought to mention the Scuppernong, but I hardly think this single-berried bush, the fruit of which consists of a leathery, tough skin and an indigestible pulp, deserves to be mentioned among cultivated grapes. It has, however, one, and only one, thing to commend it—that it is the "lazy man's grape." G. MARTI.

Harris Co., Texas.

A GOOD BLACK CAP.

THE Davison's Thornless is one of the best Black Caps. Any one who has grown the Doolittle and kindred sorts can appreciate the difference between having one's hands and face torn and bleeding, his clothing in tatters, and being able to escape with sound clothing and a whole skin. The Thornless is very early—an important consideration in some localities. In our local market the first raspberries sell for nearly double the price of the later berries; this, therefore, has proved, with me, far more profitable than the later kinds.

In consequence of its small growth, the plants should be set closer than the larger kinds. I set the rows four and one-half feet apart, two and one-half feet in the row. Set in this way the yield will at least equal that of any other variety known to me. The past season I picked from one-seventh of an acre, set in 1878, 440 quarts, or at the rate of about 95 bushels to the acre. They should yield still better the coming season, as they do not get to their largest growth until about the fourth year. The branches are not as badly broken off by the snows as are those of the larger and coarser kinds—at least, this has been my experience.

Will the RURAL readers who grow raspberries state what they consider a fair crop? I think that 50 bushels per acre (7,600 quarts) make about as large a crop as can be depended upon, one year with another and under all circumstances.

Onondaga, Co., N. Y. N. R.

THE KITTATINNY BLACKBERRY.—Unlike others the turning black of these berries is no indication that they are ripe, for they are frequently hard and bitter to the taste while perfectly ripe to all appearance, yet needing only a few more days upon the vines to acquire a delicious flavor and a melting juiciness. When picking them, a gentle pressure with the thumb and finger soon teaches one to distinguish the ripe from the unripe berries, and when their value has been really learned—coming as they do at a time when other berries are gone—no one will readily dispense with the row of Kittatinnies in his garden. E. K. B.

THE NEW ROCHELLE RASPBERRY.—You could not have done a better thing than praise the New Rochelle Raspberry. All last year I said to my visitors, "Here is my pet, my wonder—half Blackcap and half red—a wonderful bearer and really a good fruit." But, furthermore, it ought to be the point of a new line of berries, as La France leads off a new class of roses. It must not be neglected by experimenters. I shall, for one, try seedlings from it. E. P. P.

Oneida Co., N. Y.

THE SHIRTS STRAWBERRY.—Mr. Roe last Fall left two strawberries of the new kind called Shirts, which has, previous to this number, been several times referred to in these columns. These were drawn and engraved, and the pictures are presented on page 148. Mr. Roe says that the fruit is generally more conical. Our plants are strong and healthy. The flowers are perfect.

THE CAROLINE RASPBERRY.—FROM LIFE.—FIG. 146.

POT-GROWN VINES.

I NOTICE in the issue of January 15th some remarks on pot-grown vines. Your correspondent wishes to know if a vine grown in a pot is superior to one grown out of it—why it is so, etc.? Having had some twenty years' experience in growing grape-vines from cuttings after nearly all of the various methods, this experience has convinced me that the best method, all points considered, is briefly as follows:

Having cut the wood in suitable pieces of one bud each, of about an inch and a-half in length, after the usual form termed single eyes, the pieces are placed in sand about April 1st, over a steady bottom heat of 60 to 65 deg., either in a forcing-pit or in a hot-bed. Thus treated, they should form roots in about 30 to 40 days, according to the varieties. As soon as the roots have attained a length of one or two inches, they are potted in two-and-a-half inch pots and grown under glass till the weather has become sufficiently warm and steady—say about June 15th—when they are planted in the open ground in rows two feet asunder, and six inches apart in the rows, and kept scrupulously free from weeds. Cuttings so treated in ordinary seasons and in fairly fertile soil, will attain a diameter of a quarter, to three-quarters of an inch at the close of the first season's growth, with an abundance of roots two to three feet in length. Such vines, in my opinion, are far superior to the best pot-grown vines I have ever seen. Vines so grown have longer and stronger roots with heavier, shorter-jointed, riper wood and fully matured, and are equal if not superior to those grown after any other method, and greatly to be preferred to vines grown in pots.

In the same issue and under the caption "Do Bees Puncture Grapes?" I noticed a very interesting article. I would render the same verdict as your interesting correspondent, and the causes of ruptured and unsound grapes pointed out by him are correct without a doubt. Any person in doubt about the matter may easily satisfy himself as to the untenable charge that the bee punctures grapes, by watching it carefully when the grapes are beginning to ripen. Bees do feed on grapes and, in fact, on all sorts of fruit containing sugar; but in every case the skin is first broken by other causes and not by the honey bee, as many suppose.

The Literary Revolution.
Change of Base.

This very remarkable enterprise continues to make such progress as to astonish its friends and astound its enemies. Its greatly increasing proportions have compelled the removal of its headquarters from the Tribune Building to the very large and beautiful building, No. 764 Broadway, which is in the very midst of the "book district" of New York City, and, therefore, of the publishing enterprise of the nation. This building, though six stories in hight, 25 feet front and 100 feet deep, is sufficient only for the offices and retail store of the Company. The manufacturing is carried on in several large buildings located in other parts of the city, though it is contemplated concentrating them soon in one immense factory to be erected.

The announcements which are made elsewhere are extremely interesting to all who enjoy what is choicest in literature. The Library Magazine is unique in both form and character and altogether delightful in the richness of its contents. Of the books announced, Green's larger "History of the English People," reduced from $10 to $1; Carlyle's "History of the French Revolution," reduced to 40 cents; Carlyle's "Heroes and Hero Worship," 25 cents, and the "Revised New Testament," which is promised to be manufactured with rapidity heretofore unheard of, will attract special attention. It is worth while for every one who has not already seen it, to send and get the illustrated pamphlet, "Book Making, and Type Setting by Steam," which will be sent free upon application. Address, the American Book Exchange, 764 Broadway, N. Y.

A Pure and Effective Hair Dressing.

Cocoaine, a compound of Cocoanut Oil, beautifies the hair and is sure to allay all itching and irritation of the scalp.

THE superiority of **Burnett's Flavoring Extracts** consists in their perfect purity and strength.

Guaranteed Strictly Pure.
Our Circular, containing facts interesting to Farmers, furnished on application.
H. J. BAKER & BRO., 215 Pearl St., N. Y.

STOCKBRIDGE
MANURES
SEND FOR PAMPHLET.
These manures are the richest fertilizers now manufactured, and the best substitute for, and costing *much less* than guano, which is now practically out of the market. Unlike guano, they *are not stimulants* and *exhaustive*, but *permanent* and *lasting*, being composed of bone, potash, etc. You can draw at one load enough for 3 to 5 acres, or as much plant-food as is contained in 20 loads of ordinary straw manure. Corn, potatoes, hay, etc., are bringing such good prices that it will pay to use the Stockbridge extensively. If there is no local agent near you, send to us.
BOWKER FERTILIZER CO.
BOSTON & NEW YORK.

The Literary Revolution.

This most remarkable revolution of the century is now generally recognized as being also the most successful. Started in September, 1875, in a little room about six feet square, with a cash capital of $70 and a few nearly worthless old books, in 1880 it published over one million volumes of standard books, and during 1881 it will issue not less than two million, and in all probability more than three million volumes. It publishes only works of the very highest class, such as are recognized to be *necessities* to the library of every intelligent person.

Change of Base!

The head-quarters of the Literary Revolution, in the Tribune Building since January, 1880, having become very much too small for the vastly increased business, are removed to and now occupy entire the magnificent six-story iron and brick building, No. 764 Broadway. Retail sales rooms will be continued in the Tribune Building. The manufacturing departments will, for a short time longer, be confined to the large buildings Nos. 18 Spruce street, 26 Beekman street, 33 and 35 Vesey street, and 62 and 64 Duane street, until we are able to erect factories and concentrate in one place the largest book manufacturing enterprise in the world.

The Library Magazine.

The Library Magazine of American and Foreign Thought, undertakes to occupy so high a stand that it shall be considered an indispensible part of the library of every American who aspires to the broadest culture, and to keep fully abreast with American and Transatlantic thought. The contents of any number will indicate how well it succeeds in this ambitious attempt. In consonance with the maxim "what is worth reading is worth preserving," it is issued in bound form only, and not in paper covers, as is the custom with magazines. Volume 7 just ready; over 400 pages, containing an amount of literature, of the very highest class, more than three times as great as found in any issue of the $4 monthlies. Price, elegantly bound in extra cloth, 40 cents. In half Russia, gilt top, 60 cents. Postage, 6 cents.

TABLE OF CONTENTS.

More New Books.

New Books are being added to our list with a rapidity unexampled in the history of publishing. Recent and early forthcoming issues are—Green's Larger History of England, reduced from $10 to $1; the Revised New Testament, an elegant edition in large type, to be issued within 24 hours of the arrival in this country of the English edition, price 30 cents; Carlyle's "French Revolution," reduced from $3 to 40 cents; Carlyle's "Heroes and Hero Worship," reduced from $1 to 25 cents; Carlyle's translation of Goethe's "Wilhelm Meister," reduced from $1.75 to 35 cents; Lossing's "Eminent Americans," over 100 portraits, very elegant, price $1; Trumbull's celebrated historical and satirical poem of the Revolution, "McFingal," with very full annotations by Lossing, very elegant, price 50 cents; Charlotte Bronte's "Jane Eyre," 35 cents; Mrs. Mulock Craik's "John Halifax, Gentleman," 35 cents; Tasso's "Jerusalem Delivered," very beautiful, 40 cents; Irving's "Sketch Book," 35 cents; Irving's "Knickerbocker," 35 cents; Creasy's "Fifteen Decisive Battles of the World," 35 cents. The above elegantly and strongly bound in cloth at the prices named; most of them issued in half Russia, gilt top, at higher prices. Descriptive catalogue sent on request.

Paxson & Co.; in smaller towns the leading bookseller, only one in a place.

THE MAPES COMPLETE MANURES

Special Manures for Small Fruits, Fruit Trees, Early Vegetables and General Crops.

SAMUEL McMILLAN, SYLVAN LAKE, ORANGE CO., FLA., reports Nov., 1880:

"Have used the Mapes Fruit and Vine Manure for several years, with the very best results—applied at rate of 800 lbs. per acre—the trees 8 to 9 years old. I also used it on younger trees and it caused them to take on a *vigorous, healthy growth*. The effect of the Mapes Manures has been *more lasting* and satisfactory than any other Orange Tree Manures that I have used."

H. S. KEDNEY, MAITLAND, ORANGE CO., FLA., Reports Nov., 1880:

"I have purchased of The Mapes Co., nearly all of my fertilizers for the past seven years, and have found the Mapes Complete Manures to be superior to all others for growing market truck and vegetables. Have used the Mapes Orange Tree Fertilizer, and would recommend it as the *most suitable* for the Orange Tree. I have under cultivation, for myself and others, ten thousand trees, in all stages of growth, and I propose to use no other fertilizer in the future."

WM. FRANCIS BUCKNOR, DE LAND, VOLUSIA CO., FLA., Reports Nov. 10th, 1880:

"My experience for the past three years in using the Mapes Complete Manures for Orange Trees and Truck has been very satisfactory. Have received splendid returns."

PEAR TREES, ROSES, ETC.

WM. A. BURGESS, the well-known grower of premium "Marechal Neil" Roses and Flowers, writes:—
May 5th, 1879. Dosoris, Glencove, L. I.
"Please ship me the Fruit and Vine Manure and the Greenhouse Bone Manure ordered of your Long Island representative as quickly as possible. I am anxious to apply them."
In answer to your inquiry whether these fertilizers have fulfilled expectations, I may say that they have done so completely. The Fruit and Vine Manure, applied in the Fall to young Pear Trees, produced a growth of new wood the following season *exceeding anything I ever saw*, some of the new branches being five feet in length. The trees fruited admirably, and, to sum up the matter, I am convinced you have hold of the only correct ideas in this branch of fruit culture. As you are aware, I claim precedence as a grower of Marechal Neil Roses, taking first premium wherever they are shown. No small share of my success I attribute to the liberal use of your specially prepared Greenhouse Bone Manures, used by me for some years past. Its effects also on choice flowering plants are wonderful, and it is perfectly safe in application.

Raspberries, Grapes, Strawberries, Currants, Pears and Peaches.
300 perfectly formed strawberries upon a single plant (Wilson variety).

Report of C. A. Valentine, the well-known practical Fruit-Grower.

MILTON, ULSTER CO., N. Y., Nov. 1st, 1879.

RASPBERRIES—70 bushels from three-fourths of an acre.
I applied 375 lbs. of the MAPES FRUIT AND VINE MANURE upon three-fourths of an acre, sown broadcast between the rows (in April) and immediately cultivated in; land a staty knoll, naturally very poor; the growth of new canes was large, and the bearing canes completely filled with blossoms, and upon picking, my pickers remarked upon the unusual size of berry, comparing them to the "Hudson River Antwerp" (mine being the "Highland Hardy") which was very complimentary to the Hardy; yield was 70 bushels.

GRAPES.
I applied the Fruit and Vine Manure broadcast, to a few vines experimentally; they were vines that had failed to make sufficient wood. The new growth was all that I could wish, and I shall apply generally to my grapes next Spring, apply broadcast and cultivate in with cultivator.

STRAWBERRIES, CURRANTS, PEARS AND PEACHES.
I applied the Fruit and Vine Manure at the rate of 800 lbs. per acre, making a drill about *five inches* deep, sowing the fertilizer in drill, incorporating it thoroughly with soil by leveling drill, leaving a smooth bed to set plants, with trowel by line. Results have been large, enlisting the attention of many fruit growers in the neighborhood who came to see the large results. I have counted 300 perfectly formed strawberries upon a single plant of the Wilson variety. I have used the Fruit and Vine Manure satisfactorily upon Currants, Pears and Peaches also. I think the brand is truly named as being THE MANURE for fruit of all kinds, and when you consider the ease of application, the entire absence of weeds, the quick returns, and the small cost per acre it is proof positive, that it is *the* fertilizer to use.

BRIC-A-BRAC.

DR. BOYD was once asked how it was that he consented to the marriage of his daughter to a Presbyterian. "Well," he replied, "as far as I have ever been able to discover, Cupid never studied theology."

AN ordinary woman's waist is thirty inches around. An ordinary man's arm is thirty inches long. How admirable are thy works, oh nature! —Hawkeye.

BEFORE the lofty church I stand;
The organ's melancholy strain,
The moonlight, and the chanting tones
Weave strange thoughts in my doubting brain.

Why do I linger near the door?
Will holy tunes my spirit win?
Ah, no, small reverence is mine;
I wait because my love's within.

A YOUNG lady was speaking to a friend who had called upon her regarding a trait characteristic of her mother, who always had a good word to say to every one. "Why," she said, "I believe if Satan were under discussion mother would have a good word to say for him." Just then the mother entered and was informed what the daughter had said, "whereupon she quietly said: "Well, my dear, I think we might all imitate Satan's perseverance."

WIVES of great men all remind us
We may have our wives sublime,
And, departing, leave them behind us
Widows worthy of our time.
Therefore give your wife a send-off
By the life insurance plan;
Fix her so that when you glide off
She can scoop another man.

RULES OF THE HOUSE.

AT an Oil City hotel boards a father and son The latter has been in the habit of staying out later than his father liked, and one day the latter said: "My son, the rule of this room hereafter is that every person must be in before ten o'clock, or else remain outside."

"Yes, sir," said the obedient son.

A night or two afterward the father was detained by his business until nearly eleven o'clock, and, on reaching his room, found the inside bolt drawn. He knocked and was soon answered with: "Who's there?"

"Your father; get up and let me in."

"See here, the rule of this room is that every person must be in before ten o'clock' or stay outside. Now don't make any more disturbance about here."

The father slept in another room that night.—Oil City Derrick.

Real Estate.

Fruit Farm for Sale.

Situated 1½ miles South of Highland (opposite Poughkeepsie) containing 70 acres. Apple and Peach orchards, Currants, &c. In the center of the finest Fruit Growing Region on the Hudson. Good house and outbuildings.

PURE SUGAR CANE SEED

The undersigned keeps a supply of Early Amber and Early Orange cane seed, the product of different latitudes; hence adapted to various climates. The Orange is especially recommended for sugar making and for districts subject to hot sun in July and August. It has received the indorsement of the Mississippi Valley Cane Growers' Association at its late meeting.

Prices of seed at St. Louis: Early Amber, by mail, 3 pounds, $1; by express or freight per pound, 15c.; large lots, 10c. Usual discounts to the trade.

Early Orange, by mail, 2½ pounds, $1: by express or freight, per pound 20c.; large lots, 15c.

Kansas Orange, for northern culture, prices same as Early Orange.

No orders filled for less than $1. Remit by draft money order or registered letter.

Caution must be taken in selecting Orange seed, as when cleaned, none but an expert can detect it from some other variety, and the desire to speculate may induce some to mislead by selling other seed as Orange. It was for this reason that I had placed this seed in reliable hands last season for cultivation, in order to secure reliably pure seed for my trade.

ISAAC A. HEDGES,
2004 Broadway, St. Louis, Mo.

SEEDS

I will give you the best Seeds for the least money of any firm in America or refund. Western Seeds are best. Mine take the lead. Gardeners say they never fail. I used 6000 lbs paper to print 50 000 pretty Catalogues Illustrated with $2000 worth of engravings. It beats the world, worth many dollars, FREE. Prices below all. R. H. SHUMWAY, Rockford, Ill. Best Seeds cheap pretty Book Free.

PERSONAL ITEMS.

Randolph Tucker, of Virginia, is the handsomest man in the House of Representatives.

Secretary Schurz's journalistic property in St. Louis is said to yield him $12,000 a year. He is endeavoring to obtain a suitable house there for his future residence.

Senator elect Ben Harrison, of Indiana, is rather exclusive in his habits, but is popular and companionable. He has a great deal of self-respect and never loses in dignity.

Vice President-elect Arthur is in Washington endeavoring to make himself familiar with the technical duties of his office and with personality of the Senators over whom he is to preside.

[Sparta, (Wis.) Herald.]

As an exhibition of the intrinsic worth of St. Jacobs Oil, we think the case referred to, that of Mrs. O. W. Hubbard, of this town, cured of Sciatic Rheumatism of long standing by the Oil, is certainly striking, and, beyond all doubt, conclusive as to its efficacy. The remedy has our endorsement.

Trees, Seeds, Plants, &c.

CUTHBERT RASPBERRY

Of this incomparable variety I have much the largest and best stock in the Country. A large stock also of **CRECC**, Turner, Herstine, Franconia, Caroline, Reliance, Brandywine, etc.

KIDNEY-WORT

The Only Remedy

That Acts at the Same Time on

The Liver, The Bowels and The Kidneys

This combined action gives it wonderful power to cure all diseases.

Why Are We Sick?

Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.

KIDNEY-WORT WILL CURE

Biliousness, Piles, Constipation, Kidney Complaints and Diseases, Weaknesses and Nervous Disorders.

by causing free action of these organs and restoring their power to throw off disease.

Why Suffer Bilious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?
Why have sleepless nights?

Use KIDNEY-WORT *and rejoice in health. It is a dry, vegetable compound and* One package will make six qts of Medicine. *Get it of your Druggist, he will order it for you. Price, $1.00.*

WELLS, RICHARDSON & CO., Proprietors, Burlington, Vt.
(Will send post paid.)

Liquid KIDNEY-WORT

In response to the urgent requests of great numbers of people who prefer to purchase a Kidney-Wort already prepared, the proprietors of this celebrated remedy now prepare it in liquid form as well as dry. It is very concentrated, is put up in large bottles, and is equally efficient as that put up dry in tin cans. It saves the necessity of preparing, is always ready, and is more easily taken by most people. Price, $1 per bottle.

LIQUID AND DRY SOLD BY DRUGGISTS.

The Spring Wagon and Buggy Department is entirely separate from the Farm Wagon shops. And for the manufacture of this class of work we have facilities unsurpassed. Send for Catalogue and Illustrated Price List.
MITCHELL, LEWIS & CO., Racine, Wis.

A Sensible Precaution.

Though disease cannot always be conquered, its first approaches can be checked. But not only is the use of a medicinal safeguard to be recommended on the first appearance of a malady, but a wise discrimination should be exercised in the choice of a remedy. For thirty years or more Hostetter's Stomach Bitters has been the reigning specific for dyspepsia, fever and ague, a loss of physical stamina, liver complaint and other disorders, and has been most emphatically indorsed by medical men as a health and strength restorative. It is indeed a wise precaution to use this sovereign fortifying agent and alterative in the early stages of disease, for it effectually counteracts it, if the malady belongs to that large class to which this sterling medicine is adapted. Not only is it efficacious, but pure and harmless.

THE COMING STRAWBERRY.

The Bidwell. AS LARGE, FIRMER, BETTER FLAVORED, MORE PRODUCTIVE, AND MUCH EARLIER THAN THE SHARPLESS. After trial on various soils, I regard THE BIDWELL as the best. I have bought all the stock in the market and it is so limited that I can sell only in very small quantities. Order promptly before it is exhausted. I also offer a superb stock of the **Cuthbert Raspberry.** Send for Price-List. Address,

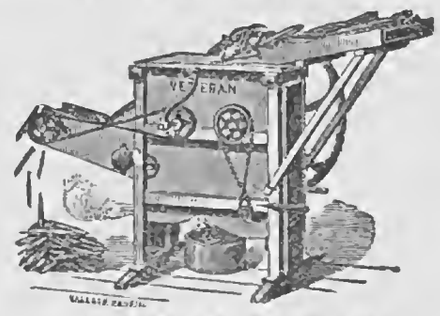
Veteran Corn Sheller



FOR HAND OR POWER.
Just the thing for Mill, Farm and Plantation.
Power and Hand Corn Shellers of all sizes and to suit all wants.
HORSE POWERS, JACKS, Etc.
Write for Descriptive Circulars and prices. Address SANDWICH MANUF'G CO., Sandwich, Illinois.

A GOOD SAW MILL For $200.
Our No. 1 Plantation Saw Mill is designed to be run by 8, 10 or 12 horse-power Agricultural Engines. With this power from
1,500 to 4,000 Feet
of lumber can be cut in a day. A product 25 to 50 per cent. greater than can be cut with any reciprocating saw mill. The mills are complete except saw, and will be put on the cars in Cincinnati for the low price of $200, and warranted in every particular. Saw Mills of all sizes. Engines and Boilers, Shafting, Gearing, etc.
Illustrated circulars sent free.
LANE & BODLEY CO.,
JOHN AND WATER STS.,
Cincinnati, O.

THE GENUINE
BLANCHARD CHURN
GET THE BEST
Five sizes for Family Dairies. Four sizes for Factory use. All our goods are of perfect stock and the best workmanship. They are strong, simple, efficient, convenient and durable. They continue to be the Standard Churns of the Country.
We now furnish either Round or Square Top Churns, of the Family sizes, as may be preferred. Prices of both styles the same. Send for Circulars of our *improved* Round Top Churn.
Our Churns received the highest Premium at the International Dairy Fair, in New York City, in 1879, in competition with all the leading Churns in the market.
Send either to any Dealer in REALLY first-class Dairy Implements for a Churn or Descriptive Circular, or to the Sole Manufacturers, PORTER BLANCHARD'S SONS, Concord, N. H.

BIG GIANT CORN MILL.
Every Man His Own Miller.

The only Mill that will grind Corn with Shucks on without extra expense. The only Mill grinding Corn and Cob successfully that will grind Shelled Corn fine enough for family use.
Grinds twice as fast as any other Mill of same size and price. Manufactured by
J. A. FIELD, SON & CO.
922 N. 2d St., St. Louis.

NURSERY FOREMAN WANTED! One who knows how to propagate and grow all kinds of first-class nursery stock. Address with reference P. O. Box 1643, Philadelphia, Pa.

CUTHBERT RASP Berry.
E. P. ROE makes such a remarkable *liberal offer* of this celebrated raspberry with his superbly illustrated book "Success with Small Fruits" that all having country homes should accept it. Descriptive Catalogue free.

THE RURAL NEW-YORKER

Ralph Ferris

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XL. No. 11. WHOLE No. 1624. | NEW YORK, MARCH 12, 1881. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Field Crops.

ON THE GROWTH OF CORN AT THE RURAL EARM.

J. B. LAWES, LL. D., F. R. S., ROTHAMSTED, ENGLAND.

THE RURAL NEW-YORKER of the first of January of this year contains the result of some experiments upon the growth of corn, tried in three fields of the Rural Farm. The yield in all was immense. Some of the corn was grown with manure, the composition of which is not given; some without any manure whatever, and, as the product of the latter amounted to nearly 70 bushels of shelled corn per acre, [the lowest of the three fields.—EDS.], it is evident that the soil and season were equal to produce such a crop by tillage operations alone. Further, reference is made in the article to fields in the neighborhood manured with very large quantities of dung and artificial manures, which did not produce larger crops than the unmanured land, and not nearly so large as the manured land of the Rural Farm. A question is then raised with regard to the source of these great crops, which may be put in the following form: Of the sum of the various forces employed in the production of the crop, assign to each its respective value? I think every one will allow that, when this question can be answered correctly, we may consider that Agricultural Science has made some progress.

Corn is a giant among the other grain crops, and for me has a peculiar fascination. I have already called attention in this journal to the remarkable advantage which corn possesses over the other cereal grain crops, in that it continues growing throughout the Summer, and ripens in the Autumn, but, at the time of writing, I was not so fully impressed as I now am with the great value of temperature for the production of nitric acid in the soil.

With corn the most vigorous growth and the most active assimilation of food take place just when nitrification is most active, but when the other cereal crops have done their work. No wonder then that the average yield of corn is much above that of other cereals. At the same time, although corn has access to sources of food in the soil, which are not available for other grain crops, still the food itself must come out of the soil. I will examine into the antecedents of the two fields in the Rural Farm to see if they will give me any assistance in supplying an answer to the question put in the RURAL NEW-YORKER, viz.: "Here we have an unusually fine crop of corn, without any manure, to what is it due?"

The article commences by stating that one of the fields, and that which gave the largest yield, had been *lying idle* for fourteen years, and the other for seven years. Now there is no such thing as idleness in nature; directly the last crop is carried off, she sets to work to cover the soil with vegetation; this vegetation dissolves the mineral matter of the soil, stores up the nitric acid, and as it dies gives off to the corn the food it had accumulated in the seven or fourteen years of its existence. At the present moment, the question as to whether the soil absolutely increases its stock of nitrogen while at rest—that is to say, while it remains covered with perennial vegetation— is not quite settled by us; but that a very large quantity of nitrogen becomes stored up and readily available for use when the vegetation is destroyed, is quite certain. To give an example, I may here say that the total quantity of dry vegetable matter, taken from a field where a large crop of barley had been mown, amounted to 1,300 pounds per acre; and of this more than half was stubble and growth above ground, as the underground roots to the depth of 27 inches did not exceed 700 pounds. Further, on a piece of grass land which was in arable cultivation twenty years ago, the first nine inches of soil from the surface contained 10,000 pounds of dry vegetable matter. Nature has not been idle either at Rothamsted or upon the Rural Farm. Weight for weight, the despised daisies and "Quack" would contain more nitrogen than the corn crop grown; and aided by a good tillage and a favorable season the rapacious corn would easily dispose of the accumulation of food stored up as the result of the toil of many years.

TOBACCO CULTURE IN CHEMUNG CO. NO. 2

G. GOFF, JR.

THE SOIL AND ITS PREPARATION.—Three kinds of soil are employed for tobacco land in this county; first, the low lands adjacent to the river, which are composed in large part of alluvial sand; second, a belt situated a little back from the river, and consisting of a rather heavy clay loam of great natural fertility, entirely free from gravel, and underlaid with a compact subsoil, and, third, a drier, more elevated and lighter soil usually gravelly, underlaid with clay, but of less average fertility than the second class. Tobacco is chiefly grown on the two latter kinds of soil, which, having a good natural drainage and at the same time a subsoil which entirely prevents the leaching of the surface soil, seem admirably adapted to the requirements of the tobacco plant.

The heavy clay loam, being more naturally fertile than the gravelly loam, produces the heaviest crops, and in some instances as much as 2,500 pounds of leaf have been grown on a single acre. The gravelly loam, while it does not produce quite so heavy a yield per acre, on an average, is considered to yield the better quality of leaf. The alluvial sand lying adjacent to the river, produces a very fine, silky leaf when thoroughly fertilized with stable manure; but it is not much used for tobacco owing to the light-weighing qualities of the leaf, which make it less profitable for the grower than the clay or gravelly loams, and the fact that it is usually very foul with weeds and weed seeds, brought on by the annual overflow of the river.

Our best growers consider that no crop which they can grow, will better repay a thorough and careful preparation of soil than tobacco. Without a thorough preparation—by which I mean making the soil fertile and friable by a sufficient quantity of manure and loose and mellow by sufficient cultivation—the best results either in quality or yield of the crop cannot be expected. It is true an occasional good crop of tobacco is produced from sod ground or soil not properly prepared; but it is the exception, not the rule. The best preparation of soil for tobacco is a thorough summer-fallow the season previous to setting the plants. At the same time the ground should be manured by as heavy an application of barnyard or stable manure, as can be obtained, remembering the more manure the more tobacco and the better the quality, other things being equal. The frequent plowing and harrowing necessary to a *thorough summer-fallow* pulverize the soil, free it of weeds, and mix in the manure well, which is the best possible condition of soil for the requirements of the tobacco plant. Sometimes it is not practicable to give soil intended for tobacco a summer-fallow. Where this is the case, let the nearest possible approach to it be made. If sod ground *must* be employed, let it be plowed as early in the Fall, previous to the season of setting the plants, as possible, so that the sod will have time to become partially rotted by the time the young plants are set in the field. Mr. Brant, a noted grower in our county, has grown good crops on stiff sod ground, by plowing it rather deep the previous Fall, as above stated, and cross-plowing it shallow the following Spring, thus forming a mellow surface for the plants. A new clover sod is sometimes used with good result and when properly manured is a very good foundation for a crop of tobacco. Of

THE MANURES in use for tobacco, common barnyard or stable manure is preferable, to any other. Horse manure is considered the *best*, as it is supposed to produce a better quality of leaf than that made from cattle, but any kind of barnyard manure, if well rotted, will give good results. These manures may be applied at any season when the ground is not occupied with the crop; but it is customary to apply it immediately after the crop has been removed, as it will then have opportunity to decay and the elements will become incorporated in the soil. Green manures are not suited to the wants of the tobacco plant. They produce neither large yield nor good quality. Commercial fertilizers are not in favor among Chemung tobacco growers, though they are occasionally used when other manures cannot be procured. They are at best considered poor substitutes for barnyard manure, and on our rich, heavy soil, frequent trials have failed to prove their utility in increasing the growth of the plant; besides, their use is thought to injure the burning qualities of the leaf.

THE TOBACCO BED.—It is my aim in these articles to give plain directions for growing and handling a crop of tobacco from beginning to end, by which farmers not experienced in this line of farming, may be guided. Each process will be described as nearly as possible in the order in which it occurs.

A good tobacco bed, surrounded with a frame slanting towards the south or east and fitted for a covering of glass, is considered indispensable in growing early plants. While these do not always yield the best tobacco, it is important, with the farmer who anticipates growing a considerable quantity of tobacco, to have some early plants. A succession of settings is desirable inasmuch as it gives the grower more time to perform the various steps in their season and to do them well than if the entire crop required attention at once. For this reason we herb growers aim to have some early plants, some medium early, and some late, which provides for the desired succession of settings. The early plants are grown under glass and the late ones without the use of that covering. The bed should be prepared the Summer previous to the Spring when it is needed for use, and frequently forked over during the Summer and Autumn to give the weed seeds a chance to germinate and be destroyed. In making new beds it is best to draw a few loads of very rich soil or muck form some rich spot, and apply it to the bed. When the bed is completed, if not already rich enough, let a liberal coating of well rotted barnyard manure be applied. This manure not only adds fertility to the bed, but it has a valuable mechanical effect in the soil, rendering it loose and friable, so that it will more perfectly hold an even moisture, which is essential for the quick germination of seed and growth of the young plants. In the Fall before the ground freezes up, let the surface soil be thrown up into a ridge, extending

SHOWING ESCUTCHEON OF JERSEY BULL-CALF, GRAND MIRROR, 4,904
From a Photograph.—Fig. 147.—See Page 171.

lengthwise through the bed, that the soil may be more perfectly pulverized by the action of the frost. In this shape it will also dry off quickly in the Spring, so that it may be worked. A warm, sheltered exposure should be chosen as a place for making the bed, as on the south or east side of some outbuilding or tight board fence.

SOWING THE SEED AND EARLY CARE OF PLANTS.—Early in the Spring—if early plants are desired—the glass should be placed over the bed, so that it may all the sooner become in condition to "work." If plants large enough to set are desired before June 10, in this latitude the seed should be started or "put to sprout" by the 5th of April. In order to save time and labor, it is customary to sprout the seed before sowing it. This is done by mixing it with very fine muck or leaf mold, from four to six days previous to the time for sowing it, and placing it in a pan by the fire until sprouted. Great care should be taken to keep the mixture moist and warm, or the seed will not germinate. A woolen cloth should be kept over the mixture, which should be saturated occasionally with warm water to prevent the seed from drying up.

One-third of a pint of seed will give 200 square feet of bed which will with good success furnish plants enough to set three acres. While the seed is sprouting the soil in the seed-bed is prepared to receive it, by being made mellow and fine by the use of the fork and rake. When sprouted, the seed is sown evenly over the bed, and carefully raked in with a fine-toothed even rake. The seed must not be covered deep, or it will not grow. Indeed, many do not cover it at all, but simply sow it on the surface. When the seed is sowed, the soil should be well "firmed" down with a roller or wide board, after which the bed is sprinkled with tepid water.

During the first few weeks after sowing the seed, the tobacco bed will require almost constant attention. The young plants are exceedingly tender and great care must be exercised to keep the surface of the bed from becoming dry. Tepid water is used to water the bed in order to hasten the growth of the plants, and it should be applied with a sprinkler having a fine rose, otherwise the seed will be washed out and destroyed. Until the leaves of the young plants are as large as a silver half dime the growth is very slow, and about one-half of the time of the growth of the plants while in the seed-bed is consumed while they are attaining this size. After plants have started their second pair of leaves, they may be further forced by stimulating their growth with liquid manure. This is best made and applied by placing in the barrel containing water for sprinkling the bed, a sack of hen manure or guano. On very warm days, the sash should be raised to prevent the plants from burning, and on cool nights, when there is danger of a frost, the bed should be protected with a covering of old carpets or boards.

PEACHBLOWS NOT "RUNNING OUT."—There is a gentleman in this country who has grown Peachblow potatoes continuously since their general introduction, many years ago. He has never changed seed, always planting his own, using the small ones. His soil is clay; he has always fertilized with barnyard manure. He has been raising better crops of late years than formerly. It would be difficult to convince him that potatoes "run out," even when small ones are planted, year after year. This is not thought to be an "Irish potato" country—Northern seed is usually planted.

Easton, Talbot Co., Md. H. S.

Scientific and Useful.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN NO. 52, FEB. 2, 1881.

Cost of Active Ingredients of Fertilizers During 1880 and Trade-Value Adopted by the Station for 1881.

Organic nitrogen has cost in the manipulated fertilizers, viz: Superphosphates and special manures, on the average, more than the amount allowed in the valuations, *i. e.*, 20 cents per pound. In dry fish scrap the cost has been 18 cents. In the samples of low-grade dried blood and tankings analyzed by the Station, nitrogen has cost 16 cents and in castor pomace and cotton-seed meal it has also cost 16 cents. The nitrogen of fine bone has been bought for 15 cents. The ruling market price of nitrogen in the highest grade of dried blood has been, during the Spring until Midsummer, about 15 cents. In the Autumn, as usual, the price advanced because of active demand among the manufacturers of superphosphates, etc., and reached 18 cents per pound.

It is plain that there is a considerable and permanent difference between the trade-value, or cost to the farmer, of organic nitrogen in the superphosphates and other manipulated fertilizers, and that of the raw materials ordinarily accessible to the retail purchaser. To adapt our system of valuation more perfectly to this state of things, I shall continue to rate organic nitrogen in superphosphates and special manures and in fine steamed bone, finely-ground and dry meat, blood and fish, and in Peruvian guano at 20 cents. In view of the market prices that have ruled for two years, I shall rate together the nitrogen of coarse or moist meat, blood, tankage, castor pomace and cotton-seed meal at 16 cents. The trade-values of nitrogen in the various grades of bone will also be reduced to conform to their actual cost.

Nitrogen in the Form of Ammonia-Salts and Nitrates.—Ammonia-salts do not appear in our retail market except as ingredients of some manipulated fertilizers, and the Station valuation for their nitrogen will remain as formerly. Nitrates in the single sample of nitrate of soda analyzed has furnished nitrogen at 28 cents, but since probably the price will fluctuate, no change in its trade-value appears to be called for.

Soluble phosphoric acid has been procurable in 1880, as in 1879, at a cost of 10 to 11 cents per pound in the imported superphosphate.

In our home-made manipulated fertilizers it still costs 12½ cents, and that may therefore remain as the Station valuation

Reverted phosphoric acid in the various manipulated fertilizers has cost no less than formerly, and the former price, nine cents, is retained.

Insoluble phosphoric acid in dry fish and in the different grades of bone has cost one cent per pound less than last year's valuation.

Potash, in nearly pure, high-grade sulphate, is reckoned at seven cents, and in muriate at three and one-half cents per pound. In low-grade sulphates containing magnesium chloride, and in kainite, it would probably be fair to reckon potash at five and one-half cents.

For comparison of the average trade-values employed in 1880 with those it is proposed to use for estimating the commercial value of fertilizers in 1881, see the following statement:—

	Average Trade-value for 1879 and 1880. Cents per pound.	For 1881. Cents per pound.
Nitrogen in nitrates	23	26
" in Ammonia-salts	23½	25½
" in Peruvian Guano, fine steamed bone, dried and fine ground blood, meat and fish, superphosphates and special manures	20	20
" in coarse or moist blood, tankage, castor pomace, cotton-seed, linseed and in fine ground bone, horn and wool dust	20	16
" in fine medium bone	18	15
" in medium bone	17½	14
" in coarse medium bone	16½	13
" in coarse bone, horn shavings, hair and fish scrap	15	12
Phosphoric acid soluble in water	12½	11
" "reverted" and insoluble, in Peruvian Guano	9	12½
" " in fine bone and fish guano	9	9
" " in fine medium bone	7	6
" " in medium bone	6½	5½
" " in coarse bone, horn shavings, hair and fish scrap	6	5
" " in coarse medium bone	5½	4½
" " in coarse bone, bone ash and bone black	5	4
" " in fine ground rock phosphate	3½	3½
Potash in high grade sulphate	7	7
" in low-grade sulphate and kainite	5½	5½
" in muriate or potassium chloride	6	3½

The reasons for these changes are to be found in the Bulletins of the Station for 1880 and in the Report for 1880, now nearly printed.

Fertilizer Analyses.

494. Lime-kiln ashes from New York State.

507. Lime-kiln ashes from stock of Ralph Barber, Rockville. Sampled and sent by H. A. Slater, North Manchester.

	491.	507.
Sand and insoluble	10.23	2.75
Silica		1.33
Char		4.98
Oxide of iron and Alumina	3.73	.22
Lime	50.53	53.87
Magnesia	3.19	1.30
Potash	1.74	1.94
Soda	.55	.73
Phosphoric acid	.63	1.31
Carbonic acid	29.40	24 81
Water at 212°		2 15
Combined water and loss		4.64
Nitrogen	none	none
	100.00	100 00
Estimated value	?	?
Cost per bushel	?	20 cts

Sample 491 was analyzed for private use, and the Station has no information as to cost, etc.

Both 491 and 507 have a composition more nearly like that of leached ashes than anything of common occurrence with which they can be compared. From leached ashes they differ in containing little or no moisture and about 20 per cent. more lime. They agree in general with leached ashes in the proportion of alkalies, magnesia and phosphoric acid present, although their potash is more and their phosphoric acid less than leached ashes commonly contain. Of the lime in sample 507, about 31 per cent. exists as carbonate and about 21 per cent. as caustic lime. These ashes are, in fact, wood ashes mixed with four or five times their weight of lime. They must be used with caution, but, if properly applied, will no doubt prove a valuable fertilizer on some soils. As to their money value, that is not easy to estimate with accuracy. Doubtless, however, they are well worth 20 cents per bushel if equal to the sample.

Baker's Special Manures.

517. Tobacco manure.
518. Potato manure.
519. Onion manure.
520. Turnip manure.
521. Oat manure.
523. Wheat manure.
523. Cabbage manure.

The above seven samples were manufactured by H. J. Baker & Bro., of New York, and sampled from his stock by S. C. Hardin, Glastonbury, Dec. 15, 1880.

	Tobacco. 517	Potatoes. 518	Onions. 519	Turnips. 520	Oats. 521	Wheat. 522	Cabbage. 523
Nitrogen as ammonia	4.01	2.77	4 08	5.47	3.66	4.86	4.35

Dairy Husbandry.

THE DAIRY COW—NO. 27.

HENRY STEWART

Rennet.

RENNET is the agent commonly used in the preparation of the curd in cheese-making. Recent discoveries in regard to acidification, so-called oxidation and fermentation, have thrown much light upon the character and modes of action of rennet. It is now well known that all these changes in liquid substances which contain sugar or organic matter in solution are produced by a process of vegetation of certain germs or spores and the production of organisms of which the yeast plant is a type. It is also well known that a very small quantity of a liquid, or even of its dried substance, added to such a solution is able to communicate the vegetative action which at a certain temperature, in a very short time, diffuses itself throughout the whole. And this is precisely the action of rennet upon milk. The very interesting question then occurs, what is rennet and upon what does its action depend? The rennet commonly used is a solution of the calf's stomach. An equally effective rennet may be made by infusing in water the intestines of a calf, the stomach or intestines of a young lamb or of a sucking pig, or even the bladder of an animal. It has been supposed that the gastric fluid of the calf's stomach was the coagulating agent of the rennet, but this supposition is without foundation and may be so shown by the well known fact that a stomach may be steeped in water several times, resulted after each infusion and in course of time it will recover its peculiar power of coagulating milk. So also sour milk and the sweet curd itself possess this coagulating power. Further, an extract from malt known as diastase has the property of changing starch into sugar, but if this diastase be exposed to the air for a time it undergoes a change similar to that which occurs in animal membranes and acquires the property of changing into lactic acid and coagulating milk. We are then forced to believe that it is not the acid contained in the rennet or any property derived from the gastric juice that confers this power upon it, but the presence of a peculiar organism which has the ability to reproduce itself in a favorable vehicle such as milk.

DRYING RENNET. FIG 148.

With this knowledge, the use of rennet as a coagulating agent in cheese making becomes easily understood and its preparation free from difficulty. The calf's stomach will always be the most popular substance used for this purpose in cheese making and its preparation may well be considered particularly. The stomach of the newly killed sucking calf only is used. This contains some of the curd of the milk upon which it has been fed and in some dairy districts the calf is given a copious drink of milk shortly before it is killed, so that the stomach may contain a larger quantity of this curd, which is preserved with the stomach. The stomach either emptied of its contents, or with these intact, is salted inside and out and dried in a warm place. The usual method is to turn the stomach, shake off the curd, salt the stomach, return it and salt the outer side, then stretch it upon an elastic twig and hang it up to dry (see Fig. 148). When the rennets are perfectly dry they may be put into a bag and hung up in the dairy room for preservation. Other methods are used in different localities, such as to pickle the stomachs in brine and dry them, or to pack them in jars or barrels in salt and keep them until required for use. In Italy and Switzerland the stomachs are chopped up very fine, mixed with salt, pepper, bread crumbs and whey into a paste which is pressed into jars or bladders and kept for use. The rennet improves with age and is the strongest when 10 or 12 months old. New rennet is charged with producing heading, swelling or "huffing" of the cheese. This peculiarity strongly corroborates the view above taken as to the nature of the action of rennet, for time is necessary to produce most effectively the organic change which takes place in the membrane and upon which its action depends.

Rennet is used in a liquid form, because it can then be quickly and intimately mingled with the milk. From what has been said of its character it will be evident that every particle of it must be a center of action and that this action spreads from each center in precisely the same manner in which the mycelium of a mold or fungoid growth spreads in every direction from every spore until the whole mass in which it is placed is quickly impregnated. For its proper action, then, it must be thoroughly stirred into the milk which is brought to a certain temperature, lower or higher according to circumstances for the reason that the germinative action is hastened by a proper degree of warmth. Usually the dried stomach is infused in warm water or whey and some dairymen add the juice of lemons to the infusion, one quart of the liquid being used for each stomach. Half a pint of the infusion to 100 gallons of milk is generally sufficient to bring the curd in one hour, with the milk at a temperature of about 80 degrees. The procuring of the curd is one of the most important manipulations in making cheese, as the quality of the product and its ripening or curing depend very much upon this part of the process being carried out with great carefulness and skill. The flavor of the cheese may be seriously affected by bad and impure rennet, and if putrefactive germs are contained in it, the decomposing ferment will assuredly be communicated to the cheese with disastrous effect. Doubtless many of the inexplicable troubles of the dairyman arise from the use of ill-conditioned rennet, and this should be carefully guarded against. It is always a safe precaution, when doubt exists as to the purity of the rennet, to filter it through flannel or even through cotton fiber, or blotting paper. By varying the character of the rennet the character of the cheese may be changed, and where many varieties of fancy cheese are made the rennet used differs very much. Some very celebrated French cheeses are made of rennet prepared with water to which brandy is added in the proportion of one-third, and spices and aromatic herbs are steeped with the stomachs in this mixture. For other cheeses pig's bladder is steeped in white wine and vinegar, and others again are made with diluted acids only.

The exhausted stomachs need not be thrown away, but may be again salted and left to renew their strength. This they will do in the course of some months, and as yet, no one has been able to say when this power of recovering their activity will be entirely lost. If this activity depends upon, or belongs to, the membrane, as almost conclusively appears, it may last until the membrane itself is dissolved away.

NOTE.—In the "Dairy Cow" No. 26, page 130, issue of February 26, a typographical slip occurs in the eleventh line from the bottom of the first column. After the word "solution," the correct reading would have been:—But it is easily soluble in a weak solution of carbonate of soda or potash.

The Herdsman.

THE GUENON MILK-MIRROR.

(See Illustration on first page.

THE name of the simple Bordeaux peasant, is, and should be, permanently associated with his discovery that the milking qualities of cows were, to a considerable extent, indicated by certain external marks easily observed. We had long known that capacious udders and large milk veins, combined with good digestive capacity and a general preponderance of the alimentary over the locomotive system, were indications that rarely misled in regard to the ability of a cow to give much milk; but to judge of the amount of milk a cow would yield, and the length of time she would hold out in her flow, two or three years before she could be called a cow—this was Guenon's great accomplishment, and the one for which he was awarded a gold medal by the Agricultural Society of his native district. This was the first of many honors with which he was rewarded, and it is much to say that no committee of agriculturists who have ever investigated the merits of the system have ever spoken disparagingly of it. Those who most closely study it, especially following Guenou's original system, which has never been essentially improved upon, are most positive in regard to its truth, and enthusiastic in regard to its value.

The fine, soft hair upon the hinder part of a cow's udder for the most part turns upward. This upward-growing hair extends in most cases all over that part of the udder visible between the hind legs, but is occasionally marked by spots or mere lines, usually slender ovals, in which the hair grows down. This tendency of the hair to grow upward is not confined to the udder proper; but extends out upon the thighs and upward to the tail. The edges of this space over which the hair turns up are usually distinctly marked, and, as a rule, the larger the area of this space, which is called the "mirror" or "escutcheon," the more milk the cow will give, and the longer she will continue in milk.

That portion of the escutcheon which covers the udder and extends out on the inside of each thigh, has been designated as the udder or mammary mirror; that which runs upward towards the setting on of the tail, the rising or placental mirror The mammary mirror is of the greater value, yet the rising mirror is not to be disregarded. It is regarded of especial moment that the mirror, taken as a whole, be symmetrical, and especially that the mammary mirror be so; yet it often occurs that it is far otherwise, its outline being often very fantastical—exhibiting deep *bays*, so to speak, and islands of downward growing hair. There are also certain "ovals," never very large, yet distinct, which do not detract from the estimated value of an escutcheon; notably those occurring on the lobes of the udder just above the hind teats. These are supposed to be points of value, though for what reason it would be hard to tell, yet they do occur upon some of the very best milch cows, and those whose mirrors correspond most closely to their performances.

Mr. Guenon's discovery enables breeders to determine which of their calves are most promising, and in purchasing young stock it affords indications which rarely fail as to their comparative milk yield. These indications occasionally prove utterly fallacious, and Mr. Guenon gives rules for determining this class, which he calls "bastards," without waiting for them to fail in their milk. The signs are, however, rarely so distinct that one would be willing to sell a 20-quart cow, whose yield confirmed the prediction of her mirror at first calving, because of the possibility of her going dry in two months or so, as indicated by her bastardy marks.

It is an interesting fact that the mirrors of bulls (which are much like those of cows, but less extensive in every direction,) are reflected in their daughters. This gives rise to the dangerous custom of breeding for mirrors, rather than for milk. What the results may be after a few years it is easy to see. The mirror, being valued for its own sake—that is, because it sells the heifers—will be likely to lose its practical significance and value as a *milk* mirror.

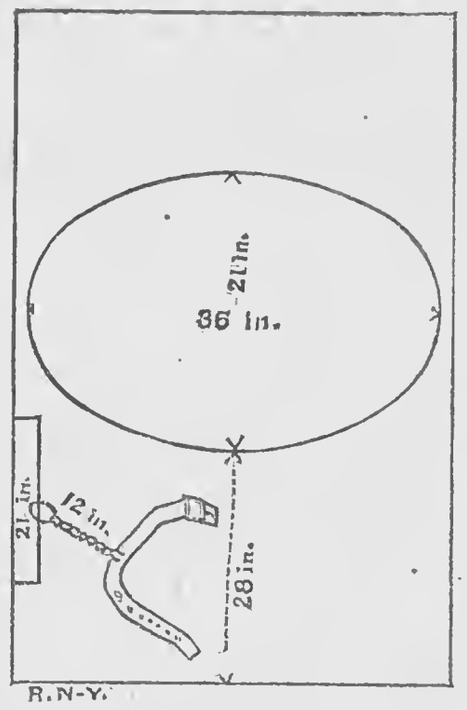
We have a striking photograph of a young Jersey bull, the property of Mr. John L. Hopkins, of Atlanta, Ga., and called "Grand Mirror." This we have caused to be engraved and the mirror is clearly shown. A larger mirror is rarely seen upon a bull. We hope in a future number to exhibit some cows' mirrors of different forms and degrees of excellence.

TO KEEP A COW CLEAN.

RICHARD GOODMAN, JR.

WE are beginning to recognize, slowly but, nevertheless, surely, that to make the best butter we must, among other things, keep the cow clean. Not clean inside only; though this is no unimportant or easy task, for it requires that the hay be not musty, that the grain be not soured, that the roots be not rotted, and it requires that the water be uncontaminated, and the atmosphere of the stable free from the odors of dung and urine and all decaying matter. Not clean inside only but clean outside also. Clean skin as well as clean hair, clean udder and clean switch.

How shall we keep cows clean outside as well as inside, and keep them thus with comfort to themselves and with profit to ourselves?



COW FASTENING.—FIG. 149.

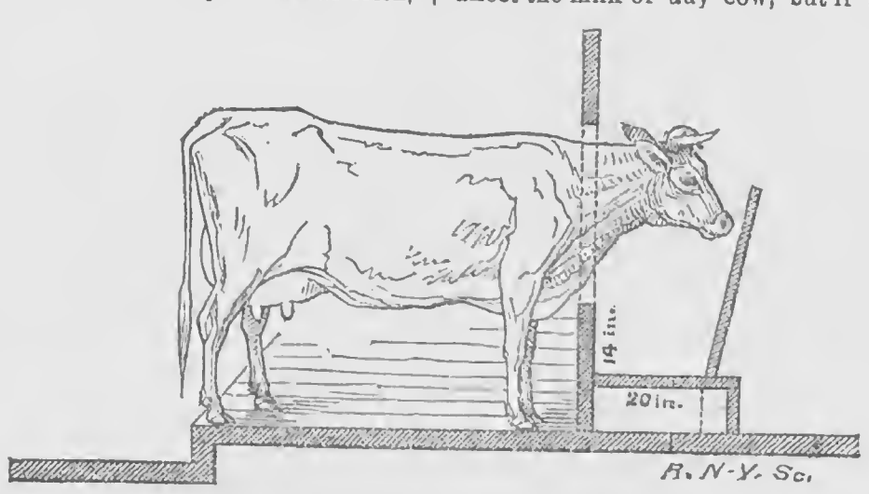
I know of one way only, and this I will attempt to describe. In the first place, let the platform be as short as it is possible for the cow to stand on with comfort, and let it be raised three or four inches higher than the passage-way behind her. Put a strap or chain around the cow's neck. Connect this neck-strap by a piece of chain 12 inches long to a ring which is free to run up and down an iron rod 20 inches long and secured perpendicularly at the left of the cow, Fig. 149. Let the cow reach the food in her manger by putting her head through an oval opening which shall be 20 inches from top to bottom and 36 inches from right to left, and let the lowest point of the bottom of this opening be 28 inches from the platform which the cow stands on. Let the bottom of the manger be about a foot from the level of the platform and about three feet wide and 20 inches broad.

This form of cow-stall (which may be frequently met with, but which I have never seen except in our own stables) seems to keep the cow secure, comfortable and clean. The 12 inches of chain which connects the neck-strap with the 20-inch perpendicular rod give the cow ample room to lie down, to get up and to reach the food in all parts of her manger; it does not cramp the cow when lying down, rising up or reaching for food in the corner of the manger, as do all forms of stanchions. The oval collar in front of the manger prevents the cow from stepping into it (as is frequently the case with unprotected mangers and cows tied by the neck-strap) and, while thus advanced on the platform, dunging upon that part of it where they will soon rest their flanks and hag when lying down. The elevation of three or four inches above the passage-way allows the dung and urine to fall entirely off of the platform.

Now cover the platform and passage-way with a thin coating of powdered gypsum, and then two inches of dry sawdust—and unless you have cows more "fidgety" than any I have ever encountered, you may expect to find them, morning, noon and evening, clean and always comfortable. Of course the sawdust and plaster should be renewed once or twice in the twenty-four hours, the accumulations of dung shoveled away at least as often, and the whole cow carded and brushed once a day.

Of all the forms of cow fastenings, other than this which I am describing, the stanchion is the cleanest and cheapest and most convenient, but it is open to the objection of being too severe and rigid for heavy or sickly or stiff-jointed cattle. The box stall conduces to the animal's comfort certainly, but is expensive and not always cleanly, for many cows seem to take pains to lie down in their freshly dropped dung, possibly because of its warmth. The neck-strap with running ring and open manger is comfortable but not cleanly, for the cow is very apt to place her front feet in the manger and while in that position dung upon the platform.

The measurements given above apply to stalls for Jersey cows; they should be varied of course according to the general size of the breed; but for all kinds of cows these stalls will be found, I believe, cleanly and comfortable for the animals and convenient and not expensive for the owners.



HOW TO KEEP A COW CLEAN.—FIG. 150.

STOCK NOTES.

A MOST serious calamity has befallen not only the owners but the breeders of Jersey cattle generally, in the loss by fire of 51 head of that breed which were burned in the barns of the "Elizabeth Farm" of the Coleman estate at Brickerville, Penn. This estate, under the management of its efficient agent, Mr. Cameron, had got together a very choice selection of animals of various breedings and valuable strains of blood which had already had their merits tested and appreciated at the prominent cattle exhibitions, and but for this fatal calamity would have made their mark throughout the country in their offspring. Among these animals were a bull and twelve young cows from the choicest of the Yokun Farm herd of Mr. Goodman of Lenox, Mass.

THE breeders on the Island of Jersey have had another pricking of the ears lately by the purchase of three of the best cows at the reputed price of $1,000 each. Some of our young "bloods" with inherited wealth, are as lavish on cows as Mr. Vanderbilt is on horses and pictures, and generally they find their money well invested. The best returns have come from these apparently excessive expenditures, and if to-day one Jersey bull could be selected as *primus inter pares*, he could be bought at any price within reason, say $5,000 to $10,000, and money be made from him. But enterprise and judicious liberality are not confined to the wealthy breeders. Only a few years since an intelligent mechanic came from Jersey City to his native place in Curtisville, Mass., settled upon the old farm, bought a few of the best Jerseys, found it a profitable business, and moved to a larger farm near Westfield in the same State, where his business prospers.

AT Lenox Furnace, Berkshire Co., Mass., is the farm of a young and enterprising breeder, E. M. Washburn, who, inheriting a well cultivated property, has turned it into a Holstein breeding establishment, and his neat catalogue just issued, of seven bulls and thirty females, some of the latter weighing 1,000 to 1,400 pounds, shows how rapidly he has filled up his stables with superior animals. Mr. W. has not been content with having all the "modern conveniences," such as steam power for working, pumping water, cutting up feed and ensilage tanks, and then looking round to select his cows and bulls, but sent a competent man direct to Holland and imported his own cows and has made money by doing so. Mr. Washburn for many years past, has made a business of sending milk to New York, as most of the families along the Housatonic Valley have done, and he says he has never found any cows of any breed that would equal the average of his present herd of Holsteins in quantity or quality of milk or in the satisfactory condition in which the milk reaches the consumer. The Holsteins have the good quality of most high-bred cows of being docile in the stable and pasture, possessing a quiet nature, and this with proper feed has more effect upon the condition of the milk than most people imagine. Improper feeding, such as too much grain and over-stimulating food, will affect the milk of any cow, but if the latter, like so many half-breeds or natives, has also a vicious, unquiet disposition, her milk is affected and the consumers, especially if babies, soon show the effects.

NEW England and the Middle States (and the South and West soon will) have numbers of young, enterprising breeders who are not only buying the best cattle abroad, but breeding to a high pitch of perfection, and great as are the results already obtained, there is no reason why they will not be exceeded, and we shall have, if we do not possess already, the best animals of every breed to be found in the world. We once "cornered" the market on Short-horns of the Duchess family and can do it soon again in Jerseys, Holsteins and Ayrshires, as well as Durhams.

MR. SIMPSON and Mr. James Stillman, both of New York city, have recently entered the "Jersey" arena, and with plenty of money are stocking their farms with the choicest specimens they can select and purchase.

W. S. TAYLOR, Burlington, New Jersey, is refilling his stables, but it will be hard for him to duplicate "Favorite of the Elms." It has been said that the famous Jersey bull, *Sarpidon* supposed to be dead, has been found *inter vivos*, and is claimed as a *deodand* by several persons who would like to act as high priests.

THE American Jersey Cattle Club has extended its rules regulating the importation of animals from the Island of Jersey, so that they did not go into effect until March 1st.

MR. BURNHAM of Saugatuck, Connecticut, is reported as the purchaser of one or more of the high-priced cows lately sold on the Island of Jersey.

Industrial Implements.

A Thriving Firm.

On a recent visit to the old-established agricultural implement works of Messrs. Gregg & Co., Trumansburg, I found them overcrowded with business. They have added many new machines to their line of manufacture during the past season, and as their goods are well known for superior workmanship, they have already made a first-class reputation and are meeting with large sales. Their Meadow King Mower has been made and sold by them for the past fourteen years, and it stands in the front rank of implements of this class and is well known throughout this country. Messrs. Gregg & Co. were the pioneers in the plow sulky line, having brought out the Osborne Plow Sulky in 1870. Its sale has steadily increased from year to year, while this year it promises to double that of any former one. This firm have been testing a new light reaper, of which they will bring out a limited number this season. It will be known as the Gregg Reaper. They cut with one of them last year over 700 acres of wheat, oats, buckwheat and barley, moving the machine over 70 miles in doing it. It stood the test well. If it does as well this season, Messrs. Gregg & Co. will build a large number of them for the season of 1882. Their orders for King of the Lawn and Young America Lawn Mowers show a large increase over previous years. W. H. K.

The Watertown Wagon Co.

THE flattering success which the Watertown wagons have met with since their first introduction has induced the Watertown Spring Wagon Co. to add to their line of manufacture several styles of three-spring wagons and one with an elliptic spring in front and platform springs in rear, and with reach. These wagons will be made in the excellent style which has secured for this company its high reputation and extensive sales. Last year they were compelled to enlarge their works and this year they will have to build another addition to meet the wants of their large increase in business. In order to facilitate their Western shipments they have established warerooms, with Messrs. A. A. Abbott & Co. as managers, at 298 & 300 Wabash Avenue, Chicago, Ill. The Watertown Wagon Co. have good reasons for the extraordinary success in their business, as they keep up the standard of their work, use nothing but first-class material and employ none but skilled workmen, and all their wagons and buggies are first-class and come fully up to representation. K.

GOOD TOOLS.—When a farmer or gardener is about to invest in a tool costing several dollars, he takes pains to post himself as to the different brands, and tries to get the best. Yet the small tools, and many of them such as are used every day the year round, are bought without much regard as to who made them or as to their quality. This is especially true of such a tool, say, as a pocket knife. When a pocket-knife is needed the stock of the country store is examined and one selected because it seems to be good. But we have all found out to our sorrow that knives are rarely made to *cut* now-a-days, but are, like the man's razors, made to *sell* We know of no tool that needs to be more reliable than the pocket-knife, for most of the time it is the only one at hand to help one out of a difficulty, and we are glad in this connection to call attention to the advertisement of Maher & Grosh in another column who advertise "knives to cut," and to assure our readers they will do just what they promise to do. B.

Miscellaneous.

RURALISMS.

THAT eminently good man, Mr. Peter Cooper, has just celebrated his ninetieth birth-day. There is no man in New York so sincerely loved and respected as he is for his beneficent acts, the benefits of which are enjoyed by all classes of the community. The Cooper Union is a grand monument, and he needs no other; but it has occurred to me that horticulture might do something in recognition of philanthropy such as his, which the children of horticulturists can enjoy in common with others; besides, it is known to me that Mr. Cooper has been a patron of horticulture in his peculiarly quiet way. I should like to see some *good* plant, a fruit or a flower, named after him; and I should further like to see a graceful act on the part of the Central Park Commissioners, to the effect that Mr. Cooper be invited to plant a tree in a suitable place on one of the Central Park lawns, to be known as the "Peter Cooper Tree."

A DAILY evening paper recently stated that Col Wilder, forty years ago, imported the first camellia plant, for which he paid $250, and that from that plant all the plants in the United States have been grown! Mr. Wilder always has a pleasant smile on his face, and it may be that statements such as these have something to do with it. I think he was raising seedlings of his own as early as that. I venture to say that forty years ago Mr. Wilder had more than forty varieties of the camellia, and that there were more than forty thousand plants in the United States forty years ago, if the reader will forgive the alliteration. It would not surprise me if it were found that there were more camellias grown at that time than there are to day. For some years past the pure and simple beauty of the camellia has been quite overshadowed by flowers of a gayer hue. The camellia is no longer a fashionable flower. So much the worse for fashion.

THE toad is so highly prized in France as a destroyer of slugs and other vermin, that a Frenchman has thought to add to its valuable qualities by crossing it with the frog, and says he has succeeded, and is well satisfied with the result. I am convinced that we do not sufficiently value the toad as an aid to horticulture. He is peculiarly the gardener's friend, and a goodly family of toads should find a place in every garden, and the children be taught not to harm them. They are useful in the greenhouse; and I always put toads and land turtles in the grapery. The tortoise is amusing as well as useful, and is capable of forming a friendship for you, if you will encourage him a little. I have taught him not only to eat out of my hand, but to stand on his hind legs to receive food. He will sometimes, however, mistake one's finger for a worm, and hold on like a crab.

THE fearful storm that passed over the country lately has its lessons for the fruit grower as well as for others. The destruction of fruit and ornamental trees has been something to remember in this section. There is one fact to which I wish to call the attention of the fruit grower. I have noticed that the damage, in most cases, has been to close or full-headed apple trees. In almost every case in which the tree was broken short off, a foot or so from the ground, it was not only full-headed, but had the appearance of never having been pruned at all. A gale like this may not occur again in twenty years, but we all know that winds sufficiently strong to damage apple trees are by no means of infrequent occurrence. There can be no doubt that much of this damage might be prevented if the trees were properly pruned, so as to leave them with an open head. It is better for the tree, and, in my experience, very much better for the fruit. This pruning should be begun when the trees are young, and no apple tree should ever be allowed to fill up at any time with branches so large that they cannot be removed with a pruning knife. It is never too late, however, to remedy this neglect, and orchardists should not let another year pass without opening the heads of their apple trees, especially those who live in localities subject to strong winds. The pear is tougher and better able to take care of itself; yet many pear trees would be benefited by the same treatment.

I KNOW, of course, that ribbon border and carpet gardening have been on the increase with us for a few years past; but I did not know till recently that this thing had gone so far that gentlemen now send their gardeners to Europe to obtain the latest patterns and styles, very much as a modiste sends for the latest styles in dress. Two such cases have come to my knowledge; how many more there may be I know not. I do not know when I have heard of anything so thoroughly childish and absurd, and so well calculated to degrade gardening, and stamp out everything pertaining to originality and good taste. Perhaps the best comment is no comment at all.

I REGRET very much to learn of the death of Dr. C. W. Grant, to whom I alluded a short time since in this column. In the great revival and spread of grape culture some twenty years ago, he was a very prominent figure, and will find his proper place when the history of grape culture in this country comes to be written. He had some weak and a good many strong points, and will be remembered kindly by many friends. His large and select library was about equally envied and admired by horticulturists of literary tastes. Some notice seems to be due to a man who once occupied so prominent a place in the horticultural world, and I could not let his death pass without, at least, these few words.

HORTICOLA.

BOOKS RECEIVED.

ILLUSTRATED STOCK-DOCTOR AND LIVE STOCK ENCYCLOPEDIA BY J. R. MANNING, M. D. V. S. This work of 1,002 pages, octavo, is divided into ten parts:—Part I—166 pages—treats of the horse, his history, breeds, characteristics and management. Part II—264 pages—treats of his diseases, their causes, how to know and cure them. Part III, containing 102 pages, is devoted to the history, origin and breeds of cattle, and their management and cure. Part IV—54 pages—treats of the diseases of cattle; their causes, how to know them, and what to do in each case. Part V—32 pages—is devoted to the history, breeds, characteristics and management of sheep. Part VI—18 pages—treats of the diseases of sheep, how to know and cure them. Part VII—34 pages—treats of the history, breeds, characteristics and management of swine. Part VIII, tells of their diseases and how to know and to cure them. The remaining two parts, occupying 79 pages of the text, treat of the history, breeds, characteristics, breeding and management of poultry, and of their diseases, and the remedies therefor.

An appendix of 52 pages gives the history and record, etc., of the most famous English and American race horses and American trotters. The remainder of the bulky volume is occupied by a convenient glossary of scientific and other terms, with their definitions; after which comes a list of the numerous illustrations in the work, which ends with a copious index by means of which any subject treated of in any part of the volume can be readily referred to.

This volume is very useful to the farming community in that it contains a well-selected condensation of what has hitherto appeared in several works treating separately of the various matters herein grouped together. The book is mainly a compilation from other works, there being little original even in the multitude of engravings; but the information it contains has been carefully culled and skillfully arranged so as to present to the farmer much that has been ascertained both as to the history and characteristics of farm stock, as well as their best management in health or disease. The work is printed in large, legible type, and written so that all can readily understand it.

HORSES' TEETH. This is a treatise on the mode of development of horses' teeth, their physiological relations, anatomy, microscopical character, pathology and dentistry, based on the works of well-known odontologists and veterinary surgeons to which is added a vocabulary of the medical and technical words used. This work is chiefly a compilation of what has been said by others on the subject, the author Wm. H. Clarke, candidly confessing that he understands neither veterinary nor human surgery. The compilation, however, is made from the best authorities. Published by the author; price $1.50, cloth-bound, 265 pages, octavo.

RURAL BRIEFLETS.

AMONG novelties now offered for the first time is the "Perfect Gem Squash," one of which was sent to us by the introducers, J. M. Thorburn & Co., for trial. It was pronounced by those who ate it of remarkable sweetness and fineness of texture. The "Perfect Gem" is rather small, being about four or five inches in diameter, but it more than makes up in productiveness what it lacks in size. We were shown the squashes on the vine last Fall, and it occurred to us that we had never before seen so many growing upon one vine in so small a space. . . .

YEARS AGO we tested a variegated-leaved potato—the Early Rose, if we remember correctly. Now there is a variegated-leaved tomato—the Trophy. But variegated-leaved vegetables are "go-betweens." They are neither pretty enough to be classed among useful ornamental plants, nor productive enough to be cultivated in the vegetable gardens. They are simply curious—and *one* plant is enough. . . . . .

WE have received from Dr. J. M. Bailey an "Essay upon Ensilage." Dr. Bailey is the author of the "Book of Ensilage"—that is to say, the "New Dispensation for Farmers." This pamphlet tells what a silo is, what ensilage is, and what are their advantages. Dr Bailey lives in Billerica, Mass, and is the proprietor of "Winning Farm." He is also the proprietor of a "Virginia Stock Farm," somewhere in Sussex County, Va—the town is not given. We have expressed ourselves rather freely as to this Dr. Bailey on previous occasions. As to the subject of ensilage, we confess we have suffered ourselves to be prejudiced against the system by the obtrusiveness and vanity of Dr. Bailey—its foremost advocate in this country. The pamphlet in question is an advertisement of himself and his book, the same as his book—the first edition, at least—was an advertisement of himself and his stock. . . . . .

THE SOJA BEAN, which we have before several times alluded to, is now offered in catalogues of 1881. We had intended to test it last season, but it was overlooked. Mr. Gregory thinks that, as it yields leaves very abundantly, it may prove of value for fodder purposes if cut when green. He says that, "baked with the common field beans, it will be found finer grained and richer flavored." For fodder purposes we should hardly think it could prove more valuable than many kinds of cow-peas. . . . . .

MR. W. A. SANDERS, of Sanders, Fresno Co., Cal., writes us that he recently visited the best raisin vineyards of Europe, and brought back with him to California over $1 200 worth of vines. Some varieties, he says—the Suliana, for instance—can be grown in a common water pail filled with earth. . . . . .

MR GEO. B. BOOMER, of the Boomer & Boschert Press Co., Syracuse, N. Y., informs us that since January 1 he has sold seven of their power presses to one firm, five to another, one to another and one to another, *all engaged in the manufacture of oleomargarine in New York City alone.* To this we will add four that were sold in Philadelphia for the same business. These presses cost $700 each, and are capable of pressing a ton at a pressing, four times a day. Surely there must be some oleo. on the market somewhere. . . . . .

OUR friend Mr. M. B. Prince, of North Carolina, writes us as follows:—"It is gratifying to see that the RURAL still keeps hammering away at the Government on the Agricultural Department appropriations, and it is to be hoped that all other papers which have not already done so will fall into line, backed by the farmers themselves. I would like to inquire (not in a spirit of fault-finding) how many copies of the Report of the Commissioner of Agriculture are there printed each year, and where do they go to? As near as I can learn, very few fall into the hands of farmers, except those of a political turn." . . . . . .

ON page 31 of Mr. Peter Henderson's catalogue, he states, under a pretty little engraving of the Edelweis (Leontopodium Alpinum) that "this is probably the first time that seed has been offered in this country." In this Mr. Henderson is mistaken. We remember to have seen it offered for sale in another American catalogue two years ago. The Edelweis is more interesting in romance than in fact. It is a little composite of the "everlasting" type with stems less than a foot high. The flowers are borne in heads of yellowish flowers underneath which is an involucre of white, woolly leaves that constitute its chief beauty. The leaves are also woolly or rather cottony and two or three inches long. It is found among the Alps and not abundantly even there, so that the presentation of a bouquet of these flowers to his lady-love is evidence of sincerity on the young fellow's part, since he must have endured some fatigue and exercised a deal of patience to procure it. This Edelweis is a hardy perennial and will grow in any light, well-drained soil. . . . . .

LIVINGSTON PERFECTION TOMATO is introduced by Mr. A. W. Livingston, the originator of the Acme and Paragon. It is said to be blood red in color, perfectly smooth, has very few seeds, is larger and earlier than the Acme, ripens evenly, is a good shipper and excellent for canning. . . . . .

WE are in receipt of a very strange-looking apple—if apple it may be called—from a subscriber in Michigan, who says it is from a seedling which was "the result of cross-fertilization." The fruit is about the size of a medium Baldwin, nearly round, somewhat ovate, with *neither basin* nor cavity. The color is a bright yellow shaded with a brilliant red. The flesh is very white, fine-grained with a mild sub-acid, delicious flavor. The leaves, as our friend describes them, are long, narrow, pendulous and finely serrated, of a light-green color with long, slender petioles. Its keeping qualities are evidently excellent. It has a rich aromatic perfume that from one apple may be perceived in any part of a room. We have written to our friend for further particulars, as we deem the apple or hybrid between pear and apple, as he thinks it is, worthy of notice, and we shall, after receiving them, present an illustration of the singular fruit. . . . . .

WE see in a number of catalogues that a new wheat called "Golden Grain" is offered. Some call it "Palestine Mammoth" wheat. The grain closely resembles "Black-bearded Centennial" in size, color and shape. High praise is bestowed upon its productiveness, hardiness stiffness of straw, etc. We have no right to cast any doubts upon its value except that we are unable to ascertain that anybody has fairly tested it. The color of the grain is as light as that of Clawson. It is short and so plump as to justify the claim made for it of being the largest grain in cultivation. We have the "Black-bearded Centennial" which it so nearly resembles, growing at the Farm and we shall sow the "Golden Grain" this Spring. . . .

RESPECTING the "Golden Grain" wheat we have just received the following note from a correspondent in Penn:

"I, this day, sent you by mail a sample of the Golden Grain, or Palestine Mammoth, Wheat which I think will exceed anything you have in New York State. If you have anything better I should be pleased to see a sample. The Golden Grain, or Palestine Mammoth Wheat, was brought from Palestine four years ago. It is a very hardy and most productive variety, with long, stiff straw. It stands well and stools heavily, growing from 25 to 70 stocks from a single grain. The ears are of good length, closely filled with full, plump grains with but little chaff, having yielded last year 32 bushels on one-half acre of land. The greatest curiosity about this wheat is that when it first shoots into heads it is a bearded wheat; but when it is ripe it is a smooth wheat."

GOOSEBERRIES when fairly ripe are to many a very eatable fruit—especially the sweet kinds. Years ago a native seedling bush was presented to us by Mr. A. S. Fuller, who was at the time an associate editor of this journal or rather of MOORE'S RURAL NEW-YORKER. This bush has borne an immense amount of berries every year since, and, though no larger than those of Downing, they are, for a gooseberry, tender and very sweet when fully ripe. There is not the same inducement for the horticulturist to work with seedling gooseberries as with the delicious grape and strawberry. It is essentially a coarser fruit. Nevertheless it is still, no doubt, capable of decided improvement. We want a productive, excellent gooseberry as large in size as the English kinds, that *will not mildew.* Very likely crosses between the foreign and native kinds might effect this. But we do not hear that any persistent work or study has been given in this direction. .

FOR mildew upon gooseberries no better remedy is suggested than partial shade, mulching and flour of sulphur, dusted freely over the leaves. . . . . .

MR. MERCERON of the Pennsylvania Fruit Growers' Society, says that the Sharpless, from all reports, is the best variety from Maine to California. He says it roots deeply into the soil, and therefore holds its foliage better than other varieties. The original plant which grew in 1872 is still alive. Mr. Sharpless is not positive what it is a seedling of, as he had Wilson, Downing and Jucunda all around it. .

MR. MEEHAN thinks that robins, sparrows, etc., are not an evil, for though they destroy our fruit, there are months that we have no fruit, during which time they destroy a great number of insects. . . . . .

IT is almost as important to prune the currant as to prune the grape. Cut out all old, blackened stems. . . . . .

THE Herald says that when a New-Yorker wishes to boast that his family has lived here for a long while he says: "My grandmother used to pick blackberries where Canal Street now is." . . . . . .

LONG ISLAND farmers are rejoicing over the extremely cold weather, thinking that the Army Worm and the potato bugs will be destroyed. .

A CORRESPONDENT from Long Island states that he bought a pair of Poland China pigs in November for $7.00, and at the same time a pair of common ones for $5 00. February 1st the Poland Chinas, he says, are about two-thirds heavier, though all have had the same chance.

What Others Say.

REGARDING the culture of sorghum and its manufacture into sirup and sugar, we find some interesting matter in the reports of the late meeting of the Minnesota Sugar-cane Growers:

Mr. Wilcox, of Wisconsin, said: Sandy loam in new land will, if planted early, secure a good crop. Barnyard manure and plaster-of-Paris fertilizing will aid old land in producing an early growth and a large-sized cane. The percentage of juice is greater in a large-sized cane than in a small-sized one. A sub-soil of clay retentive of water is injurious to the cane. Soak the seed in warm water, plant early, and cultivate carefully on the first appearance of weeds. Careful cultivation is a necessity. This industry has ceased to be an experiment. Nothing has yet been found to supersede the vacuum-pan for finishing, but it is too small for any but small manufactories.

Mr. Porter would decidedly sucker the cane. Mr. Nash planted his cane with a stalk every

10 or 12 inches, and had no suckers and the cane was large. On one acre he had 160 gallons—another planted 3½ feet apart, and had 80 gallons.

Mr. Hampton, of Hastings, had 140 gallons from one-half acre, and 16 bushels of nice seed; this year but 84 gallons, on account of suckers.

The President in his address said:—"We are making progress. The work of refinery has told us that there is as rich a mine of wealth in Minnesota as in any State in the Union. Our business is to help develop that wealth. As long as so much sugar and glucose are sent here I think our chances are good. I wish to speak of the average yield in gallons for 1879, which was less than 89 gallons per acre. This is but a small per cent. of the product saved. I bought and weighed at my sugar works in Morristown 973 acres of cane. It averaged 10 tons per acre and 14 gallons per ton. I also worked about 20 acres from which I did not strip the leaves, as it was getting late in the season and the leaves were in fine condition. This cane was cut, most of it, from September 15 to 18, and piled in the field, where it lay until I used it; it had dried out some. I estimated the weight of it at eight tons per acre, making in all 1,133 tons used at my works. This produced 16,100 gallons, or an average of about 14 gallons per ton. The actual time in making the above was 39 days of 24 hours each. I lost some time through the working season, which reduced the average yield very much. In one case I obtained 76 gallons from a quarter acre of cane. If my cane would average 140 gallons, and the State at large only 89 gallons, it is evident some of the cane is worked at a great loss. The cost of manufacturing the past season, to me, was six cents per gallon, not counting interest on investment—only labor and fuel being taken into account. If the cane had been as good as in 1879, it would have reduced the cost at least one-fifth. If the crop could have been worked 39 days from September 1, instead of being delayed into November, a much better yield could have been shown.

There were produced 7,317 acres of cane. If the yield is based on last season's average, we would have 549,383 gallons. But as better machinery is fast being introduced, it is presumed the actual figures when obtained will be much greater. The question now asked me is, 'What are the prospects for a market for another year?' If it was positively known that there would be a good, reliable market, the crop could be largely increased next season; there is but one small refinery in this State, and a ready market cannot be obtained as soon as the sirup is produced.

Many years' experience has satisfied me that three and one-half feet each way planted in check-rows is the best way, and always plant a liberal supply of seed, as it is much easier to thin out than to hunt for two or three scattering stalks, especially if the land is weedy. Another thing: If the season is cold, with heavy rains, or if some hills are covered more than one-half inch deep, if you do not have a good stand, you cannot raise a good crop. As soon as you can follow the rows I think it pays to stir the soil close around the hill to give the small plant a chance, so that it does not get choked with the weeds.

In harvesting a crop of cane it is my opinion that all that can be used safely without freezing should be worked from the hill or within two or three days from that time. I have reason to believe that if the cane can be cut and allowed to lie till the leaves are partly dried, on large mills a saving of labor can be made; but in smaller operations I should favor stripping if the cane is to be piled to remain, and in large piles stripping is absolutely necessary, as the leaves shut out the air and the cane will heat and mold. Cane stripped and bound in 40 or 50-pound bundles, each tier crossed, and a space of two feet between piles, if piled perfectly dry, will keep a good many days without damage. For putting up several hundred tons near a mill this would be my plan every time. I found whatever damage there was this way was from two causes: First, if piled when wet; second, if piled nearer than two feet from other piles. A little practice will enable you to give the piles a little slope on the top. We found if the cane was stripped and bound the teams could haul twice as fast. To do a successful business the shed should cover the mill and the cane; in two or three days of rainy weather, if the works are of large capacity, the product will pay all the cost of the shed.

Cane-juice contains a vegetable acid that enables the manufacturer to make a light-colored sirup, but the acid helps to hold quite a per cent. of vegetable matter that gives much of the strong cane taste. A sufficient amount of lime to nearly neutralize the acid removes most of the vegetable taste, which arises in the scum; the juice if left a little while settles tolerably clear, removing most of the cane taste. This treatment requires more skill and good judgment than all the rest, and the great lack in the North to-day is skilled labor in this department. Unless one has his sirup contracted to responsible parties I do not think it a safe investment for new beginners that have not had any previous knowledge. They can be more certain to make a crude article successfully the first season. If I were to advise new beginners I should say to them, better give some successful man your time, if need be, or employ skilled labor to assist you, especially in the department of defecating. Evaporating requires the same or nearly as much skill. A good article of sirup will always sell as well as good corn or other grain.

The past season I first tried the porous alum jelly, using it in the same proportions as generally recommended. I do not like the results. I then tried lime alone, a trifle more than a quart of cream of lime and about as thick as cream, to 100 gallons of juice; I boiled to about 220° on a Cook evaporator, and finished the product with a steam-pan, with a coil of inch pipe. I think one-and-a-half-inch pipe would be better, and copper pipe is best of all. This sirup, if boiled for sugar, should never be put hot in barrels. Remember in cooling the product, you cannot be too quick about it. In fact, the whole business requires dispatch to be successful.

If the product weighs 11½ pounds to the gallon this is standard weight at the Belcher refinery, and ought to be in this State. Some of the product will grain, if the cane is in condition to make sugar, twelve pounds per gallon, if well defecated, and I doubt if it is advisable to boil it heavier than that, as you will, with open pans, destroy more sugar than you will gain beyond that point. I have boiled it heavier, but do not advise it. Making sugar from amber sirup when the cane is in good condition with good defecation, with lime so the litmus paper will look nearly blue, and then the lime neutralized with porous alum, or, as some call it, sulphate of alumina, one pint of the solution to 200 gallons of juice put in after the treatment of lime, I have made sugar in paying quantities.

I never have had a doubt of the future of this industry. It was 15 years after the introduction of sugar-cane in Louisiana before the first sugar was obtained. Two years ago the sirup granulated beautifully, which was my first knowledge of clarifying with lime. Although the past season I made no sugar, my season's work paid me well. I paid $2 80 per ton for the cane delivered to the works in bundles. I think it can be delivered for $2 50 and be a profitable crop for the grower and manufacturer. The expense of good works that will work 100 acres, with sufficient buildings, involves quite an outlay, and the manufacturers have to take many chances that the grower does not share in. I think it better for the manufacturer to produce his cane, rather than pay more than $2.50 per ton, as he will then secure a profit in addition to the manufacturing.

From the Scientific American we learn that Mr. William H. Older, of Packwaukee, Wis., has patented an improved construction of buildings designed especially for barns upon prairies and other parts of the country where timber is scarce. A peculiarly constructed frame of timber and wire, the timbers being secured by bolts, is the principal feature of the invention. The outside may be covered with straw thatch, tarred paper, etc. A serviceable building can thus be constructed with little timber and at a small cost.

Also that Mr. Ura H. Palmer, of Elizaville, Ky., has patented a wheat heater for flour mills, in which the grain is heated by the direct contact of hot air, the air being heated by a lamp and circulated in currents through perforated tubes, among which the grain passes by virtue of its own gravity.

Mr. Charles Niederauer, of La Grange, Texas, has patented a cultivator in which the standards may be adjusted to regulate the depth of the cultivators or plows to avoid obstructions. Each cultivator or plow standard has attached to it an adjustable segment, and the standards are all operated together by lever and link connections. The plows are thus raised, while the main frame upon which the operator rides is not raised.

Mr. Julius Holekamp, of Comfort, Texas, has patented a seed planter whereby corn, sorghum, beans, rice, cotton, etc., may be planted in hills or drills, and so constructed that the seed may be planted in any desired quantity, and at any desired distance apart, and with the rows at any distance apart.

The sample man of the Mark Lane Express says that when Judge Jones says there is nothing the matter with American cattle, it is no matter what Judge Jones says. He denies that foot-and-mouth disease exists in the United States, though under the name of epizootic aphtha, it is spoken of as a common disease by United States papers. He has even questioned whether any cattle affected with contagious pleuro-pneumonia have been sent to England. Like the ostrich he puts his head in the sand and will not see what he wishes to have ignored. When in that country a short time back, he did not talk as he writes now in the Chicago Live Stock Journal.

Now putting aside all claims to the superior nutritive value of ensilage over green fodder, the Maine Farmer contends that the advantages are of sufficient importance to demand a careful consideration before the process is condemned as of no value. It is a very difficult thing to dry green corn fodder in the sun, and a rain storm will wash out twenty-five per cent. of its value very quickly. If packed away in the barn when too green, it heats and molds and becomes poisonous. If it grows stout and long, like that described by Whitman and Burrell, but little more than half of it can be eaten by the animals, whereas when cut up and ensilaged, it becomes soft and is easily masticated.

The "Mammoth," or "Russian," *sunflower* is one of those plants which are periodically "pushed" and recommended as furnishing not only the best food for poultry, but also excellent fodder for cattle, and always ready kindling material for the kitchen stove besides. Dr. Hexamer tells the N. Y. Tribune that he has tried it, and would not take three acres of sunflowers for one of corn. His hens prefer the corn, his cows the corn-stalks, and the cook the corn-cobs for kindling material. Farmers as a rule know a good thing when they see it, and when a crop has been recommended as persistently and as long as sunflowers, without finding more favor, there is generally some material defect about it.

Says the Indiana Farmer, "A Warrick county farmer recently lost eleven horses and mules from eating corn-stalks, which being cut up formed indigestible balls in their stomachs, producing death in a short time."

Everywhere.

NOTES FROM THE SOUTHWEST.

This immediate vicinity is being transformed by the vegetable business. I doubt if 500 cars will measure the business this year. All round the city land is taken up in gardens. Potatoes, cabbages, peas, beans, lettuce, onions, etc., are raised. People from a distance are coming in. Our markets are St. Louis, Chicago, Louisville, Cincinnati, Indianapolis, etc., none of them 48 hours away by express, and within safe distance by fast freight. Up the Mobile and Ohio Railroad the work of raising fruits and vegetables has reached, in spots, as high as Meridian, Miss. Doubtless there will be a great business in this in the future, as there are millions of acres of Government land homesteadible in a beautiful, healthful country, where there is an abundance of fine marl.

In this pine-woods belt sheep raising is to have a great future. Most of the lambs have already been dropped. Sheep are wonderfully fecund, multiplying at the rate of 100 per cent. per annum, very healthy, and cost little or nothing for maintenance, there being millions of acres for range. There is a great demand for the wool, and, as it is of very fine quality, it sells as high as 60 cents per pound for unwashed Merino on the spot where raised. People from a distance are just beginning to appreciate this business. In the next few years the pine-woods of Southeastern Mississippi and of Southern Alabama will be great sheep-walks.

In East Mississippi, in the superb prairie belt, stock raising is receiving a great impulse. Many parties, within the last two or three years, have sown grass and bought stock. Fine fields of clover, Blue Grass, Meadow Fescue and other grasses are to be found. People by the score are raising one kind of stock or another. Three years ago you could have counted all the stock raisers in Eastern Mississippi on the fingers of both hands; now there are a hundred, perhaps. The Stock Breeders' Association was organized there in January, 1879, with 11 members. Even some of these had no stock. Now there are nearly 300 members. Some of the most influential men in the State are stock raisers. The cattle are Jerseys, Short-horns, Devons and Galloways. The sheep are mainly Merinos, Cotswolds and South-Downs. Diversified industries seem to have been better illustrated in Eastern Mississippi than in any other portion of the State.

Another novel industry, for the South, is the raising of peppermint for distillation. The past year it has been proved by several trials to be a great success. Two gentlemen from Michigan tried the herb in five or six different localities. It proved so great a success that they are planting to their utmost capacity. It can be cut twice a year, and makes as good oil as is to be found anywhere. The richest sort of black prairie soil is to be had at from $8 to $10 per acre, and the mint raisers of Michigan say that the industry in Mississippi defies competition.

The planting of the Castor Bean is being agitated, with expectations that in a year or two it will be a most profitable and engrossing industry. The plant is very prolific in the South; its long season of ripening is greatly in favor of its cultivation in this section. It bears enormous crops and is wonderfully vigorous. A great feature is that the cotton-seed oil-millers will greedily buy up all the beans, to give employment to their mills in the Summer and save them from being idle so long a time every year. This gives a home market, with active competition among the buyers. In a few years you may look for thousands of acres, aye, tens of thousands, to be planted under this beautiful crop.

Another very hopeful sign for that country is that immigration is beginning to come in; not much just yet, but the influx has begun, and those who have come have come to stay. Men from Kansas and Michigan and, maybe, from other States, have come down and are well pleased, and their friends will soon follow. Almost everything that is needed can be raised there. Wheat and cotton, corn and sugar-cane, rice and clover, rye, barley, buckwheat, all the vegetables and many fruits will grow side by side in the richest of soils, a fine climate and as healthy a country as is to be found, with land that once sold at $50 to $100 per acre, for sale now at $8 to $15.

One of the most gratifying of all demonstrations is the success of the Agricultural and Mechanical College of Mississippi. It has been open six months. No one ever suspected that it would have over 200 students, if that many, for years; yet, in less than three months, there have been over 300 matriculations, and I suppose over 200 have been repulsed for want of room. No college in this country can compare with it. A perfect *craze* for an agricultural education seems to have seized the State. The most distinguished and wealthy men, from members of the United States Senate down, are sending their boys there to make farmers of them. At this college compulsory farm labor is a part of the *curriculum*. Each boy must work three hours per day for five days in the week. He must plow, harrow, dig ditches, hoe, fence, do anything that is needed to be done on the farm—a farm of 800 or more acres, utterly poor and out of shape. Military discipline prevails, too. The boys have to rise early, make their beds and keep their rooms tidy. They have to drill every day. They have to go to bed at a certain hour. They are under discipline most of the time. They study under the watchful eye of the "officer of the day." At night they are under espionage in their rooms. The corridors of the dormitories are patrolled by students all night, as sentinels. M. B. H.

Mobile, Ala.

RURAL SPECIAL REPORTS.

Ark., Poteau, Scott Co., Feb. 21.—Since January 1st, there has been an unusual amount of snow here, but the weather has not been so cold as in December. The ground has been entirely clear of snow only twice since November. For the past few days the prospects have been good for some Spring weather (in fact, the maples are in bloom); but at present the outlook is good for a snow-storm. This Winter has been a very unfavorable one for farming. Many who hadn't their cotton picked when the November "squall" came will have it to pick this Spring when they should be preparing their land for another crop. In this country we generally sow oats and break corn land in this month; but the weather will not admit of breaking land this year. It is feared that fruit is killed in the bud here, but as far as I have examined, I find that it is all right, although some trees are winter-killed.

H. C. B.

Ill., Pana, Christian Co., Feb. 23.—We have had a long, steady, cold Winter. From November 15, things have been frozen up solid, with but little snow; the depth of it has not exceeded at any one time more than five inches. We have had only very little sleighing, but the best of wheeling, the ground being bare but frozen. Winter wheat is all right so far as I know, having given my personal attention and a close examination to 40 acres of my own, of which 28 acres were sown in due season and 12 acres of such late sowing that it barely came up before Winter set in. I am satisfied it is all good. Peaches are undoubtedly killed. As to apples and cherries, they are all right.

D. B. P.

Ill., Highland, Madison Co., Feb. 18.—Apples are sound yet, at least the buds I examined were so. Peach trees are, I believe, frozen nearly to the ground. Among pears and sweet cherries the buds I looked at were all frozen. Of small fruits I can say nothing; neither can I of grapes. C. L. B.

Iowa, Aplington, Butler Co., Feb. 15.—We have had a long, cold Winter, with plenty of snow. Rail and wagon roads have been blocked badly. We have had 38 snow storms already. Hogs are about all sold, but we have some beef cattle here yet. Not much wheat was raised here last year. Farmers go in pretty heavy on flax, which is worth about $1 per bushel now for seed; oats, 21c.; corn, 20c. L. E. C.

KANSAS, Washington, Washington Co., Feb. 14.—We have had a very cold Winter, it froze up November 9th and has been steadily cold ever since. The thermometer went down to 24 deg. below zero once. The peach buds are all killed as far as I can find out. Wheat that was put in right is doing well, and is not winter-killed so far. On Saturday, the 5th, it commenced to rain and rained until in the night when it turned to the biggest snow-storm of the season. Stock is wintering well. Fodder is getting scarce; if the cold weather should hold much longer it will be high in the Spring. Prices of grain, are:—Wheat, 65c to 75c; corn, 20c; hogs, $4.15 per hundred pounds; butter, 15c per pound. J. G. B.

KANSAS, Harlan, Smith Co., Feb. 18.—Prospects for crops the coming season are most flattering. Abundant rain in the Fall, and a good deal of snow through the Winter—that is, for this country, where we seldom have much. There has been very little thawing since the first freeze. Warm rain the 5th inst. softened the ground a few inches and was followed by about eight inches of snow. The severe weather will probably kill the insect pests, which were as injurious last year as the drought. Winter wheat is reported to be in excellent condition. F. E. H.

KANSAS, Leavenworth, Leavenworth Co., Feb. 13—I have just been examining the fruit buds of apricots, budded peaches, and Heart and Duke Cherries and find many killed; but enough good ones are still left to make a fair crop of fruit except of apricots, of which only a few are left. J. B.

KAS., Caldwell, Sumner Co., Feb. 23.—The coldest weather down here in Southern Kansas was 14 deg. below zero when we had a three days' blizzard which began on Feb. 13. S. K.

MD., Denton, Caroline Co., Feb. 19.—The bearing peach trees in most of the orchards in this vicinity were frozen down to snow line—8 to 10 inches above ground. The bark peels off neatly, as far down as frosted, as in budding season. Young peaches in nurseries are killed down to snow line, so are tender varieties of cherry. Such a freeze has never before been known to occur here. Some claim the 'Queen of the Market" Raspberry to be unhurt, but Brandywine, and Wilson Blackberries have succumbed to the "pressure." J. W. K.

MICH., Three Rivers, St. Joseph Co., Feb. 26.—The Winter has been pretty cold here. We had not much snow until January, but since then we have had sleighing, except for one week, during which a great deal of rain melted the snow. The wheat looks bad. It was sown late and accordingly it had very little growth on the advent of Winter. Corn was two-thirds of a crop. S. M. S.

MICH., Evart, Osceola Co., Feb. 15.—This is a new country and hitherto lumbering has been the chief business here; but now splendid farms are being made out of the land that has been cleared of pines. We are having a cold Winter, with the mercury frequently down to 28 or 30 degrees below zero, and the snow three feet deep in the woods. E. O. T.

MINN., Fremont, Winona Co., Feb. 20.—We have had an old-fashioned Winter in this section. It froze up on the 11th of November and has not thawed out since that date. All kinds of stock have been in good order thus far. Farmers are beginning to stop raising all kinds of wheat, and are raising more stock and going into mixed farming generally. Stock is fetching fair prices; that which formerly brought from $10 to $15 now brings from $15 to $30. Oats, 28@30c.; corn, 30@35c.; hay, $12 ₱ ton; wheat, 80@90c. J. G.

N. Y., Croton, Delaware Co., Feb. 12.—The old adage

> When the days begin to lengthen,
> The cold begins to strengthen.

is being verified this Winter in Delaware Co. Our cold December was followed by a January equally severe, and then February started off a little ahead of either of the other months. On the second my thermometer indicated 24° below zero, four degeecs lower than it has been here before. E. J. B.

N. Y., West Croton, Delaware Co., Feb. 17.—Cold and blustering here now. Snow 20 inches deep on the level. Hay worth $18 per ton and scarce at that. I fear a good many farmers will run short of fodder before Spring. Dry weather and grass-hoppers have done a world of mischief here. D. H. C.

N. CAROLINA, Charlotte, Mecklenburgh, Feb. 21.—We have had three or four weeks of extremely cold weather this Winter—more severe than it has been for many years. The young pine trees in many places, the leaves being killed, look as if fire had run through them and scorched the leaves. On the river and creek banks the blades of the reeds are killed. I have never known this to happen before. Rose bushes are killed to the ground. W. J. H.

PA., Salem, Clarion Co., Feb. 19.—We have had an extremely cold Winter, the thermometer being very often down to zero and as far as 24° below—lower than it was ever before known in this section. Wheat, $1 00; corn, 30c.; oats, 40c. hay, $10 to $16 per ton. E. R.

TEX., Birdsdale, Bell Co., Feb. 10.—Never in the memory of the oldest man living, have we had such a season—from a severe drought to almost incessant rainy or cloudy weather up to the end of January. Much of the cotton crop was not gathered, and but very little of an immense corn crop was harvested. No Fall wheat was sowed. No Spring wheat or oats are yet planted, and it is still cloudy, misty, icy and cold with mud! mud! everywhere. People on the prairies are getting out of wood, in fact, in some places, they are now using cotton seed for fuel. It has been exceptionally cold here since the middle of November, with ice, snow and frost enough for at least six ordinary Texas Winters. E. G. H.

VA., Middleburg, Loudoun Co., February 22.—The peach crop in this vicinity will be a total failure, the buds having been killed by the severe cold weather. It is feared too, that the peach trees are seriously injured. W. C. B.

WASH TER., Colfax, Whitman Co., Feb. 12. We have had a long, dreary Winter. The ground has been covered with snow since the last week in November, and as a great many stock-men here prepare no feed for Winter, depending upon bunch grass alone, much stock have perished, especially cattle and sheep. Horses fare better as they will dig through several inches of snow and keep in very good order. The "Chinook" is gently blowing to-day—a warm wind that melts the snow very rapidly. It has been anxiously looked for, as there is plenty of grass if it could only be uncovered. Wheat, 35c.; oats, 45c.; hay, $10 to $15; butter, 37½c.; eggs, 37½c. H. M.

The Querist.

ANSWERS TO CORRESPONDENTS.

The Improved Kentucky Sheep.

A. B. M., Le Seur, Minn., asks for some information about the Improved Kentucky Sheep, of Robt. W. Scott.

ANS.—Forty-six years ago Mr. Scott, not finding any sheep suitable for the West and South, resolved to produce one by judicious crossing. Accordingly in the beginning of 1834 he selected about 30 ewes from a flock of common or "native" sheep, and bred them to a very fine large Saxon Merino ram, the object being to give in the offspring more thickness to the fleece and more fineness to the fiber of the wool before uniting the coarse fleeces of the native sheep with the coarse and still more open fleeces of the large imported breeds. The ewe lambs of this cross, when one year old, were bred to an imported Bakewell Leicester buck, of large, full, round carcass and of heavy fleece of long wool. In due time the ewe lambs of the latter cross were, in turn, bred to an imported South-Down ram of large size and high form, the object now being to infuse into the progeny the active, sprightly and thrifty disposition and the highly flavored and beautifully marbled mutton for which the South-Down is celebrated. Here again success was achieved, the flesh of the wethers being highly prized, while the value of the wool was increased as much by the greater number of fibers to the square inch, as it was lessened by the loss in the length of them. The next cross was by a ram possessing many of the good qualities it was desired to perpetuate in the flock. He was three-fourths Cotswold and one-fourth South-Down—a large, hardy, active sheep, with a thick and heavy fleece—qualities which he transmitted to his progeny to an eminent degree. The next two crosses were made by pure-blood Cotswolds and the next by a full-blood Oxford ram of remarkable softness and silkiness of fleece. All these animals had short necks, round barrels, broad backs and full briskets. These increased the weight of the carcass and fleece of the flock. Every one of the crosses, Mr. Scott says, was perceptible in the flock in the character and habits, as well as in the carcass and the fleece, though in some a particular cross predominated.

In 1853 the flock was divided between two full-blood Cotswolds, and in the following year it was bred to five select rams of Mr. Scott's own breeding in order to produce more uniformity. For the same object in the Fall of 1855 the ewes were bred chiefly to a ram whose pedigree showed a mixture of Cotswold, Oxfordshire, Teeswater and South-Down blood. In 1856 Mr. Scott says he bred chiefly to a large Cotswold buck, and in 1857 he bred to the same and to another ram of mixed blood, the ewes being so mated as to produce greater uniformity in the flock—those with more marked South-Down and Merino characteristics being bred to the Cotswold and those with Cotswold qualities being mated with the mixed-blood ram. In 1858 two large rams of his own breeding were used in the same way and for the same object. In 1859 about 100 ewes were picked out and bred in the same manner, for the same end, about half of them being bred to a fine mixed-blood ram which had gained a premium at the State fair the previous year, and the rest to a choice ram of what had now become known as the "Improved Kentucky" breed.

By this time the sheep were essentially uniform and imparted their qualities to their progeny as certainly as do other breeds of sheep. They had also become well known, having been successfully exhibited at many State and County fairs, and some of them had been sold in nearly every State of the West and South. Since 1860 judiciously selected rams of his own breeding, and others of Leicester and Cotswold blood, have been used so as to impart some desirable quality to the carcass or fleece or to strengthen the constitution of the progeny. Only the most healthy, finely-formed and well wooled ewes are kept as breeders, and great care is taken to secure rams of like character. The fleeces of Mr. Scott's flock of over 100 breeding ewes have averaged over eight pounds of merchantable wool, free from burs, etc., and though it was not washed on the sheep's back, still he thinks it was clean enough for domestic manufacture. The weight of the fleeces varies from eight to fifteen pounds. The wool, he says, is exceeded in length only by that of the Cotswolds, while it greatly excels that of the latter in fineness and softness of fiber and in the number of fibers to the square inch on the sheep's back. Although the fleeces are not quite uniform in length, thickness and fineness of fiber, still there is as close a general uniformity as in most other breeds. The entire body, except the face and legs below the knees, is covered with a close and compact fleece, which, when full-grown, leaves no open line along the back, but gives a perfect protection and a smooth, handsome and portly appearance. Though the fleece has sufficient yolk to preserve its softness, it has not enough to produce a dirty appearance. Mr. Scott says that the wool has generally commanded from three to five cents per pound more than any other combing wool in the neighboring markets.

Mr. Scott's flock never have any artificial shelter in Winter or Summer, yet they have always thriven well and been always almost entirely free from disease, especially from coughs, snuffles and foot-rot. In Winter short grass is all they need, and in its absence they are content with fodder corn, though, of course, at lambing time they require a more succulent diet. He has also heard good accounts of the thrift and hardiness of those he has sold to other sections where the climate is more severe than it usually is in his section of Kentucky. As to the prolificness of the dams, he has often raised one-third more lambs than there were ewes, and has rarely failed to raise a lamb for every ewe in the flock. He has not sacrificed other good qualities to size, but among the weights are 174 pounds for a yearling ram; 224 pounds for a two-year-old ram never shorn; 162 pounds for a grown ewe; 114 pounds for a ewe lamb—all weighed off grass without any extra feed, some of them in August.

The Phylloxera.

W. E. M., Wallsville, Pa., asks for an account of the phylloxera that is proving so injurious to grape-vines.

ANS.—The term phylloxera designates not only the insect, but also the disease it produces. The phylloxera insect occupies an intermediate position between the plant lice (aphidæ) and the bark lice (coccidæ), though in most respects more closely allied to the former than to the latter. Although the genus was first discovered in Europe by Prof. Planchon in 1868, yet it is more largely represented on this than on the other side of the Atlantic, for while there are only two discovered species indigenous there, there are 16 described species here, most of them inhabiting galls upon the leaves and twigs of hickory, oak or grape-vine. But none of these, except the phylloxera of the grape-vine, seriously affects man's interest. In 1869 M. Lichtenstein, of France, suggested that the insect which was ravaging the vineyards of his native land might be the same described by Dr. Fitch as making galls on the leaves of American grape-vines, and in 1870 Prof. Riley proved that this suggestion was true. At the same time he also proved—what was discovered simultaneously in France—that the grape phylloxera presents itself in two different types, one making galls on the leaves of grape-vines and the other affecting the roots. This hibernates mostly as a young larva attached to the roots. In Spring it moults, increases in size and begins to lay eggs. These eggs produce young which soon become virginal, egg-laying, wingless mothers. Five or six generations of these follow each other, and then, about July, some winged female insects appear. These fly to new vines or vineyards where they lay eggs, usually two or three in number, and then die. These eggs are of unequal size and in about a fortnight they produce sexual individuals, the larger producing females and the smaller, males, the latter being wingless and mouthless. The impregnated female produces an egg, which in its turn gives birth to a virginal, egg-bearing, wingless mother, which begins again the same round of reproduction. The insects spread in their winged state by flight from vineyard to vineyard; and in their wingless state from vine to vine, or even from neighboring vineyard to vineyard, either through underground passages or over the surface. The winged females begin to appear in July and continue to swarm out of the ground until vine growth ceases. The gall lice are found on all species of grape-vines, but least on the European vine—Vitis vinifera, and most on the River Bank Grape (V. cordifolia), and especially on the Clinton and Taylor. The root lice are most disastrous to the European vine, and least to our Summer Grape (V. æstivalis) and the Scuppernong. Of native vines, the most liable to the pest—the Catawba, Iona, Delaware and Goethe—belong to the Northern Fox (V. Labrusca). The puncture of the root lice causes knots and swellings of the roots, which begin at the tips of the rootlets which eventually die, when the lice migrate to fresh feeding ground. During the first year there are scarcely any visible signs of disease. During the second year all the fibrous roots disappear, and the formation of others is prevented by the lice which also settle on the larger roots which their ravages cause to rot. The symptoms of the disease now are seen in the sickly yellowish appearance of the leaf and a small growth of cane; and about the third year the vine dies; but then an examination of the roots will generally fail to discover any of the pests, all of which have by that time sought "fresh fields and pastures new."

Lime and Ground Limestone, etc.

E. R., Salem, Pa., asks, 1, for some information on limestone crushed or ground and burnt; and whether the former would prove beneficial on a limestone clay soil; 2, how would one get the most benefit from barnyard manure that has been left in the open yard, and has been frozen all Winter without having rotted at all—should it be hauled out in the Spring for corn, or left to rot until Fall for wheat.

ANS.—1, Ground limestone is of no value on a limestone soil which has already abundance of limestone in it. Where the soil is quite devoid of lime finely ground limestone might be of service; but only on soils that have plenty of vegetable matter in them from the decomposition of which carbonic acid is produced. Limestone is soluble only in water which contains carbonic acid, and it is therefore only in rare instances that it can be used with advantage. But lime is useful on all soils, because being freed by the burning from the carbonic acid, combined with it in the limestone, it is in a caustic condition and a very active decomposing agent of both organic matter, from which it takes carbonic acid again and of mineral matter from which it takes silica and so sets potash and soda free from their combinations as silicates and carbonates in which they are insoluble. Therefore lime is found very useful even on limestone soils, and it is really upon such soils, and where it is consequently cheap on account of its neighboring proximity, that lime is most extensively used. It is most useful on clay soils. 2, The manure would do the most good on the corn; if it is too coarse to be harrowed in on the plowed ground, it should be spread as soon as possible, and plowed in, when it will be well-mixed with the soil by thorough harrowing. See Farming for Boys and Girls No. 6, December 11th, 1880, where this is explained.

Farcy, etc.

W. H. C., Thompson Station, Tenn., asks, 1, where can he procure a small package of Silver Chaff wheat; 2, what will cure his mare of a skin disease called "farcy."

ANS.—1. We do not know just yet where Silver Chaff wheat can be bought. 2, Farcy is closely allied to glanders, both depending on the same poison in the blood, but while the poison in glanders is thrown off by the nostrils, in farcy it is eliminated through the skin. As it is usually the result of extreme neglect and exhaustion, we doubt whether it is really the disease that affects our friend's mare. The malady usually first shows itself by one, two or more lumps or hard enlargements in the skin of any part of the body, but generally in the thin skin on the inside of the thighs and arms, or the neck or lips. These are called "farcy buds," or "buttons." They soon soften and burst or are opened. The sore, however, does not heal after discharging; but the edges grow rough and the center becomes pale and moist. Then on pressing the neighborhood of the sore, cords more or less thin and hard will be felt running from it to other lumps, which form one after the other, until the skin becomes ulcerous. As the disease progresses, the appetite fails or becomes voracious; thirst becomes agonizing, and glanders breaks out. As with glanders, there is no cure for farcy, and as the disease is contagious, and glanders may be "caught" by human beings with results horribly fatal, all affected animals should be slaughtered and put out of the way at once. Sulphate of copper or of iron, oak bark, Cayenne pepper and cantharides may give temporary relief, but a speedy death is the safest remedy for either glanders or farcy.

Corn and Oats as Soil-Exhausters.

A. C. T., Normal, Ill., asks which will impoverish land the most—a crop of corn or one of oats.

ANS.—It is very satisfactorily shown that a crop of corn is easier on the soil than a crop of oats. It is far easier to produce 60 or 70 bushels of corn, weighing 3,600 to 4 200 pounds, to the acre, with three or four tons of dry fodder, than 50 bushels of oats, weighing 1,600 pounds, and a ton of straw. This is accounted for by the fact that corn is able to procure a large quantity of its nitrogen from the soil where oats cannot, and that a good crop of corn can be grown with the help of potash and phosphoric acid alone, and yet show in the crop a large quantity of nitrogen, while oats cannot be grown without the nitrogen added to the other manures. A great many experiments have been made in this direction with this effect. Now, as nitrogen is the most costly ingredient of both fertilizers and of feeding stuffs (of which manure is made), it is considered that the crops which need the most of this element to be supplied for their growth, are really the most exhausting crops. Oats are generally considered by practical farmers to be unusually "hard on the soil." The writer has grown good crops of corn on the same plot five years in succession, and the last was the best of all; but he has never heard of oats being so grown.

Scab in Sheep.

R. G., Lewisville, Ohio. has in his flock a few sheep that bite, and pull the wool from, their sides; there seems to be a sort of scurf on the skins; all the rest of the flock are doing well, and he asks what ails the afflicted sheep and how to treat them.

ANS.—This is very probably scab, a most troublesome and contagious disease. At any rate the case is so full of suspicion of this disease that great caution should be used lest it may spread to the rest of the flock. Separate the diseased sheep and treat them as follows. Steep one pound of cheap plug tobacco in one gallon of boiling water, but do not boil it. Stir in four ounces of flowers of sulphur and let it stand until it cools so that the hand can scarcely be held in it for a minute. Then rub this liquid on to the scurfy parts with a corn cob, breaking up all the small pimples and soaking the skin thoroughly with the hot liquid. Go over all the affected sheep in this manner, and in ten days examine them, and if necessary, repeat the operation. There is no other remedy for scab. If it is only a simple irritation of the skin caused by the dry feed, give one ounce of Epsom salts and wash the parts with salt and water. But as it will do no harm to use the tobacco and the risk of scab is serious it would be advisable to treat the sheep for that disease. The salts may be given in any case.

Gas Lime.

A. P. H., Galesburg, Ill., asks, 1, what is the value of gas lime as a fertilizer; 2 is it beneficial for loosening ground that is hard to work; 3, if good, how much of it should be used per acre.

ANS.—1. In its fresh state gas lime contains sulphuretted hydrogen and other sulphur compounds which are poisonous to vegetation, and it should never, therefore, be used until it has been exposed for two or three months to the weather. By this means the injurious compounds are changed by oxidation into harmless, if not useful, substances, leaving the lime in the condition of carbonate or mild lime, with some sulphate. In this state it is beneficial to such crops as would be benefited by an application of caustic lime. About 100 bushels per acre might be used with about the same effect as 40 or 50 bushels of ordinary caustic lime. 2. Yes, under the same conditions as caustic lime; but, of course, more of the gas lime can be used, and its mechanical effect, therefore, would be greater. 3. That would depend on the condition of the soil, but somewhat over double as much as would be required of common caustic lime.

Comparative Value of Feeding Stuffs.

F. R., Dundee, Ohio, asks what is the comparative value for fattening stock of ground cotton seed, cotton-seed-cake meal, linseed-cake meal and corn.

ANS.—The composition, nutritive value and market value of the foods mentioned are given as follows:

	Flesh-formers	Fat-formers	Nutritive value compared with hay at $15 per ton	Cost per 100 pounds
Cotton-seed-cake meal	41.5	31.4	$3.60	$1.75
Linseed-cake meal	32.4	31.5	$2.98	$1.00
Corn	9.1	70.4	$1.65	$1.00

The whole cotton seed is less valuable than the cake meal because of the larger proportion of indigestible husk contained in it. The linseed meal made in Cleveland is deprived of every particle of its oil by a chemical process, and is therefore less valuable than the ordinary meal; the former sells at $25 a ton, and the latter at $40. Cotton-seed meal is the richest feed of all, but its costive effects on the cattle make it inadvisable to feed it in such quantities as might otherwise be profitable.

Soiling.

C. H. B., Hamett, Pa., asks whether soiling cows would be likely to pay thereabouts; which are the best crops for soiling; how much land would be needed to keep a cow by the system; and how should the business be conducted.

ANS.—With good management soiling may be made a very profitable practice. No dairy can well be managed without it, excepting where land is very cheap and one has abundance of grass and pasture. One cow has been kept on an acre the year round by a good system of soiling, but it is very easy to keep a cow on an acre and a-half or two acres. The crops usually grown are Winter rye or wheat for the first green fodder to be cut in May and June; clover and grass to be cut in June and July; oats, or oats and peas, to be cut in July and August; corn to be cut in August and up to November with Hungarian grass or millet if need be; then mangels for Fall and Winter feed with dry corn fodder and hay until the rye comes again the next Spring. It is necessary to plant the crops for cutting at intervals so as to have them fresh and not too ripe.

Composting Animal Matter.

G. E. N., Afton, N. Y., says he is thinking of getting deacon'd calves from farmers in the Spring, and composting them for manure, and he asks how this should be done.

ANS.—Deacons, or immature calves, should be skinned as the skins are of considerable value. The flesh and bone will weigh probably 60 pounds, containing 15 pounds of dry matter worth at least one cent a pound for composting. As the flesh contains a large portion of nitrogen, some earth or swamp muck should be mixed with the horse manure to dilute it. A compost heap containing animal matter of any kind should be made as follows: a foot in depth of soil and sods or vegetable matter mixed; a layer of the animal matter such as deacon'd calves well sprinkled with lime and lightly covered with soil; a foot of horse manure; a layer of the animal matter sprinkled with lime as before, and then a foot of earth sods and vegetable matter. The heap should be well packed and tramped and made flat and hollow to hold the rain, and to preserve moisture.

Government Bonds.

J. D., address mislaid, asks, whether government four-per-cent bonds can be bought elsewhere than in large cities, and if so where can they be had by a person living in the country; where is the interest paid and how often; when do they mature; does it pay to buy them.

ANS.—The direct sale of the bonds is confined to large cities; but those living even in remote country places can buy them through the nearest bank. The interest is paid in January and July in large cities, but it can be collected, through local banks, just like a check on somebody in a distant town. The four-per-cent bonds were issued last year and run for 20 years, the government having the option of redeeming them after they have run ten years. Each bond of the par value of $100 is now worth about $113, and for any one who is content with a mere trifle over three and a-half per cent per annum interest on his investment, it will pay to buy them.

Arsenic for Heaves.

N. Rivenburg, Franklinton, N. Y. asks, 1, whether giving a mare arsenic or any other poisonous drug for "heaves" would prevent her from getting with foal; 2, would it injure a mare that is in foal.

ANS.—Arsenic is a dangerous drug to give any animal and especially when there are other remedies that are equally effective. Arsenic is given for the heaves under a misapprehension or a mistake that heaves is a nervous disorder. It is sometimes caused by a disorder of the nerves but is more often caused by irritation of the air passages by dust in the food or by chronic indigestion. The arsenic is given in very small doses as a nerve tonic, five grains being the usual quantity; it is impossible to determine beforehand what may be the precise effect of the drug in the particular way indicated, but as it is by no means a necessary medicine, it would be well to avoid the risks.

Grafting the Tomato on the Potato.

L. V. R. S., Providence, R. I., asks how the tomato is grafted on the potato, as alluded to in a late article in the RURAL.

ANS.—The grafting is that allluded to by Horticola recently. Briefly, it consists in growing a potato from a single eye, cutting the shoot down to two or three inches when it has grown about six inches high, and inserting a tomato graft by the method called split-grafting. It should be bound up with bast, tied to a stake to keep it from being moved by winds, etc., and shaded till union has taken place. The ground should be kept level, and below the point of grafting, or the result will be a failure.

Miscellaneous.

C. F. R., Tonawanda, N. Y, asks, 1, whether the books of the American Book Exchange are as well got up and bound as those of other publishers; 2, are Garmore's Artificial Ear Drums what they are represented to be; 3, is hemlock as good as pine in a barn where it is kept dry.

ANS.—1, The books are neatly gotten up and bound. The prices are so low that those intending to purchase a number of volumes can well afford to order a specimen work in advance. 2, We have been told by several parties that the ear drums were of no use whatever to them; while others again say that they can hear better with than without them. 3, The wood of the hemlock is coarse, splits irregularly and decays rapidly when exposed to the weather. It is stronger than white pine, gives a better hold to nails, and for all work not exposed to the weather it is preferred to pine, and for beams, rafters, roofs, sheathing, sides of frame houses, and rough work generally, it is equally good.

J. W. E., New York City, asks, 1, which part of Florida is the most healthful; 2, would we advise a young man with a family and in moderate circumstances to move to that State for the purpose of raising fruits for market; 3, in what part of Florida is the best land found; 4, are there any books that give trustworthy information about the State as a place for settlement.

ANS.—1, We do not know. There is but *one* way to ascertain, viz: by personal experience. 2, No, we should not, previous to such investigation. It is as hard to live in Florida by fruit growing as it is anywhere else with the disadvantage that old settlers have experience which new settlers have not. 3, For what purposes? 4, No, several pamphlets have been published for advertising purposes; but we hardly consider that sort of information trustworthy.

M. M. M., Orangeville, Pa., asks whether Alderney and Jersey cattle are the same.

ANS.—Yes, the Alderneys and Jerseys are substantially the same, the former coming from the small island of Alderney and the latter from its larger neighbor, Jersey. So few of the former, however, are being raised or imported into this country that the term "Alderney" has been merged into that of "Jersey" by all who are well posted in cattle nomenclature, although mistakes in the matter are still frequent among the "outside" public, and occasionally even among those who *ought* to know better. In reality the only Channel Islands cattle imported into this country are the Jerseys and Guernseys, the number of cattle ever landed here from Alderney having been extremely small.

L. D., Thorn Hill, Pa. has a colt rising three years old, that has had a bog spavin and thorough-pin since it was a year old. Blistering has done no good and he asks what treatment should be adopted.

ANS.—The animal should have absolute rest and the use of a high-heeled shoe is also advisable. The swollen parts should be subjected to pressure by means of a carefully adjusted truss and cold water bandages should be applied, after which a wash of tincture of arnica diluted with water should be used. It will require considerable time to effect a cure, and the safest and best means of causing it are pressure and applications of cold water.

J. R., Lawrence, Texas, asks how to remove a large wart from a calf's ear.

ANS.—The wart may be removed by tying a ligature tightly around its base, when it will drop off before long. Or, it should be touched daily with nitrate of silver to be had in a solid form from the nearest druggist; or again, it might be washed with a strong solution of the same. The safest and perhaps the best way to remove a large single excrescence of this sort, however, is by the use of the knife and the cautery. The cautery will stop the bleeding, destroy the root of the wart, and thus prevent it from reappearing.

L. K. W., El Dorado, Kansas, asks, 1, where the best books on Agricultural Philosophy, Botany and Chemistry may be obtained and the price of them; 2, can his subscription begin with Jan., 1, 1881.

ANS.—Johnston's Agricultural Chemistry ($1.75) Norton's Scientific Agriculture (75c.) Caldwell's Agricultural Chemical Analysis, ($2 00) Gray's Botany. All may be obtained at the American News Co., New York City. 2, We have no back numbers of the RURAL.

J. W. S., Jericho, N. Y., asks where can he get the revolving churn frequently spoken of in high terms by Henry Stewart in his articles on the Dairy Cow in the RURAL.

ANS.—The Churn is called "The Rectangular," and is made by Cornish and Curtis, Fort Atkinson, Wisconsin; but we suppose it can be supplied by any large dealer in dairy supplies as it has a very wide sale almost everywhere.

E. C., Los Moras Ranche, Menard Co., Tex. asks what is the nearest point at which to purchase Cotswold and Leicester rams for Texas.

ANS.—Kentucky is probably as near a point as any. W. L. Scott, Scott's Station, Shelby Co., Ky., has a fine flock. T. W. Samuels and Sons, Deatsville, Nelson Co., Ky., are also reputable breeders of these sheep. Leicester sheep will not do well in Texas. It will be a waste of money to take them there.

D. S., Northfield Center, Canada, asks where can he find the classical names applied to different kinds of wood.

ANS.—The names can be found in any good Latin and Greek Dictionaries; for, of course, when one speaks of the "classics," he refers to Greek as well as Latin. The botanical names of the trees from which the wood is made can be found in botanical works treating of the different genera.

M. F. C., Griffin, Texas, asks, 1, the address of the makers of the Lamb Knitting Machine, and, 2, which we think the better—the Lamb or the Twombly.

ANS.—1, Chicopee Falls, Mass. 2, The Lamb has a high reputation. Of the other we have no special knowledge, but we have heard it highly spoken of.

N. P. B., Macon Station, Ala., asks what is the price of the dog-power for churn lately advertised in the RURAL.

ANS.—The power is made by the Albany Agricultural Works, Albany, N. Y; the price varies with the size of the power. A postal card to the makers stating the requirements, will secure a speedy answer.

L. H. E., Chapman, Kansas, asks whether G. W. Pettebone & Co., of this city, are trustworthy.

ANS.—We would not have admitted their advertisement were it not that we were assured that the concern is trustworthy; but we have no word of commendation to bestow on such enterprises.

P. S. Logan., Ill., asks whether we will sell him a small quantity of the RURAL Branching sorghum.

ANS.—We have repeatedly published that we sell absolutely nothing except the RURAL NEW-YORKER, and for the information of our many new subscribers, we repeat the declaration.

F. N. G., No address, asks whether mangels that have been frozen and still continue so, can be profitably fed to stock.

ANS.—Yes; but the sooner they are fed after thawing, the better. If not used until some time after they have thawed, they are of very doubtful advantage.

J. W. C., Lovellsville, Pa., asks whether the Robbins Washer still gives satisfaction, and whether it can be used on a common stove.

ANS.—So far as we have heard it has proved quite satisfactory to purchasers. Yes, it can be used on an ordinary stove.

H. C. E., Neosha, Kansas, asks whether we will sell seed of the Rural Branching Sorghum to our subscribers, in addition to giving it in the Free Seed Distribution.

ANS.—We have repeatedly stated that we sell absolutely nothing except the RURAL.

G. W. C., Whiting, Kansas and several others ask whether F. M. Lupton, Publisher, 27 Park Row, N. Y. is trustworthy.

ANS.—He has the reputation of being so, and we have always so found him.

E. E. W., Cherokee, Iowa, desires to know what kind of incubator the RURAL would recommend, and the price.

ANS.—We are not prepared to recommend any at present.

Mrs. L. R. B., Benton, Co., Oregon, asks is there any such bean as the "Bulb," producing and growing from bulbs, without planting seed every year.

ANS.—We do not know of such a bean.

W. D. B., Brainard, N. Y., asks, where can he obtain a good creamery.

ANS.—The best are often advertised in the RURAL and will be soon again.

Several Inquirers ask where can they buy White Elephant Potatoes.

ANS.—They will be advertised in ample time in the RURAL.

H. M., Belen, New Mexico, asks whether there is any one connected with the RURAL who buys seeds on commission.

ANS.—No.

L. E. V., Botherell, Ont., asks for a description of the Lancaster Red Wheat.

ANS.—We have never raised it.

H. M. H., Graft, Neb., asks whether we can supply seed of Rice Corn.

ANS.—No.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, MARCH 5.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, MARCH 12, 1881.

In order to enable us to publish a part at least of the pressing matter which we have on hand and which has unduly accumulated owing to our special numbers, a supplement will be presented next week.

The Rural New-Yorker begs to offer in articles of its own selection, for the longest and heaviest five heads of wheat from the next crop, $50.00, to be divided into first, second, third, fourth and fifth premiums. The awards will be published in our Special Wheat Number, and drawings presented of the prize heads.

When we consider the variability of soil even in the same field—its natural fertility, and the different effects of different methods and degrees of cultivation, how is it possible to determine the value of different chemical manures upon certain other plots except by comparison with plots in the same field which receive no chemical manures and which are cultivated by the same methods and amount of cultivation?

Dr. Lawes in his comments upon the immense corn yields of last season at the Rural Farm (see first page), referring to another of his articles which appeared in this journal, says that he was not then so fully impressed as he is now with the great value of temperature for the production of nitric acid in the soil. "With corn," he says, "the most vigorous growth, and the most active assimilation of food take place just when nitrification is most active, but when the other cereal crops have done their work; no wonder then that the average yield of corn is above that of other cereals."

Whether the storage of apples, potatoes and kindred vegetables in our cellars has anything to do with developing diptheria, is a question worth considering. Our forefathers and foremothers who never heard of diptheria, buried their Winter vegetables in pits in the open ground. Perhaps in fifty years from now, there will be a return to the old custom, or, maybe, the "cellar" will be at the top of the house, and dwellings will be built on *terra firma*, with no vaults beneath exhaling damp and unwholesome vapors of decay, to be sucked into the bodies of the people up-stairs.

The unusual prevalence of small-pox the past Winter, has led to the establishment in various localities of vaccine farms where cows are kept for the object of supplying physicians with "points" for vaccination purposes. Very many people justly object to being vaccinated from the virus of a fellow mortal, as the mortal is most rare—even if he exist at all—who is entirely free from scrofulous taint in his blood. But from the blood of a fine, healthy young cow one has little to fear, and if something of her gently ruminating, motherly, mild-eyed qualities should be imbibed along with the virus, the human race might be much the gainer.

Have you a piece of land so poor that even weeds will not thrive upon it? That is precisely the land upon which to try the virtue of chemical manures. If upon such land by their use a crop of grain may be raised, then the value of chemical manures is at once established. That is, it would thus be proven that concentrated fertilizers may supply the food upon which crops feed. This test has often been made. We know of one instance in New Jersey where one of two plots of infertile land received a dressing of fertilizers, the other received none. Upon the latter, the corn grew to the hight of but a few inches. Upon the former at the rate of over 50 bushels of shelled corn per acre were harvested.

Quite a correspondence has of late been going on between the Rural New-Yorker and several stockmen of the country. They tell us that they cannot afford to pay our advertising rates, being higher than those of other agricultural journals. It would appear that stockmen are favored with *special* rates by many, if not by all, of the journals which they patronize, and with editorial notices *ad libitum*. We beg to state that to change our rates in their favor, would be a discrimination extremely unjust to our other advertising patrons, and that if they can not afford to advertise in the columns of the Rural New-Yorker upon *our* terms, we cannot afford to accept their advertisements upon *their* terms. And so let them, as we shall try to do, rest in peace.

It is our belief that if every intelligent farmer, gardener or horticulturist—everybody indeed that is interested in plant life—could know of the yearly contents of the Rural New Yorker; could know how earnestly it strives to promote their interests, that they would become subscribers. The hardest thing to drive into the public head is that anybody is unselfishly working for its interests. We could print probably not less than one thousand testimonials from good people that the plant and seed distributions of the Rural New-Yorker during the past three years have been worth more to them than the subscription price of the paper, and we are constantly receiving assurances from the best men of our country that the Rural New-Yorker itself is invaluable.

How many farmers and farmerines have good teeth? Prof. Hartshorn, of Germantown, Pa., recently stated in a lecture that the reason why the teeth of Americans decay sooner than do those of the people of other nations, is due to their habit of *rapid eating*. It is no new doctrine, but one that requires frequent repetition. Hasty eating induces dyspepsia, and nobody with an unsound stomach can long have sound teeth. The stomach is the body's best friend in the long run, and whoever obliges it to do the work of the teeth commits suicide in just that proportion. In the hurry of farm work, bear in mind that "less haste and more speed" applies directly to the mastication of your food. If you can't eat slowly, and chew your food thoroughly, at least train the youngsters about your table to do so, under the penalty of being toothless middle-aged men and women.

HUMANITY TO LIVE STOCK IN TRANSIT.

Attention has lately been called in the British House of Commons to the sufferings of American imported live stock on the voyage across the Atlantic, and from the remarks of the Secretary of the Privy Council it appears the attention of that body had been several times called to the matter, and that it had been for some time in communication with the Board of Trade with a view of devising measures for lessening the sufferings of animals in transit. Humanity and self-interest alike demand that the sufferings of exported animals both on their way to the sea-board and across the Atlantic should be reduced to a minimum, and the latter consideration is likely soon to enforce the dictates of the former. In this country the Humane Society's efforts will probably soon place upon our railroads cars effectually designed to transport live stock with a minimum of inconvenience; for out of the 420 models its offer of a premium has elicited, one at least must prove satisfactory, while there seems every disposition on the part of our Legislatures to compel the railroad corporations to pay regard to humanity in this connection. In England reports to the Privy Council from the insurance agencies show that the amount of suffering endured by stock in transit has been much lessened by recent devices, and the Privy Council's efforts are likely to make still further improvements in this direction. Already most of the animals are landed in excellent condition; while the reports of our exports of live stock in this week's Agricultural News column show a remarkably small percentage of fatality among our shipments last year. Small as this is, however, it is considerably greater than that incurred by a Canadian Steamship Company which has sent to this office a statement of its business in that line for the last fifteen months. From this it appears that during this time it shipped 16,005 head of cattle, and landed 15,852 alive, while out of 30,465 sheep shipped, it lost only 725.

A DANGER TO OUR HOG PRODUCTS.

Last week the importation of American hog products into France was prohibited on the ground that their use would be dangerous to the people owing to several cases of the terribly fatal malady, trichinosis, having arisen from the eating of American pork. There are now six European countries which refuse to allow the importations of hog products from this country for the same reason: France, Spain, Portugal, Italy, Greece and Switzerland. In reply to a question in the French Assembly, however, the Minister of Agriculture said that the prohibition in France would probably be short-lived, as it would be removed so soon as adequate measures for inspecting American pork had been provided in the various markets throughout the country. Advices from Liverpool last Friday state that dealings in our hog products in the British markets had become completely paralyzed owing to a report made by the English consul at Philadelphia to the effect that hog cholera was extremely disastrous just now in Ohio. The President of the Board of Trade of this city telegraphed to Commissioner Le Duc an inquiry as to the truth of this statement, on Saturday, and the latter at once replied that according to the information at his Department, hogs in Ohio and, indeed, throughout the whole country, were exceptionally free from disease at present.

The widespread foreign opposition to the use of hog products from this country, together with the weakening of the "corner" lately formed at Chicago in certain articles of the trade, must cause at least a temporary depression in prices everywhere. This is highly deplorable, and measures should be promptly adopted to remove the causes as early as possible. The value of our annual exports of bacon, hams and lard is next to that of breadstuffs and cotton, and it has been stated on excellent authority that unless prompt steps are taken to suppress hog cholera and other contagious diseases among our swine, the annual loss to the country will soon reach the enormous sum of $80,000,000. Until these maladies shall have been extirpated a rigid system of official inspection should be established at all hog packing institutions to guard against the employment of meat or lard from unsound animals. It is not for a moment to be tolerated that the health of the public, at home and abroad, is to be endangered and so vast an industry subjected to derangement and loss, in order that a few unscrupulous dealers might grow rich by the sale of plague-spreading products.

BREVITIES.

Dr. Armitage in his sermon last Sunday maintained that there is much more goodness and beauty of spirit among men than is generally known.

Attention is called to the advertisement in our columns "Wanted—A Manager." We know the farm, the proprietor, and may say that we shall congratulate the successful applicant.

All subscriptions received after this date, will be placed on our lists to receive the Rural New-Yorker one year, counting from the date when the subscription is received. We have no back numbers.

We commend to all who are interested in such matters, the carefully prepared articles on the Army-worm by Prof. Cyrus Thomas. The first appeared in these columns in the issue of January 29. The concluding article will speak of remedial measures.

Horticultural people must always be crazy over something or other. At present, there is an evident disposition to make the object Roses. Roses are so really beautiful, they have so many endearing ways and looks, that one is excusable for making them a hobby and for riding it hard.

We are sad to know that our friends of the A. A. have moved away—up town somewhere, where rents are cheaper. They rarely or never called upon us, it is true; but then they read our signs and possibly looked in upon us through the windows, thus showing a kind of interest in our progress.

Cheese from lard in New York and butter from lard in Chicago elevate the hog to a rivalry with the cow in her own peculiar line. A large factory in this city is, we are told, engaged in the manufacture of cheese from lard. The latter is reported to be peculiarly adapted to the production of *brie* and similar cheeses. Orders for the new fraud are said to be miles ahead of the supply, and the stuff is reported to be undistinguishable from genuine cheese.

As we anticipated, the forty-sixth Congress came to its end without having, even in its last moments, repented of its sin in failing to pass a bill for the suppression of pleuro-pneumonia and other diseases among the live stock of the country. Well, in view of their gross neglect in this and not a few other matters, we trust that such of the members as are politically dead, may remain so, and that such as are still able to "talk" in the forty-seventh Congress may die politically on the first opportunity unless they shall show by their works and votes that they have heartily repented of their past disregard of the interests of agriculture.

A bill has been introduced into the New York Legislature to punish the owners of all hotels, restaurants and boarding-houses that use or place on the table oleomargarine or any of the similar concoctions, unless they display in a prominent place a card on which a statement is made in large letters, that the stuff is served in that establishment. The enforcement of this measure would be just alike to the guests of such places and to the producers of good genuine butter; but, happily for boarding-house landladies, and, alas! for their victims, we are sadly afraid that justice in this case will once more fail.

It is pleasant to see that, better late than never, some of our contemporaries are doing justice to our friend, Winning-Billerica Bailey. It has been a matter of exceeding surprise to us that he has hitherto been permitted by respected contemporaries to say his say without reproach. We do not know this man—do not want to know him. He has never harmed us excepting by appropriating our cut of Blount's Corn and calling it his "Ensilage Corn." We have condemned him so as to protect our readers against a bold-faced man whose statements are not worthy of trust. Ensilage will get along better when it gets rid of its "Winning" advocate.

The Eastern Pennsylvania Experimental Farm Club has arraigned the State Agricultural College in Center County, for inefficiency, and asked the Legislature to suspend the usual annual appropriation. We heartily commend the action of every agricultural association that keeps a watchful eye on the conduct of the agricultural college in its State, and holds it to strict accountability for failing to fulfil the object of its establishment. This is a duty which, it is much to be feared, has hitherto been sadly neglected by farmers' clubs and societies, and we hail this action of the Eastern Pennsylvania Farmers' Club as a hopeful sign of amendment.

The University of Pennsylvania has been indulging in the common-place clap-trap of endowing Mr. Garfield with a tail to his name in the shape of LL. D. Harvard pronounced a similar benediction upon the name of U. S. Grant, and the General caught at the bait and sent one of his sons there. Whether the University of Pennsylvania will be equally fortunate as regards the young Garfields is yet to be seen. Our President is worthy of all honor; but when a man has climbed so high in public esteem and public honor, there is not a college in the land that can add to the glory of his name by any title whatever. As names reach the hight of true grandeur, they shed all such quill feathers as titles.

The White Grub (larva of the May Beetle or June Bug)—Lachnosterna Fusca—is the strawberry's worst insect enemy. Many remedies have been recommended, tried and found wanting. Those applications strong enough to kill the grub have been found to injure or to kill the plant also. Salt, at the rate of three to five bushels per acre, has been recommended, but the efficaciousness of the possible remedy is not as yet known. A friend suggested to us a while ago that he believed whale-oil soap, cut into little pieces and placed about each plant or strewn over the surface of the bed, might kill or drive them away. He thought that rains would gradually dissolve the pieces and the earth soon become impregnated with the solution which would prove insufferable to the grub.

The happiest person in the country on the 4th of March, 1881, undoubtedly was the venerable mother of James A. Garfield; and she had the highest right to be. Left a widow with her small children, who, with herself, were quite dependent upon her own exertions for support, she kept her little flock together, and demonstrated, as have many other women also, "what a woman can do;" And now her boy is President of the United States of America. All honor to the good mother! Remarkable men almost never have remarkable sons, but a boy that amounts to something "uncommon" almost invariably has been blessed with a superior mother. So far as the human race goes, the mother is the prime factor in excellence.

The Colorado Cattle Growers' Association, in view of the existence of contagious pleuro-pneumonia in some of the Atlantic States, and the fact that some 40,000 calves were lately exported from the infected States to points west of Chicago as far as Nebraska, recently passed a series of resolutions deprecating such traffic as perilous to the herds on the Western plains, and petitioned the Members of Congress from that State to take immediate steps to procure national legislation to check the spread of the disease to uninfected quarters and to secure its suppression where it has already obtained a foothold. Although stockmen and farmers all over the country have made their voices heard in no doubtful tones on this matter, Congress has hitherto been shamefully negligent in passing the needed legislation. This disregard of their interests, the farmers of the country should keep in mind when their present *mis*-representatives shall come before them for re-election.

The beet-sugar factory at Franklin, Mass., according to a late telegram, has failed to the financial loss of many of the neighboring farmers to whom the concern owed $11 220 for beets, out of a total indebtedness of $25,000. The factory was owned by a joint-stock company which made big promises; but failed early. It imported machinery from Germany costing, it is said, five times what was expected; and as this will now be sold for a "song," another party intending to start in the business would have a good chance of beginning with an important point in his favor by buying the apparatus cheaply. We have read a great deal about the practicability of making beet-sugar profitably in this country; but, much as we would like that an industry which would so greatly help our farmers, could be remuneratively conducted among us, we have not heard of a single instance in which this has been done long enough to prove its possibility under present conditions. The right kind of seeds, the right kind of soil, the right sort of culture, the right sort of handling, skill in the farmers and skill in the manufacturers, are all indispensable, in addition to a thoroughly economical and efficient business management. In the present state of the industry here the necessary skill is wanting; and in the joint-stock companies that have hitherto chiefly embarked in the business, it is highly doubtful whether economy and efficiency have formed sufficiently pronounced features.

Entomological.

THE ARMY WORM—NO. 2.

PROFESSOR CYRUS THOMAS.

SINCE writing the preceding article I have had the good fortune to obtain copies of the papers by Messrs. Shurtleff and Kirkpatrick on this insect; that of the former written in 1862 and that of the latter in 1861.

In reference to the question as to whether it is single or double-brooded, Mr. Shurtleff says, "I have not sufficient data to decide between the two opinions; but it seems that Mr. Walsh is right." Mr. Kirkpatrick says, "It is not positively known how many broods of Army worms there are in a year, but there is no doubt that there are at least two, for the moths hatched in Midsummer deposit their eggs immediately after, and the last brood must remain either in the caterpillar or pupa state through the Winter."

The fact that there are two broods in the latitude of St. Louis being now admitted by all parties, the further question arises, are there not usually three? In the article alluded to, Professor Riley expresses the belief that there are. (Am. Ent., Aug., 1880, p. 184.) I am still of the opinion that there are not more than two in Southern Illinois or any place north of that latitude, and will give here my reasons for this belief.

As these involve two other points—the term of individual life and the method of hibernation—I first discuss these briefly, so far as they relate to the latitude designated. I limit the discussion to the latitude named because there are reasons for believing the habits of the species in reference to hibernation vary in different latitudes.

Term of Life.

Although the entire life of the individual includes all the time that elapses from the moment the egg is deposited until the moth produced therefrom dies; yet in calculating the succession of generations we have occasion to use only the time which elapses from the moment the egg is deposited until the resulting moth deposits her eggs. In order to arrive at a correct conclusion on this point it is necessary to ascertain what is the average length of the different stages, viz., of the egg from the time it is deposited until it hatches; of the larva state; of the pupa state, and of the moth from the time it emerges from the chrysalis until its eggs are deposited.

Where positive data ascertained by experiments can be found, it is undoubtedly best to use them at least as a basis, but the growth and development of insects in confinement where there is a uniform temperature, and where an abundance of food is always at hand, can seldom, if ever, be accepted as exactly the same as in a state of nature.

Professor Riley has shown by his experiments, made in 1876, that the moths commence laying, in confinement, in about two weeks after issuing from the chrysalis. As it is almost certain that in their natural condition the time would be extended rather than shortened, we assume 10 days in order to have a definite time to use in our calculations. In process of the same experiments Professor Riley found that the eggs, in a uniform temperature of 75 deg., hatched in about 10 days. It is probable, therefore, that in their natural condition the time required is about two weeks. But this assumption is not gratuitous, as will presently be shown.

He also found that by feeding the worms in confinement at an average temperature of about 80 deg., some passed through this state in 15 or 16 days, and this forms in part the basis on which he founds his present theory as to the number of broods. But all the evidence I have been able to obtain in reference to this point shows that in their natural condition they usually continue about a month in this state. My experiments in 1861, in the natural temperature of the locality, gave, as nearly as I could estimate the age of the worms when first taken, 28 days as the shortest period. Mr. Walsh, who also reared the species from the larval state, gives "from four to five weeks" as the length of this stage; Dr. Packard allows one month. Dr. Fitch says they continue to feed and travel about three weeks from the time they are discovered, which he says is when they are about one-third grown. The investigations, therefore, of these parties agree in fixing the average length of time they exist in the larval state at not less than one month.

The individuals of the Spring brood, as shown by repeated experiments, remain in the pupa state from two to three weeks. My experiments gave an average of seventeen or eighteen days; Dr Fitch says, "nearly three weeks"; Dr. Packard, and Prof. Riley say, "from two to three weeks"; Mr. Walsh's specimens remained in this state fifteen days; Shurtleff's, seventeen, and Kirkpatrick's, fourteen days. I will assume seventeen days as the average. The term of existence of the individual from the time the egg is deposited until the resulting moth lays her eggs is, according to these conclusions, about 77 days—eggs, 14-|-, larva, 30-|-, pupa, 17-|-, moth, 16,—total, 77 days.

In order to test the correctness of this conclusion let us see how nearly it agrees with the appearance and disappearance of the moths and worms. For this purpose I give here a short list of dates of captures of moths and appearances of the worms; I have many more, but only give such as we need for present purposes.

Dates of Captures of the Moth.

Illinois. Jackson County.

April 2, 6, 7, 8, 9, 10 (1879); 13 (1878); 2, 3, 4, 13, 15 21, 25 (1880).

June 20 (day of exit from pupa in confinement) 21, 22, 23 (observed emerging from the ground), 29 (1861 and 1875).

Oct. 18, 23 (1879).

Nov. 10 (1879). (Thomas & French).

Cook County.

Mr. Worthington, who has furnished me with quite a list of dates, gives April 3, 10, 11, 16, etc., as the earliest captures.

Galena, Jo Davies County,

Dr. Bean, who failed to find the early moths, notes their appearance in considerable numbers, June 24, 29 etc.

Normal, McLean County.

May 24, "two specimens"—"June 23, several"—"From July 15 to August 18, very common each year." (Forbes.)

Missouri, St. Louis.

"Early part of April," "Middle of April," "June to October." "Early in August," "In September," "October 9th." (Riley.)

New York, Schenectady.

July 7, 21.

August 7, 13, 16 and continues up to October 6 (1875.) (Lintner.)

Albany.

Latter part of May—from a single pupa found. (Meske.)

Notices of Larvæ.

Illinois, Jackson County.

First seen in 1861 about April 29th, continued to appear until May 15 and finally disappeared about June 10th. Latter half of September, 1874, marching. Latter part of May to first week in June, 1875. June 4 (1877) all the first larvæ below the dirt to pupate. (Thomas & French.)

Missouri, St. Louis.

"Early part of May," "During the latter part of April, and throughout the month of May," "Early in June, mowing down meadows." "All through the month of August, and a few full-grown individuals as late as the 23d of September." (Riley.)

These will answer for our present purpose.

Taking the Jackson County list—where the April and June captures, as I know from actual observation, represent the first appearance of the moth in each case—we find that the length of time that elapsed between the first in April (2nd) to the first in June (20th) to be 78 days.

Taking the first of Worthington's list, April 3, and the first of Bean's, June 24, we obtain 82 days.

Dr. Lintner commenced collecting July 7th and continued until October 25th. Up to August 7th, no Army-worm moths were seen except on the evenings of July 7th and 21st. From the time they began to reappear in August, they were absent no evening until he had passed October 6th, after which no more were seen. It is, therefore, more than probable that the July captures were the last of the preceding brood. Counting them from the last of the first brood—July 21st to the last of the second—October 6, we have just 77 days.

If we suppose Prof. Forbes's capture of May 24, to be the ending of the Spring moths, as was doubtless the case; and August 18th the closing of the Summer brood, we have 86 days as the average term of life.

"Early in April" and "in June," as given by Prof. Riley, corresponds in general terms with the estimate given. The appearance and disappearance of the larvæ correspond very well with this estimate, or if they show a difference it is in the direction of a longer term than supposed.

The life period of the second brood, as calculated by the meager data we have at hand, appears to be considerably longer than the estimate given. The first brood of worms have usually disappeared in this county from the 4th to the 10th of June, and those of the Fall brood seen when full-grown were observed between the 15th and 30th of September. This corresponds almost exactly with Prof. Riley's observations of the worms as above quoted.

Counting from June 10th to September 20th, we have one hundred and two days.

It is not possible that there could have been two broods in this period, as the time is too short, and, moreover, there is an entire lack of evidence to sustain such a view.

We may, therefore, assume as pretty well established that the life of the individual of the Spring brood, from the time the egg is deposited until the resulting moth lays her eggs, lasts not less than 77 days under ordinary circumstances, with the probability that it may be extended rather than shortened.

Before concluding our argument in reference to the number of broods in this latitude, it is necessary to allude to

The Hibernation.

What is here said on this point is to be understood as applying only to this latitude, as there are reasons to believe the method of hibernating varies in different latitudes. The worms when first seen in this county in 1861, in the latter part of April, as shown by my own observations and those of Col. B. Wiley, were quite young, evidently not more than one week old. The time of appearance and disappearance of the worms in the Spring, as shown by the observations of Professors Riley and French and myself, correspond with this. The capture of moths from the 2d to the 25th of April in different years, also agrees so exactly with the time the worms are first seen, that we are forced to conclude the eggs were deposited in the Spring. Moreover, the direct observations of Prof. Riley are sufficient to confirm us in this opinion if the other facts had left us in doubt.

It follows, therefore, that they must have hibernated as chrysalides or moths. Our reason for believing that they do not pass the Winter in the moth state are, *first*, those caught early in April are fresh specimens showing no signs of having lived in this state any considerable length of time; *second*, that so far not a single specimen has been taken in this section in the Winter, although we often have during this season warm and pleasant days when other species are captured. That a few of the second brood do reach the moth state in the Fall, is true, as the occasional captures in October and November show. But such captures are rare.

In an article published in the Prairie Farmer, June 20, 1861, I expressed my belief that it passes the Winter in the pupa state. All the data obtained since that time tend to confirm this view so far as this latitude is concerned.

Mr. Walsh held then and until his death that the eggs were deposited in the Summer and remained over until the following Spring.

Prof. Riley in his second report adopted Mr. Walsh's theory, but gave it as his opinion that "exceptional individuals occur perhaps one in a hundred, but demonstrably not as many as one in twenty, which lie in the chrysalis state all through the Winter." In his eighth report he expresses the belief that the great bulk of them hibernate in the pupa and moth states, the proportion of the former increasing northward."

In his ninth report he reaffirms this view. In 1880 in the article already quoted he gives as his belief that "by far the more common mode of hibernating is in the larval state."

Dr. Fitch does not express his belief on this point, but I infer from a careful study of his article that he believed it passed the Winter in the moth or pupa state. For, as Shurtleff remarks "his theory will do very well if they are found to lay their eggs in the Spring."

Kirkpatrick was of the opinion that they passed the Winter "either in the caterpillar or pupa State.

Prof. Comstock says, we can now safely state that it hibernates both in the moth and chrysalis states, the former being more common in the southern part of the country, and the latter in the northern regions."

Dr. Bean, of Galena, Ill., in a letter communicating a list of captures, incidentally remarks: "Dimly remember captures (think 1878) indicating probable hibernation in pupa state for this locality—but can't be sure."

Mr. C. E. Worthington, of Chicago, writes me as follows: "It doubtless passes the Winter in all stages; in fact, I have had eggs of Fall brood hatch in Spring and taken worn specimens in March, and have pupæ at the same time; while I have no doubt but the brood emerging in June passes the Winter in the larval stage. This brood, i. e., June and October, seems the only regular brood of the season."

Difference in latitude and climate will account in part for these different views, but it is evident that, so far as the more northern latitudes are concerned, this question is involved in very great doubt.

So far as this section is concerned, we may consider it settled that they hibernate in the pupa state; perhaps a few of the moths that come out in the Fall pass safely through the Winter, but so far we have no good reason to believe this.

As additional evidence in favor of this view I present the following, based upon the estimated term of life heretofore given:—

Assuming June 25 as the average time the first moths of the Spring brood of worms make their exit from the pupæ, and counting forward 77 days, brings us to the 10th of September, when the moths of the second brood will begin to appear. If they should deposit eggs, these could not hatch before the 10th of October, and the worms would not be half-grown before the 1st of November. Moreover, these would only be the advance guard of the brood. It would require the entire month of November to bring the mass of the brood to half growth, for we can hardly suppose they pass the Winter when younger.

But another almost insuperable objection to the idea that they pass the Winter (here) in the larva state is, that no armies of half-grown worms were ever observed in the meadows or elsewhere in October or November preceding their appearance the following April and May of the great Army-worm years. And, as before stated, when they did appear in April and May, they were, when first seen, not quarter-grown.

Literary Miscellany.

DOT MAID MID HAZEL HAIR.

DALK not to me baud maidene rare,
Mit shkin of bearly hue—
Dere vasn'd any kin combare
Mit von I hafe in view.

She'e gendle like der soft gayselle,
Her face was awful fair—
She has dwo aupurn eyes of plue,
Und hazel vas her hair.

Her woice vas rich like anyding,
Her moud vas like der rose,
Her sheeks—dem plooms just like a beach
Und dimpled vas her nose.

Her hands und feed vash shmall und need,
Und ven dot maiden sings,
Dem leedle birds den glose deir eyes
Und flops deir leetle vings.

I'm going to dook dot leedle maid
Some day to been my vife,
Und make her happy like I kin
Der balance of her life.

Und ven ve'm settled down for goot,
I'll show you something rare—
Dwo shmiling aupurn eyes of plue
Und shblended hazel hair.

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

(Continued from page 137)

CHAPTER V.

"We call them phillegomotors," said my friend "from the name of the gas by which they are upborne and propelled."

He then went on and gave me a description of these transit machines, in language which was simple enough, no doubt, for the understanding of a child. But I was like one who, awakening from the sleep of a generation, was receiving his first ideas of the steam engine or the magnetic telegraph. The general notion, however, which I received of the phillegomotor was this:—

A gas called phillego had been discovered which possessed remarkable properties as to lightness and elasticity. This could be generated or resolved at will, instantaneously, and to any desired extent, by chemical action in an apparatus which was attached to every car. The great bag, which I have remarked formed the roof of these cars, was the receptacle for this gas. At starting out enough of the gas was generated to just bear up the car. As passengers got in the quantity was increased and when they got out it was diminished, so that an exact equilibrium was preserved between the upward tendency of the gas and the force of gravity. The car having thus in effect no weight, it required but little force to propel it. This was accomplished by this same gas, which caused a disk or wheel, constructed on the principle of the propellor, to revolve with incredible velocity, thus acting upon the air as the propellor of the steamboat acts upon the water. The connection between the car and the track was by small wheels above and a clamp with a projection which fitted into the groove or under side, which I have spoken of as being smooth and bright as polished steel. The car was thus held in its place on the track against the force of wind, and the lifting power of the phillego, if by accident it should preponderate over the force of gravity. Each car was, of course, supplied with brakes and the most complete apparatus for regulating its speed, and in case of accident it could be instantly disconnected from the track, elevated above the house-tops and guided through the air till its speed could be diminished and it could descend in safety.

The cars for long distance passengers ran for a mile without stopping and then descended to the sidewalk, in the same manner those of the other line at every cross-street. I was so taken up with my friend's description of these phillegomotors, and so absorbed in watching them and following my friend's description of their mechanical appliances, that the hundred other wonderful things which came within the line of my observation made but a passing impression on my mind.

CHAPTER VI.

A LOOK AT THE CITY DURING BUSINESS HOURS.

A RIDE of half an hour brought us to my friend's place of business. He was at the head of a large cloth manufactory, which had mills in a neighboring township, and a store for the disposal of goods in the city. As it was the custom of the country to devote only the forenoon to business, it was necessary for business men to give their whole attention to their various occupations during the few hours which were devoted to them. My friend, therefore, excused himself to me till after business hours, but exacted a promise from me to go with him then to his house.

I wandered through the establishment for a while watching the throng of customers making their purchases, and the operations of unpacking and arranging goods just received, and the packing of those which had been sold. I wondered at the quickness and dexterity with which every operation was performed. Every employee seemed to know exactly what his duties were, and to be thoroughly competent to perform them. Great boxes of goods were run up on elevators to the floor appropriated to their class, and borne away on trucks in the hands of stalwart porters to the exact spot where they were needed, and quickly unpacked and disposed of without the least fuss, or uncertainty of movement. In the same manner goods which had been sold were gathered up as soon as customers had completed their purchases, and borne away to the packing-room, where they were boxed and marked almost before the customer had got out of the store.

Such excellent system prevailed that there was little ordering or running about asking for instructions but every one connected with the house seemed to have his duties so clearly defined, to understand them so thoroughly, and to be disposed to perform them so promptly that no controling or directing mind was required.

In making sales, also, the best understanding seemed to exist between buyer and seller. There was no cheapening, or higgling over prices, or examining of goods with the view of discovering something in them that was not as represented. Indeed, the quickness, and the apparently artless superficial manner with which the buyer bought surprised me no less than the straightforward and guileless manner with which the seller sold. Every bill of goods which I saw sold was paid for on the spot, and every order which was sent in and by far the greater portion of the business of the house was done through orders—was accompanied with the money, or its equivalent. And here I may mention another thing which greatly surprised me, namely: The careless manner in which money was handled. The cashier piled the coin which he received upon his desk before him, and placed the paper money under a weight that it might not be brushed off by the passer-by, or blown away by the wind. That any one of the throng of strangers passing in and out should snatch it or that any office boy or porter should help himself to some of it when the cashier's eyes were withdrawn, seemed to be a matter which they were at no pains whatever to guard against. Though several thousand dollars might be collected during the hours of business, it all lay upon the desk, like any article of little value till the cashier made up his accounts.

Having satisfied my curiosity as to the business methods of the house, I wandered out on the street to look about me till the close of my friend's business hours. The sidewalks were alive with people, moving along without the hurry and hustle which characterize the business men in the great cities of my own country, but with a business-like energy in every movement which spoke strongly of promptness and efficiency in every transaction.

The wonderful phillegomotors were shooting by constantly, dropping to the pavement, rising and shooting off again with an apparent impatience of delay which seemed to imply that, like the merchants, their harvest time was the hours of the forenoon. It was some time before I could witness the passage of one of these flying machines with a sense of security. Instinctively I moved to the

inner part of the sidewalk when one approached and my heart seemed to leap up into my throat when they descended to the sidewalk, from the feeling that a frightful accident was impending. But gradually my sense of danger grew less as I became more familiar with them, and nothing occurred to justify my fears, till I finally grew bold enough to take a ride in one. But of this in its place.

Great trucks, loaded with merchandise were bowling along the pavement, propelled by that wonderful genius of the country, phillego. Each was guided and controlled by a single man, who sat upon a platform in front of the truck, and with a foot-lever and two hand-levers managed the apparatus for producing motion, which was situated directly under him, and connected with the forward wheels. It was wonderful to see how easily and completely the driver controlled his truck. By the simple pressure of his foot he could start it off at a terrible speed, and by withdrawing the pressure he could reduce its speed to the barest movement. By the two hand-levers he was able to guide it to the right or left at will, or turn it about in a space but little more than its length. I stopped many times to look at these trucks being backed into the sidewalk for the delivery of goods; for it was really surprising to see how quickly and accurately this movement could be performed. The best trained horses in my country were nothing in comparison.

Express wagons and other business vehicles were propelled in the same manner. In fact, the horse as a beast of burden was entirely superseded in this country by that most useful and powerful slave of this advanced people, phillego. Having been elevated in the scale of being in a corresponding degree with his masters, his docility and intelligence caused him to be treated as a pet, and no dog ever displayed a greater affection for his master, or willingness to do his bidding than the horses of this country. Hence it was that so much confidence was placed in their fidelity and intelligence that neither bit nor rein was ever used to guide or control them. A single word would urge them on, or cause them to slacken their speed, or perform every required movement with the utmost safety.

It was really quite frightful to me to see these noble animals careering along without any apparent control among the various phillego vehicles, with which the street was crowded, and winding in and out among the pillars of the elevated railways. But they showed an intelligence little less than human in managing the vehicle which they drew. Their notions of space and distance in relation to it was most accurate, so that they never attempted to go where there was not room for it, and they always kept off far enough from any object with which it might collide, to insure safety.

There was another thing about these horses which excited my surprise, and that was the want of clatter with which they traveled. Their feet came down with a thud upon the pavement as though their shoes were made of rubber instead of steel. I afterward found that they were made of a substance which possessed some of the properties of rubber, but which was greatly superior to it in toughness and durability. Every vehicle, indeed, had its wheels hooped with this material, so that the noise of the street was a dull low rumble, instead of the clank and clatter to which I had been accustomed in the great cities of my own land.

Another thing which greatly contributed to lessen the noise of the street was the wonderful smoothness of the pavement. If the city had been chiseled out of some great marble plain, its streets could not have presented a more unbroken appearance. Not a single joint could I discover in the material of the pavement, though I carefully observed it for several blocks. Even between the side-walk and the street, though there was quite a depression to form a gutter, nothing like a joint was discernible. Indeed, the very houses seemed to be a continuation of the material of the street, without a joint from base to roof. Stoops, pillars, porches, balconies, even the very window frames, to the grooves for the sash, all had the appearance of being chiseled out of the solid rock. And such wondrous sculpture I had never seen attempted in any material as was displayed in the external ornamentation of many of the houses.

The material of the street and side-walk was of a greenish cast, and somewhat coarse in texture. That of the houses was very fine grained, hard, and susceptible of a high polish, so that in walking along the street one's image, reflected from the houses, accompanied him as a continual presence.

This people possessed the art of giving to the material of their houses any coloring which they desired, so that it seemed to be a part of their nature. Thus, some of the houses were beautifully mottled like serpentine. Others had the various and fantastic coloring of agate. Others were red like jasper, and others had the purple hue of amethyst. In short, all the most beautiful minerals were represented in the material of the houses. No two houses adjoining each other being alike, there was yet a tasteful regard paid to the harmony of their coloring which greatly lightened the effect which individually, they were so well calculated to produce.

The streets of the Golden City, it appeared to me, could not present a more beautiful appearance than those of Good-will-to-Men. Apparently located on a vast level plain of marble, from which its hundred feet wide streets were chiseled with mathematical precision, and from which its buildings rose to their tolliest domes and pinnacles as one unbroken piece of polished marble, variegated and beautified by an art which rivaled nature. With one continuous park of majestic elms, shading exquisite statuary, delightful bowers and sparkling fountains, running through the centre of every street, with the pavement laved daily by the water of the fountains, so that it was as pure and clean as the floors of the dwellings. With delightful parks at frequent intervals throughout the city, where nature fostered by art presented one continual feast of pleasure for human enjoyment. With a people in whose physically perfect bodies a mind of unspotted purity, goodness and commanding intelligence found a habitation. Surely, thought I, the Golden City itself could furnish nothing more of external beauty to delight the soul of man.

Musing thus, I wandered on along the crowded thoroughfare, indifferent to the gaze of those I met; for my soul was so elevated by the beauty and excellence of all I saw that I quite lost consciousness of my great inferiority to this noble people; and this inferiority I was compelled to believe was the source of the curious attention with which I was regarded.

To be continued.

BRIC-A-BRAC.

He aster her if she'd marry him,
He said "I canna tell,
But if you'll larkspur round awhile,
And pansy out right well,
I'll be your lady-in-the-mist,
Your hearts-ease and your pet,
And should fortune smile on you,
I'll mari-*gold*, you bet."

—Modern Muse.

At dinner she had a doctor on either hand, one of whom remarked that they were well served, since they had a duck between them. "Yes," she broke in—her wit is of that sort that comes in flashes—"and I am between two quacks." Then silence fell.

A blushing maiden of forty Summers entered the town clerk's office in Wheeling, West Virginia, recently, and asked in a voice trembling with agitation, for a license. The clerk took down the name and address of the visitor, "Name and address of the other party?" asked the clerk. "Faithful, and he lives with me," replied the fair one. The clerk looked at her for a moment, and blushingly completed the filling of the document which he handed to the lady. He was astonished at her conduct. She gave one glance at the license, hoarsely whispered "monster:" and swept majestically out of the office. The clerk had presented her with a marriage license, when it was a dog license she wanted.

For Women.

CONDUCTED BY MISS RAY CLARK.

MORN AND EVE.

I see her at my cottage door,
A little child, with sweet blue eyes,
Where linger yet, like morning's mist,
The look she brought from paradise.

And by her side an old man sits,
And dreams of days long since gone by,
While overhead a robin sings,
And sunset glories light the sky.

Along the paths her feet have trod,
Hopes fairest, brightest blossoms spring;
She hears no mournful undertone,
But sweet and clear life's joy bells ring,

She laughs to hear the joyous song
The sweet-voiced robin gayly trills,
But he, with faded, wistful eyes,
Watches the sunset o'er the hills,

And then, soft sighing, whispers low,
"My day, like this, draws near its close,
And night comes slowly stealing on,
The night which brings me sweet repose."

OUR TRAVELS.

VELENA.

The "gude man" and I had concluded to view the metropolis; visit the Quaker city and see Washington. A little fixing up being quite essential, a dressmaker was employed; all would have gone well had not said woman stopped off and got married. However, the dress was at last finished and the feet shod; then the head came in for its due attention. The pony and phaeton were brought around and we rode to a millinery establishment; entering, I said to the proprietor that I desired a hat, hood, bonnet or cap, whatever might be the style, becoming to me and suitable for traveling. Then came the trial: bonnets too young, too old, too flaring, too close, too sombre or too gay; all very fine and very becoming, but not to me—were brought forth. At last a compromise was affected; the outside black, face old gold and ruby—two colors never worn by the writer before and much less becoming than those she had worn, and we rode home through a drizzling rain. The 2nd day of November came. After reminding the Professor of his rights, saying to a prominent man who had come all the way from Washington to vote, "do not forget to vote before the polls close," and asking a young man who was to vote for the first time if he had forgotten to put in his vote, we took a drawing-room car (cost, extra, three dollars and fifty cents) and when the wheels went round, the Professor, David and I were traveling eastward. We rode through valleys, by hills and past small towns until Utica, with its Insane Asylum and woolen mills was reached. Here, an emigrant train had unpeopled itself; its inmates with their queer dresses and queer baskets were sunning themselves, deliberately walking to and fro or filling their lunch baskets at a neighboring eating house. They were men women, and children from Germany, going to the far West.

Upon leaving Utica, we were carried along by the iron steed past a romantic place where a winding stream among the rocks sped on its way most gracefully. Looking back to get a last glimpse of this lovely spot, we were carried out of its sight all too soon; on and on the locomotive hurried, with its freight of humanity following close in its rear.

Having arrived at Albany, and seeing that our niece had her washing on the line, we concluded not to stop; for washing day is not a good day to call on one's friends. In the distance we got a glimpse of the State Capitol, which has already cost nearly as much as the National, but is not to be compared to it in architectural design or artistic adornment and magnificence. To some, however, the one at Albany may seem all excellent, but I observe that one's comparative judgment depends upon what opportunities they have already had for observation.

On and on we went, rushing by the school where Cadet Whittaker did or did not snip off his ears. With the stars twinkling overhead and the lights beneath, with bonfires occasionally sending up lurid flames, the hurrahing of victorious politicians, shouting of car-drivers and hackmen, we reached the metropolis.

CHILDREN'S FUNNY BOOKS.

A heart must be very cold which does not feel a responsive thrill as it listens to the merry laugh of children over the treasures of a Christmas tree. But do we ever think that it is really an important matter what they laugh about? Books and pictures form a large share of the gifts at the holiday season. There is a class gotten up for the little ones, in gaudy colors, with superb bindings, which contain caricatures as senseless as they are coarse, while the wit in them is only of the order to be found in the comic valentine, or on the boards of the negro minstrels.

Are they of the kind to elevate our children's tastes or refine their characters? Is not the tendency the other way; do not children drink in this coarseness as they would water, and fill their brains with the clownish, vulgar trash, to the exclusion of anything better? What a pity it is that children in lovely homes, surrounded by all that should tend to elevate and purify their nature, should be so degraded by the careless kindness of friends, who, to amuse them for a moment, do so seriously mar their moral and intellectual nature.

There is an abundance of rare, delicious fun, of sweet tender sentiment, in books, that is all right, which children enjoy quite as well, without going over to the enemy's ground and plucking those poisoned sweets.

Many a mother has found it expedient to commit to the flames a book which she found was undermining her child's better nature, even though bound in crimson and gold. Do not spare for the binding if it is hurtful to the lad, no, nor for the giver, even though it was his "very best auntie." Your child's real good is above all such considerations.

Children cannot discriminate between the good and bad, themselves. You must do the choosing for them. Hence the great responsibility that rests upon you. Always make it a rule to choose something innocently amusing rather than something coarsely grotesque, no matter how taking it may be.

A gentleman once said he would about as soon introduce a viper into his household as one of the old comic almanacs which used to be so much in vogue; yet they were mild compared with much of the literature prepared for children this and every year. Olive.

Airing the Beds.—It must be a false idea of neatness which demands that beds should be made soon after being vacated. Let it be remembered that more than three-fifths of the solids and liquids taken into the stomach should pass off through the pores of the skin,—seven millions in number,—and that this escape is most rapid during the night, while warm in bed. At least one-half of the waste and putrid matter (from twenty to thirty ounces in the night) must become more or less tangled in the bedding,—of course soiling it,—and a part of this may become re-absorbed by the skin, if it is allowed to come in contact with it on the next night, as it must if the bedding is not exposed for a few hours in the light. We may well imitate the Dutch example of placing such bedding on two chairs near the window in the sunlight, or in the window, that the best purifier known, the light of the sun, may dissipate their impurities, or neutralize them. At least three hours, on the average, is as short exposure as is compatible with neatness.—Congregationalist.

CORRESPONDENT'S CORNER.

Will you please give me directions in your columns for making a bundle of everlasting flowers ornamental? And obligo A Rural Reader.

We should be pleased to have the above question answered by some of our sisters. R. C.

That indigestion or stomach gas at night preventing rest and sleep, will disappear by using Hop Bitters.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

BREAD RISING.

BY CHIEF COOK.

If we understood the principle upon which any household operation is performed, we would have the ability to vary its mere manipulation to suit our conveniences or our means. If all the bread makers were scientifically learned, the average health of the human race would, in less than a generation, be improved seventy-five per cent. Filling the stomach with food intended to nourish, but which is inherently unable to do so, is a drag upon all human advancement greater than can be easily imagined. Good food, good blood, good body, good brains are natural sequents. The act in bread making, called rising, is the mere expansion of a gas created in the dough itself, or introduced there after being produced elsewhere. Common beer yeast, hop yeast, soda and sour milk, soda and tartaric acid, baking powders, all create a gas in the dough by the action of the chemical antagonisms of which they are composed. This gas, after being thoroughly and minutely mixed through the mass by kneading or stirring (in the case of batters), would never make light bread without the agency of heat. It is one of the economies of domestic operations, that heat is necessary to cook the dough into an eatable condition, as the same heat expands the minute invisible globules of gas, so as to force the particles of dough apart, leaving it when baked in the spongy condition called "light." This gas which is highly exhilarating if taken into the system in quantity, is also perfectly harmless, though in every case, the two substances which by their being mixed together produce this gas, are highly injurious, and in sufficient quantity, either is fatal to human life. If in mixing together soda and acid, both deadly poisons, we put more of either than the other can render inert in forming the gas, the excess remains in the bread and is eaten, and every one who eats of such bread is at once poisoned. The list of diseases which this wholesale mode of poisoning, either produces or renders the system liable to, is too large to be intruded upon the pages of this journal.

The excess of soda is seen, tasted, smelled and felt, in the yellow, acrid, pungent character given to the bread or biscuit, and its effect upon the stomach and head. An excess of acid is detected by sourness of the bread. It is of the first importance, then, that the proportion of the two should be exactly right; two-thirds of acid to one-third of soda is correct, if both are pure; but if either is weak from any cause, more must be put in. Egg-rising is quite another affair; it is always pure, safe and perfectly wholesome. Beating eggs into flour merely carries bubbles of *air* into the batter, no gas here, no possibility of being poisoned; baking expands the bubbles of air, the batter rises, the heat fixes it at the right point and holds it there in the form of the most wholesome and most nourishing bread known, peculiarly fit for infants, or invalids, upon whose systems "cooks' poisons" would run riot.

But the best and most wholesome rising is frequently ruined by bad baking. Heat expands the little bubbles of gas or air; but if this expansion is carried on in too cool an oven, they burst into the atmosphere of the oven; the dough is still soft, and the bread "falls" or collapses. The heat must be a rising one, so that at the moment the dough is just porous enough to be light, the heat bakes it into bread, and all danger of heavy bread is passed; thorough baking after that is a mere question of time.

The study of this subject and the expert and certain application of it in making our "daily bread," are paramount with the value of health and long life.

HOLDERS.

I wonder if every lady of the Rural knows what nice things holders are for either a kitchen, sitting-room or parlor stove. I was in a neighbor's house, the other day, and, as true as Gospel, one of the young ladies used the skirt of her cashmere dress to open the stove door; and when we went out to tea, she took her pocket handkerchief to lift the tea-pot from the stove to the table; and her other sister took a plate of hot biscuit from the oven with her apron. Now, they are "real" nice, smart girls, and know how to work; but I was sorry to see them use their clothes for holders, because it is not economical or tidy. It is but a few minutes' work to make a holder; have it of three or four thicknesses of old flannel, make a cover of cloth that will wash; sew on a loop or ring to hang it up by and you will find it pays for itself a dozen times a day. I hope the girls won't think grandmother is always scolding, but I cannot bear to see girls brought up slack and shiftless, and I would rather make a holder and give it to a girl than see her grab up a nice dress with which to take hold of a hot stove door. It makes me press my lips tightly together to keep from speaking about it. But, there! Girls will be girls, and I presume they never thought a thing about it. But I hope they will learn as they grow older; and as I have spoken of it, perhaps some of them will go right to work, and make holders for every stove in the house. If I thought they would, I would tell them that round holders bound with bright colors, look really pretty to hang up near a sitting-room stove, while a holder made in the shape of a butterfly, with the wings worked with bright worsted, is quite ornamental in a parlor. But square ones are the best for a kitchen, and ironing table. The next time the girls want some new fancy work I would advise them to try their hand at making up a batch of holders.

Grandmother.

DOMESTIC RECIPES.

Cocoanut Cake.

Two cups of granulated sugar, one-half cup of butter, three eggs, a cup of milk, three cups of flour and two teaspoonfuls of yeast powder. Bake in jelly-tins. For filling, grate one cocoanut; to two-thirds of it add the beaten whites of two eggs and a cup of powdered sugar. Put this between the layers. Mix two spoonfuls of powdered sugar with the rest of the grated cocoanut and strew on top of the cake.

Potato Puff.

Mix two cupfuls of mashed potato, two spoonfuls of melted butter and some salt to a light and creamy state, then add two eggs, yelks and whites beaten separately and very light, and about six tablespoonfuls of cream or rich milk. Pile in a rough form on a pudding dish and bake in a quick oven until nicely browned. Eat at once.

Parsnip Fritters.

Scrape and, if large, cut in pieces and boil tender. Mash them, season with pepper and salt and to every two cups of mixture stir in a large teaspoonful of flour and a beaten egg. Form into small cakes and fry on both sides a light brown.

Spinach.

Look over, wash carefully, boil, in just enough water to cover, until tender. Squeeze out all the water, put through a colander, return to the fire and season with butter, pepper and salt. Prepare some thin slices of buttered toast, press the spinach into cups and on each piece of toast place a cup form, with the half of a hard-boiled egg pressed into the top of each.

Onions.

Put into salted boiling water with a cup of milk and boil until tender. Take out carefully, arrange in a baking-pan with pepper, salt and a bit of butter on the top of each, pour in a little of the liquor they were boiled in, and brown in a quick oven. MARY B.

Cleaning Mica.

The coal fire went out the other day and in lighting it, the wood necessarily had a bad effect on the mica, smoking it to a deep brown. Our amateur housemaid did not like the appearance and domestic economy forbade us to throw it away. So she took out the pieces, one at a time, soaked them in vinegar and water, rubbed them gently with a piece of soft flannel and replaced thence almost as good as new. For stoves where much mica is used this should be worth remembering.

ANNIE L. JACK.

QUESTIONS ANSWERED.

Washing Fluids—Washing Machines.

I have a dread of washing-day on account of the labor of rubbing the clothes. Cannot you give me a recipe for a harmless fluid or other preparation to put into the boiler that will aid in removing the soil and stains without such hard labor? ANNIE B. CLARK.

ANS.—The following was given us by a lady, with the assurance that it was positively a harmless washing fluid, used in the proportions given, and we are in no wise disposed to question the authority:—Two pounds of soda-ash, one-half pound of unslaked lime; pour over nine quarts of cold water and let boil 20 minutes. Take from the fire, add two quarts of cold water, let settle, pour off and bottle. Soak the clothes over night in cold water. In the morning wring out, soaping the soiled parts. To a good-sized boiler half full of water, allow one-half pint of the fluid. Put in the clothes and boil 20 minutes. The clothes are then taken through one suds and the usual rinsing waters. About a year ago we received a Robbin's Washer and Bleacher upon trial. We confess we were loath to try it, having a deep-seated prejudice against washing machines of every description. But at last we were obliged to acknowledge that the little machine did all that was claimed for it. It has been in use in our family most of the time since, and we have had no reason to change our first opinion of it. We think it a saving of labor and time and much to be preferred to washing fluids. But of late we have received complaints that "it is not all gold that glitters;" that the thin coating of white metal soon wears off, leaving a baser metal underneath, which rusts and thus ruins the clothes. Will not those of our readers who have used this washer give us their experience?

Keeping Eggs.

Will eggs keep packed in oats or chaff from Spring until Winter? Please give a recipe for a pickle. A READER.

ANS.—Yes, we should think so, but would prefer chaff to the oats, and dry, sifted coal or wood ashes to either. The eggs should be taken daily from the nests and packed, small end down, and set away in a cool and dry place where the temperature will not rise above 60° or 65°. For a pickle, see directions given in RURAL of February 26, page 139.

A fretful mother and a cross child indicates ill health, requiring only Hop Bitters to remove.

THE
Rural New Yorker's
REMARKABLE
CLUBBING COMBINATIONS,
For 1880-81.

Read Them.

Four of the most Enterprising Journals in the country Club with the Rural for nearly the price of one.

The Inter-Ocean,
Globe Democrat,
Detroit Free Press,
New York World,

The Greatest amount of Reading Matter and the Lowest Prices of any Clubbing Combination heretofore offered.

The Rural Home fully supplied—The News of the World—the most trustworthy Agricultural and Horticultural Information—Seeds, Plants—All for about the price of one good paper.

THE WEEKLY INTER-OCEAN (Chicago, Ill.) has no superior as a first-class secular and political newspaper. It is a large, eight-page journal, with seven columns to the page, price $1.15. It will be sent one year with the RURAL NEW-YORKER, and the RURAL'S seed and plant distribution, for only $2.75.

THE WEEKLY DETROIT FREE PRESS (Detroit, Mich.), one of the most popular weeklies in the United States, combining wit and humor with the best literary and secular matter; Also the "Household," a bright and sympathetic paper for the home circle, will be sent one year with the RURAL NEW-YORKER and the RURAL'S free seed and plant distribution for only $3 50.

THE WEEKLY NEW YORK WORLD (New York), a live, enterprising and ably-edited newspaper, full of the latest political, secular and literary news of the day, price $1 00, will be sent with the RURAL NEW-YORKER one year, and the RURAL'S seed and plant distribution, for only $2.75.

THE WEEKLY GLOBE-DEMOCRAT (St Louis, Mo.), the leading secular and political newspaper west of the Mississippi River, ably edited and in every respect a first-class weekly journal, price $1.00, will be sent one year, with the RURAL NEW-YORKER and the RURAL'S free seed and plant distribution, for only $2.75.

Specimen copies of any of the journals here announced as clubbing with the RURAL NEW-YORKER *will be sent without charge to all who apply. The application, however, must be made to the journal of which specimen copies are desired. The subscriptions, however, may be sent to us and will receive prompt attention.*

Musical Instruments.

BEATTY

17 STOPS
5 SET GOLDEN Tongue Reeds.
Sub Bass & Oct. Coupler.

☞BEATTY'S OFFER FOR THE SPRING SEASON!

☞ I will sell this instrument, boxed and delivered on board cars, here with Stool, Book and Music for only

$85.

VISIT MY FACTORY.

A REDUCTION OF $5.

Those who visit my Factory here and select instrument in person, are entitled to $5 from above price, to pay traveling expenses.

☞This beautiful Piano Upright Cabinet or Parlor Organ (Like Cut), The **Paris** New Style, No. 5,200. Height, 70 in.; Length, 48 inches; Depth 24 inches; Contains (5) Five Octave, (5) Five set of the celebrated Golden Tongue Reeds, as follows: Set powerful Sub Bass Reeds, set of ⅔ octave of the famous Vox Celeste Reeds which produce the sweetest tone ever heard; set of 1 octave of the new solo combination the Celestina or French Horn reeds, which exactly imitates a French Horn, besides 2 sets of 2 1-2 octaves each of the principal or regular Golden Tongue Reeds, making in all a beautiful combination, with which the performer can (by the aid of Beatty's new patent stop action) produce any variety of tone desired. It is, therefore, necessary to connect (17) seventeen stops with the above action in order to get the greatest possible variety. (No "dummies.") This combination is something entirely original. Names of stops are as follows: 1) Diapason Forte, 12) Principal Forte; 3) Sub Bass, (4) Bourdon, (5) Dulcet, (6) Diapason, (7) Grand Organ, (8) Celestina, or French Horn (9) Vox Humana, which imitates the human voice! (10) Aeolian, (11) Echo, (12) Dulciana, (13) Clarionet, (14) VOX CELESTE! which is by far the sweetest and most perfect that has ever been attained—Charming! is the universal exclamation of critics and lovers of sweet music who have heard it; (15) Octave Coupler, which doubles the power, (16) Flute forte, (17) Grand Organ knee stop, by the use of which the entire power of the instrument can be thrown on or off by the knee without taking the hand from the key board. It is a valuable improvement in real Organs. I have named this Organ, THE PARIS, because it has such a beautiful appearance; the case is built of solid black walnut, elegantly carved, finely veneered, with costly wood placed on the top, front, and ends, as shown in cut; handles, lamp stands, fancy pocket for music, two inner swells, rollers for moving, upright bellows, made of the best quality of rubber cloth, steel springs. The pedals are covered with metal, instead of carpet, which will last a life time. This Organ is truly a beautiful piece of parlor furniture, and the home of the wealthy, the millionaire, banker, or business man will find it an ornament to their parlor. I will sell this instrument, boxed and delivered on board cars at this place, including Stool, Book and Music, for only $85. ☞Please send in your order at once. You may order by letter or telegraph; can be shipped at an hour's notice. Remit by Post Office money orders, Express prepaid, or registered letter, or by bank draft. Money Refunded and freight charges will be paid by me both ways if in any way unsatisfactory, or you may pay me only after you have fully tested it at your own home. Send reference or evidence of your responsibility if you do not send the cash with order. Every organ of my manufacture when introduced in a new locality, sells many more. Often 25 sales are traced from the first instrument sold. It becomes a Standing Advertisement at your own home. If you do not want an instrument yourself, will you please hand or mail this offer to a friend who wishes to purchase. Nothing saved by long correspondence. Order direct from this Advertisement.

NOTICE.—Those desiring to buy the above Instrument are earnestly requested to visit my Factory here and make their own selection in person. To all such I will allow a reduction of $5 from the above price to pay your expenses. This is certainly a very fair offer. Please come and examine the Instrument. IT SPEAKS FOR ITSELF. If you do not purchase now, no harm done; you are at least heartily welcome to look through my establishment.

☞Address, or call upon DANIEL F. BEATTY, Washington, New Jersey.

HOPE FOR THE DEAF
Garmore's Artificial Ear Drums

PERFECTLY RESTORE THE HEARING and perform the work of the **Natural Drum.** Always in position, **but invisible to others.** All Conversation and even whispers heard distinctly. We refer to those using them. Send for descriptive circular.

GARMORE & CO.,
S. W. Corner 5th & Race Sts., Cincinnati, O.

$66 a week in your own town. Terms and $5 outfit free. Address H. Hallett & Co., Portland, Maine

Miscellaneous.

BOWKER'S
HILL AND DRILL
PHOSPHATE
SEND FOR PAMPHLET.

This is a true bone superphosphate, and may be used *on any crop*, in the hill or drill or broadcast, either *with* or *without* manure, and will produce a much earlier and larger crop. In the Report of the Mass. Inspector of Fertilizers, its valuation is from $3 to $10 per ton higher than other Phosphates which sell at the same price. The past year over 3000 tons were sold against 100 tons three years ago, showing that it is liked by the farmers. If there is no local agent near you, send to us.

Also for sale STOCKBRIDGE MANURES.

BOWKER FERTILIZER CO.
BOSTON & NEW YORK

$72 a week, $12 a day at home easily made. Costly outfit free. Address True & Co., Augusta, Maine.

40 Happy Day, Chromo, Lace, &c., Cards, with name & morocco case 10c. H. M. COOK, Meriden, Conn.

$5 to $20 per day at home. Samples worth $5 free Address Stinson & Co., Portland, Maine

20 Gold and Silver Chromo Cards, with name, 10c. post paid. GEO. I. REED & Co., Nassau, N. Y.

102 YOUR NAME In New Type on 102 Chromos, 10c. All new styles, designed by best artists. *Bouquets, Gold Chromo, Birds, Landscapes, Panels, Winter Scenes, etc.* Best collection of Cards ever sold for 10c. Sample Book containing samples of all our Cards, 25c. Largest Card House in America. Dealers supplied with Blank Cards. AMERICAN CARD CO., Northford, Ct.

NURSERY FOREMAN WANTED! One who knows how to propagate and grow all kinds of first-class nursery stock. Address with reference P. O. Box 1643 Philadelphia, Pa.

News of the Week.

HOME NEWS.

MONDAY, March 8, 1881.

On Friday last, James A. Garfield, in the presence of fully 50,000 people, took the oath of office, and became President of the United States. All the exercises were conducted promptly and in good order, and the scenes attending the inauguration were in many respects the most noteworthy ever known in connection with a similar ceremony. Mr. Garfield's inaugural address is dignified in tone and devoted to the general subject of the changes wrought in the political system and political life of the nation. It was delivered in a pleasing manner, and received with frequent applause. Among the honored of the land who occupied the platform where the address was delivered, sat Mr. Garfield's mother. She listened with rapt attention to every word of the address, and after the oath of office was administered, the new President, turned reverently and kissed his mother and then his wife. The procession was a grand affair, and it was not until about two hours and a half had elapsed from the time the head of the procession passed the President's stand, that the new magistrate was released from his labors of bowing and saluting the passers-by. After the procession had disbanded the usual reception was given at the White House. In the evening, the Inauguration Ball took place at the National Museum Building, and it is universally conceded to have surpassed anything of the kind ever before held. This closed the day, and our new President and Vice President are duly installed in the highest offices with which they can be honored by the people.

President Garfield has chosen, as his cabinet, the following named gentlemen:

Secretary of State—James G. Blaine, of Maine.

Secretary of the Treasury—William Windom, of Minnesota.

Postmaster-General—Thomas L. James, of New York.

Secretary of War—Robert Lincoln, of Illinois.

Secretary of the Navy—William H. Hunt, of Louisiana.

Attorney-General—Wayne MacVeagh, of Pennsylvania.

Secretary of the Interior—Samuel J. Kirkwood, of Iowa.

The formal presentation of the obelisk to this city took place Washington's Birthday at the Metropolitan Museum of Art, in the presence of a large concourse of people. Secretary William M. Evarts made the presentation speech, and Mayor Grace, on the part of the city, received the gift in a neat little speech. Mr. Vanderbilt has given $103,732 in defrayment of expenses for the removal of the monolith.

After a struggle of several weeks to elect a U. S. Senator, Pennsylvania's law-makers have succeeded in giving John I. Mitchell that position. He came in as a "dark horse" at the eleventh hour, and was nominated on the 35th ballot. The final vote stood Mitchell 150, Wallace 92, McVeagh 1, Brewster 1.

The University of Pennsylvania recently conferred the Degree of Doctor of Laws on President Garfield.

The Senate celebrated the anniversary of Washington's birth by the passage of a joint resolution to give the Father of his Country a thirty-thousand-dollar monument. This patriotic proposition was not adopted without considerable discussion. The last Congress, it appears, appropriated $3,000 for a stone to mark the birthplace. Senator Johnston brought up a new bill to add $27,000 to it, so as to make the total $30,000.

The Arkansas Senate recently adopted a joint resolution fixing the pronunciation of the name of the State as "Arkausaw." If another resolution, making the spelling of the word the latter way, should be adopted, something of philological importance would be accomplished.

At a meeting of the World's Fair commissioners on the 23d ult. Grant said he could not attend much to the enterprise for several months, as he intended to leave the city. He was surprised at the little interest taken in the affair and recommended another effort to secure Central Park as a site. There still seems to be a considerable uncertainty about the location of the Fair Grounds. The attempt has been made to secure a portion of Central Park but it has failed. Morningside and Riverside Parks have been suggested as being better adapted to the purpose than Inwood, but it is probable that the latter site will be the choice. Subscriptions are being handed in rapidly, and everything looks favorable.

Minnesota's capitol was burned on March 1. The flames first appeared in the dome, but soon spread rapidly, the old, dry wood-work burning like tinder. It is thought to have been the work of an incendiary. The new market hall is being fitted up for the use of the Legislature.

A terrible railroad accident occurred on the Hannibal and St. Joseph Railway, near Macon, Mo., on Tuesday last. Two trains were demolished, and several persons were killed, and many more injured. A broken rail threw the cars from the track.

Another "worst storm of the season" has been raging in the Northwest. Reports from Wisconsin, Iowa, Illinois and Michigan say that nothing like the storm of Thursday last has ever been known in those sections. A dispatch from Elgin tersely puts it:—"No trains; no mails; no Chicago papers; no business." On the 3d inst. no trains were run in the entire State of Wisconsin, and railroad men say that it will be a week before trains can be run regularly again. The suffering in interior towns was greatest. Much trouble was found, even in cities, in procuring food and fuel, and great distress prevailed.

The interest of the Robinson estate in the Robinson Consolidated Mine, near Leadville, Col., has been sold by the administrator to Wilson Waldingham, of New York, for $1,000,000. Mrs. Forbes, of Plainfield, Mich, is sole heir to the estate.

Senator David Davis can safely be said to be the most extensive land owner in Central Illinois, and his total wealth, at a fair estimate, can be placed at $2,000,000. His taxes amount to about $27,000 yearly. Although a lawyer and recently a judge, Mr. Davis made his fortune in real estate. He has the handsomest residence and grounds in Illinois.

Vennor's latest forecast of weather for March, is as follows: There will be a rapid moderation on the 4th or 5th to warmth, but the temperature will again fall on Sunday night or Monday, and a week of extremely cold and stormy weather will likely ensue, with some hours of heavy snow fall. The 17th and 18th days, and possibly the 16th, come within another downward curve of the weather line, as do also the 24th and 25th.

The proposals for the new City Hall in Albany were opened Tuesday night. The lowest bid was made by Norcross Brothers, Worcester, Mass. Their bid was $206,000. We hope this building will not be modeled in all respects after its "big neighbor."

(St. Louis Chronicle.)

Trial by Jury.

Some believe that even this form of trial is not perfectly free from prejudice. But in our section, St. Jacobs Oil has been tried by that great jury—the public—and been judged the infallible cure for Rheumatism and all painful diseases.

AGRICULTURAL NEWS.

The Missouri Legislature will appropriate $15,000 to encourage the production of sorghum sugar, and the Mo. Ag. College will spend the money.....In response to the offer made by the American Humane Association for an improved car for the transportation of cattle, 420 models and almost 200 plans and sketches were received ....Accounts of the famine in some portions of Russia are deplorable. In some villages, it is stated, people die of hunger every day, and men pillage solely for the purpose of being put in prison, where they are at least fed enough to keep them from starving. In the East, bands of Kalmucks massacre entire villages to obtain their provisions. The Baskirks sell their children for a little flour, and the Kalmucks dig up the bones of horses that died of the plague last year, in order to grind them for cakes. Some villages are entirely deserted, all who were able having fled to the cities, abandoning the old and young to their fate. The chief trouble is that means of transportation are wanted to carry the surplus crops of one section to feed the destitute in another.....Wm. F. Dalrymple, of the famous wheat firm in Dakota, it is said, claims that his clear profit for 1880 was over $250,000. He raised a half million bushels of wheat on 24,000 acres.

An effort is being made in the Legislature of this State to regulate the storage charges on grain. The leading section of a bill for this purpose reads:

That the maximum charge of receiving and delivering grain shall not exceed one-quarter of one cent a bushel each, and the storage thereof for the first 30 days or any part thereof, one cent, and for each 15 days or part thereof, after the first 30 days, one-quarter of one cent per bushel. Provided, however, that grain damp or liable to early damage, as indicated by its inspection when received, may be subject to one cent a bushel storage for the first 10 days, and not exceeding one-quarter of one cent per bushel for each additional five days or part thereof. A quarter of one cent per bushel charged for receiving grain shall include all cost of what is called "trimming" to the leg of the elevator.

The trouble at Baltimore and elsewhere last Fall showed that some law on the matter is needed besides the arbitrary exactions of warehouse owners. Then ultimately "the farmer pays for all," and all the better for him if exactions are moderated by law.....The Signal Service is perfecting a system of weather warnings by which farming communities near railway stations are to be notified of probable clear, rainy, or variable weather, by a system of variously-colored rockets.

A corporation has been organized at St. Louis, Mo., called the St. Louis, New Orleans and Foreign Dispatch Company, to forward in bulk grain and all kinds of produce and merchandise direct from St. Louis to Liverpool and other foreign ports....

...Mr. W. H. Hughes, who is a relative of the founder of the Rugby Colony, Tenn., writes from there that the rumored migration of the colony to Minnesota is all nonsense. The colonists are preparing to put in their Spring crops.

Cattle are dying in some parts of Kentucky from eating tobacco.....The draining of Lake Okechobee, Florida, lately referred to editorially, will reclaim 12,000,000 acres of excellent sugar land....The Southern California Citrus Fair will be held at Los Angelos, in March. Half the proceeds will be used to encourage immigration to Southern California.....Dr. McMurtrie of the Agricultural Department, thinks that the best localities for beet-raising in the United States are, New England, New York, Michigan, Wisconsin, Minnesota, Dakota, Washington Territory, Oregon, one or two counties in Pennsylvania, and Licking County, Ohio.

Our exports of live stock to Liverpool and London during 1880 are shown in the following table:

	Liverpool			London.		
	Cattle.	Sheep.	Pigs.	Cattle.	Sheep.	Pigs.

Of these the following numbers were lost during the voyage, according to a statement of the arrivals of live stock, published by Vaughn & Co. Liverpool.

	Cattle.	Sheep.	Pigs.
Of Liverpool shipment.....	3,408	2,136	1,423
London	3,134	868	133
Total.....	6,542	3,004	1,556

The fuel famine in Minnesota has been so great that many of the prairie settlers have burned stables, out-houses, farm implements and even furniture to keep themselves from freezing.

The mortality among stock on the Western plains during the Winter has been unprecedentedly severe. Thousands have died from cold aggravated by the prostration due to insufficiency of food, and hundreds of thousands from starvation, the scanty herbage on which stock eke out a meagre livelihood, being buried under an irremovable load of snow. The loss is said to have already amounted to 20 per cent. Great numbers of sheep have perished here and there, buried under enormous snow drifts. In many parts of New Mexico and some parts of Colorado great numbers of cattle are also dying from eating what is known as the "Loco" weed, which is spreading considerably among the wild grasses of that section. It becomes green before the grasses, and cattle therefore eat it, and become affected with a species of "blind staggers," owing to the poisonous nature of the weed. A petition is being circulated for the appointment of a government commission to investigate the matter and discover an antidote.

On the tobacco crop of Virginia alone, the Government receives an annual revenue of about $7,000,000. This product of that State is steadily increasing, notwithstanding it has been grown there for nearly two centuries.

According to latest advices the total amount appropriated for the Agricultural Department is $330,050. Among the special items is an addition of $500 to the salary of the Commissioner (a restoration to $3,500); examination of and report on wool, $5,000; for investigation of animal diseases, $25,000: experiments on tea, $5,000; insect investigations, $10,000; for continuance of experiments on sorghum sugar, $17,000; beet sugar, $70,000; for a building on the department grounds for the display of agricultural implements, $10,000.

Nature's Remedy.

It is evident that a large portion of our city people suffer from diseases of the liver, bowels, or kidneys. Kidney-Wort is nature's remedy for them all. Those that cannot prepare the dry can now procure it in liquid form of any druggist.—Globe-Democrat.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Thousands of ladies to-day cherish grateful remembrances of the help derived from the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. It positively cures all female complaints. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

A Great many persons become insane from sleepless nights that Hop Bitters would have prevented.

The People's World-wide Verdict.

Burnett's Cocoaine has been sold in every civilized country, and the public have rendered the verdict that it is the *cheapest and best Hair Dressing in the World.*

Burnett's Flavoring Extracts are invariably acknowledged the purest and the best.

The Markets.

SPECIAL FROM THE CHIEF CENTRES.

Until Saturday, March 7.

St. Louis—WHEAT dull; No. 2, Red Fall, $1 01¼@$1 01⅞, cash and March; $1 03⅝@1 03¾, April; $1 05¼@1 05¾, May; No. 3 do., 99c.; No. 4 do., 91½@92½c. CORN easy at 39¼c., cash and March; 39¾c., April; 40⅝@40¾c., May; 40¾@40¾c., June. OATS dull at 33½c., cash; 33c. bid, April; 34c. bid, May. RYE higher at 98c. PORK dull at $15 asked. LARD nominal. Bulk-meats dull, weak and lower to sell. Bacon easy; little done.

Chicago.—WHEAT in fair demand; No. 2 Chicago Spring, 99¾@99¾c., cash; 99¾c. March; 99¾c. bid, April; $1.03¾ bid, May; No. 3 do, 88@90¾c; rejected, 73@80c. CORN in fair demand at 37¾@38¾c., cash; 37¾c., March; 38¾c., April; 42½c., May; 42c., June; rejected, 37@37½c. OATS inactive at 31½@31¾c., cash; 29@29½c., March; 29½c., April; 33¾c., May. BARLEY $1 05, cash; $1.07, April. PORK in fair demand; new; $14.45@14 50, cash; 14.57½@14 60, April; $14 72½@14.75, May; $14 87½@14 90, June. LARD inactive at $9 87½, cash; $10.02½@10 05, April; $10.12½@10.15, May; $10 17½@10.20, June. BULK-MEATS—Shoulders, $4.75; short-rib, $7.65; short clear, $7 90. BUTTER—Choice to fancy creamery, 30@32c.; extra do., 26@29c.; choice to fancy dairy, 20@25c.; good do., 15@19c; common to good Summer and Fall made, 12@15c; good ladle-packed, 15@16c.; good to fine do., 18@22c.; good to choice roll, 18@20c.; common to fair, 12@17c.; grease butter, 8@10c. CHEESE—We quote: Choice to fancy full cream of fine flavor at 13¾@14c.; good do., 12@13¾c.; do. lots that are off in flavor, 8@11c; choice part skims, 10@11¾c.; good do., 9¾@9¾c.; common to fair, 8@9c; off stock, 3@5c. HAY—A good demand and prices fairly supported. No. 1 timothy at $14.50@15 50; No. 2 do., $13.00@14 50; mixed do., $12.00@13 00; upland prairie, $10 50@11; No. 1 prairie, $8.50@9.50; No. 2 do., $7.50@8 50. WOOL—Demand light; market dull and weak as follows: Tub-washed, good medium, 43@45c.; do., coarse and dingy, 35@40c.; washed fleece, fine heavy, 33@35c.; do light, 36@38c.; do. coarse, 30@33c.; do. medium, 38@40c.; unwashed, fine, 23@25c.; do. fine heavy, 18@22c; do. coarse, 21@25c.; do. medium, 27@29c Hogs—Mixed packing, $4 90@5 30; light, $5.20@5.55; choice heavy, $5 60@6.00. CATTLE—Demand good at full prices; common to choice shipping, $4.30@5 25; export, $5.30@5 50. SHEEP—Demand good; fair to good, $4.50@5.50.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 8, 1880.

BEANS AND PEAS.—White beans have lost the advance of last week, but supplies are under good control and sellers are not pressing prime marks for home or export use at present quotations. Red kidneys extremely dull at $1.40@1.20; medium, marrow, pea and white kidney, $1.90@2.10; black or turtle soup, $1.40; Lima beans, $4.50@5. Green peas are firm with larger receipts; quoted $1.75@1 80 for Wisconsin; Southern B. E. peas, $2.10@2.15 per 2-bush bag. Comparative receipts of beans exhibit an improved home demand. Exports for the season are considerably below former similar periods and the stock in store is lighter than at this date last year.

BEESWAX—A small business is in progress and the market is steady at 24½@25.

BUTTER—There is a good steady Spring demand for the upper grades of butter and business would be of large volume if such styles were plentier. The abundant offering of low quality stock has been a severe detriment to the market for the past three weeks. Shippers cannot handle common off grade lots of Western and for that matter there is no encouraging call for fine shipping stales. It is hardly possible that quality will improve for wholesale purpose, and from the present appearance of the market, we are to have a slow dragging movement on ends and odd lots until the arrival of new grass butter pushes the surplus into grease. The market has suffered badly from adulterated goods. It is simply ridiculous to attempt to find a place for "mixtures" of so-called butter that have appeared. Butter very properly is yearly becoming more and more an article that sells upon its merit.

Creamery choice Western 33-31c; fair to prime, 28@32c; State 23@28c.; early packed 18@23c. State dairies, entire choice, 24c; Other, 18@23c.; firkins, 16@23c.; pails and half tubs fine 27@28c; other 16@25c; Welsh tubs, fine 24@25c; other 16@22c; Western imitation creamery, 18@22c.; dairy, fresh, 24@25c; other 14@23c; factory fine 20@22c.; poor to good 12@18c.

Receipts for week 18,674 pkgs.

Exports do. 2 785 do.

Strict good ordinary. 8 13-16 | Middling.. ....10 13 16

Receipts for the week, 25,510 bales, Exports do. 11,000 do.

DRIED FRUITS.—There has been a quiet market throughout, without new features and prices generally steady. Quotations are for

Evaporated apples at 8½@9c. for the better qualities; sliced apples at 5@6¼c. for good to choice North Carolina; 4@4½c. for Va. apples, 4@4½c. for Tenn. do; 4½@5c. for State do; 4½@5c. for western, Ohio and Mich. Peaches at 3c. for evaporated peeled; 1½c. for unpeeled do. N. C peeled at 20@28c.; for the better qualities, unpeeled peaches at do. for halves and 6@6½c. for quarters. Plums at 15@16c. Blackberries at 7½c. Cherries at 17½c. Raspberries at 23@24c. whortleberries 10½@11c.

EGGS—Receipts for week, 9,350 bbls.; do. last week 7,375 do. Lent opens with a fairly brisk demand; prices are at a good stock moving figure and it is important at this season to keep supplies going into use. Quality is excellent and this helps to keep trade steady. Quotations 20½@22c, the latter for nears.

FEED.—Sales at $20.50@21 for 40 to 60 lbs. $20.50@21 for 80 lbs; $21 for 100 lbs.

FLOUR—There is considerable activity and a firm market. Shippers have taken this week 3,400 bbls. and fully 100,000 bags.

Latest prices are: $4.60@4.10 for very inferior to very choice superfine State and Western; $4.25@4 50 for poor to choice extra State and Western, odd lots and lines; $4.50@4 65 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4 35@5.25; good to choice do at $5.3 @6.10, (very choice up to $6.25@6.50 and fancy at $6.50@6 75;) red and amber winter wheat, inferior to choice trade and family at $4.35@6; round hoop Ohio, $4.40@4 75; and trade and family brands of [illegible] $4.85@6.25, the latter for choice; St. Louis $4 60@5.50 for inferior to good extra; $5.50@6 35 for good to choice, and up to $6.75@7 for very fancy brands; Minn. clear, inferior to very fancy at $4 50@6; Minnesota "straight," poor to very choice, at $5 25@6.75, and patent inferior to fancy at $5 75@6.25; city mill extra at $5.50@5 60 for fair to choice for the West Indies; do. for England at $4.25@4.65 for poor to choice spring wheat; do. trade and family extras $5.60@6.75 do. for South America $5.65@6 0', the latter for very choice; No. 1 at $3 10@3.65 for very inferior to very fancy.

Receipts for week, flour, bbls. 114 510 corn meal, do. 675 | wheat, bush. 241,000; corn, do 481,800; oats do. 261,200, rye, do 31,875; malt, do 35,400, barley, do. 70,125 beans, do.. 15,0 0 rice, pkgs 1,775

Exports for week, flour, bbls. 17,600; corn meal, do. 1 150, wheat, bush 966,700; corn do. 457,500; oats, do. 2,475; beans, pkgs. 806; rice do 350.

CORN-MEAL—Sales at $3@3.10 for Brandywine and $2.50@3 for yellow Western.

FRESH FRUITS.—Exports of apples for week, 13 550 bbls. Many of them are going abroad on interior owners' account. Here the market is dull, many lots are swelling badly and smallest orders are accepted by all dealers. Supplies are large and the season will prove a touch one for dealers. Mixed lots at statien $1.25@1 75.

Baldwins and Russets $1 65@1.87; Greenings, $1.25@1.50; choice sweets $2; sweet apples of fine size and color are guiding a good market abroad. Cranberries unchanged. The cars more here than can be used at the present rate of trade, and the outlook for remnants is blue. Cape Cod bbls, $4@7; N. J, crates 1,25@2,50. Florida oranges quiet at a range of $1.50@3.50 for poor to choice original packages. Florida strawberries seasonably plenty and quoted at $1.25@1 50 per quart; hot-house do little better. Peanuts quiet with a large supply. Va hand-picked, 4½@4¾; other, 3¾@4; shelled, 3¾@3¾. Hickory nuts per bush. 75@85 Pecans 7@8¾c.

GRAIN.—Wheat has been in more active import demand, the shipments for the week reaching 1,124,000 bush.; and prices have ruled firm. Latest sales are of

Extra white at $1.19¾; No. 1 white at $1 18¾@1.19¾, do. March at $1,18¾@1,19¾; do. April at $1.19@1.19¾; do. May at $1.17¾@1.18¾; No. 2 white at $1 17¾@1.18; ungraded white at $1.18@1 19¾; mixed winter at $1,19¾; No. 1 red at $1.20; No 2 red at $1.21½@1 23, do. March at $1 21@1.2 ¾; do. April at $1.2 ¾@1.22¾; do May at $1.20¾ 1.2 ¾ No 3 red at $1.18¾@1. 0 ungraded red at $1 14@1.15¾; rejected spring at 97@97½

Rye at $1@1 01.

Corn is higher and active; shippers have taken this week 368,000 bush.; latest prices are for

New York No. 2 at 58@58¾c, do. March at 58@58¾c;

do April at 57¼@57¼, do May at 55¼@55¼. No. 2 old in store at 58. No. 3 at 56¾@57; ungraded mixed Western at 58@58¼; New York steamer mixed at 57¼@57¾. New York yellow at 58@58¼; New York steamer yellow at 57¾@58. York No. 2 white at 65; yellow Southern at 55¾@58¼.

Oats have realized better prices and demand fair; latest prices are for

No. 1 white at 47¾. New York No. 2 white at 46@46¼. No. 3 white at 44¼@44¼; N. Y. No. 2 at 44¼@44¼, do March at 44¼@44¼, do. April at 44¼, do. May at 45¾. No. 3 at 43¼@43¾, ungraded white Western at 45@48¾, ungraded mixed Western at 43@44¼, white State at 47½@50. No. 2 Chicago at 44¼.

HAY AND STRAW.—Supplies are liberal but demand is good and prices are sustained. Quotations are for

Hay, prime timothy at $1.20@1.25 ₱100 lbs.; medium timothy at $1.10@1.15 do. shipping grades at $1@1.05 do.; clover mixed at $1.05@1.10, clover at $1@1.05. do. Straw—No. 1 rye at $1.20@1.25 ₱100 lbs.; No. 2 rye at 80@85c. do.; oats and wheat at 80@85c. do.

HONEY.—Market nominal at last rates.

HOPS.—Exports for the week 865 bales. Prices are generally steady, although demand is moderate. Quotations are for

	Cents per lb.
New Yorks, crop 1880, choice	22 @23
Do medium	19 @20
New Yorks, crop 1880, low to fair	15 @17
Eastern, crop 1880	16 @22
Wisconsin, crop 1880	16 @21
Yearlings, crop 1879, choice	12 @18
Olds, all growths	4 @10
Bavarians	30 @35
Pacific coast, new	19 @23

POULTRY AND GAME.—The demand for dressed poultry is weakened by the observance of Lent; prices, however, are good for prime stock for special or unobstructed wants. Coarse tom turkeys slow of sale; frozen case stock when in good order does as well as fresh.

Turkeys, choice small sizes, 16@17c.; poor to prime, 12@15c. Chickens, choice, 17@19c., other, 12@15c. Fowls, 11@12c. Capons, large, 21@22c.; small and slips, 18@20c. Ducks, fair to dry-picked 14@20c. Geese, extra, 13@14c; other, 9@11c. Squabs, white, $1.50@5 ₱ doz. do dark, $2.25 2.50. The outside rates are for Philadelphia and other established near point marks of poultry

Live fowls are bringing good prices. Ducks and geese scarce and higher. Some selected chops of Western gray exceed $2 25.

Fowls, 12½@14c.; roosters, 7@9c.; turkeys, 11@14c; ducks, choice, 87½@$1.12; other, 50@75c.; geese, choice, $2@2.25 other $1 25@1 87; pigeons, 35@40c.

Wild pigeons are quoted at the strong rate of $1.75@2.00 ₱ doz. Wild ducks are not averaging fine: Western not wanted Canvas-back ducks, Southern, $1.50@1.75 ₱ pair, red-heads, 75c.@$1; mallard, 40@60c.; teal and widgeons, 30@40c.; common do, 20@30c.

PROVISIONS.—Hog products have been variable in price and quieter.

Mess pork quoted at $15 for old and $16 for new. Bacon at 8½ for long clear and 8 7-16 for short clear. Beef hams at $22½@23 Beef at $9 for plain mess and $10 for extra mess. Lard—Western steam at 10.45 for spot lots; 10.45@10.47½ for March and April; 10 50 for May and 10.62½@10.65 for June. Stearine at 10¾ for choice. Tallow at 6¾ for prime.

Receipts for week beef, bbls and tcs., 440 pork, 2,500 bbls. cut-meats, 33 300 pkgs, lard 21 025 pkgs.

Exports for week, beef, bbls and tcs., 3,625; pork, 5 325 bbls.; cut-meats, 15,504,300 lbs.; lard, 6,345,800.

VEGETABLES.—Exports for the week, 720 bbls. potatoes. Potatoes are quiet and outside rates not general. Bermuda second crops $5@6 ₱ bbl.

E. Rose, Eastern dug, $2.50, do. State, $2.12@2.25; do in bulk $1.87@2 12 Peerless, $2.00@2.25; Mercer, 1 75@2.00; Burbank $1.87@2 00; do. dug, $2.12@2.25; Peachblow $2.50; Snowflake, $2.00; Snowflake, bulk, $2@2.25; Pearless $1.75@1 87; do, dug, $1.87@2. A few new Southern items have appeared, but the weather here is against sales of specialties as yet A few bunches of Chas. asparagus brought $1: West India tomatoes, 15c @$1 ₱ box. Baltimore spinach, ₱ bbl $2 25@2.75; white and Russia turnips, 60@75c.; beets, 75c.@$1.; Hubbard squash, $1@1.25; marrow do. 50c.; currants, $1@1.25 onions, white, 16@6. 0 other, $3@3.25, cabbage, $1@$ ₱ 100, celery, $1@1.50 ₱ doz.

SEED.—Clover has a moderate demand, quoted at 8@8¾c. Timothy is without business and there is no fixed price.

TOBACCO.—Export demand is moderate, but home trade very good and prices generally firm.

WOOL.—Demand has been a little better this week; prices steady. Quotations are for

Ohio, Penn. and W. Va. washed fleeces, XXX and picklock, 45@48c; X, and XX 44@46c.; No. 1, 48@50c.; No. 2, 43@44c.; common, 38@40c.

STOCKBRIDGE
MANURES
SEND FOR PAMPHLET.
These manures are the richest fertilizers now manufactured, and the best substitute for, and costing *much less* than guano, which is now practically out of the market. Unlike guano, they *are not stimulants* and *exhaustive*, but *permanent* and *lasting*, being composed of bone, potash, etc. You can draw at one load enough for 3 to 5 acres, or as much plant-food as is contained in 20 loads of ordinary straw manure. Corn, potatoes, hay, etc., are bringing such good prices that it will pay to use the Stockbridge extensively. If there is no local agent near you, send to us

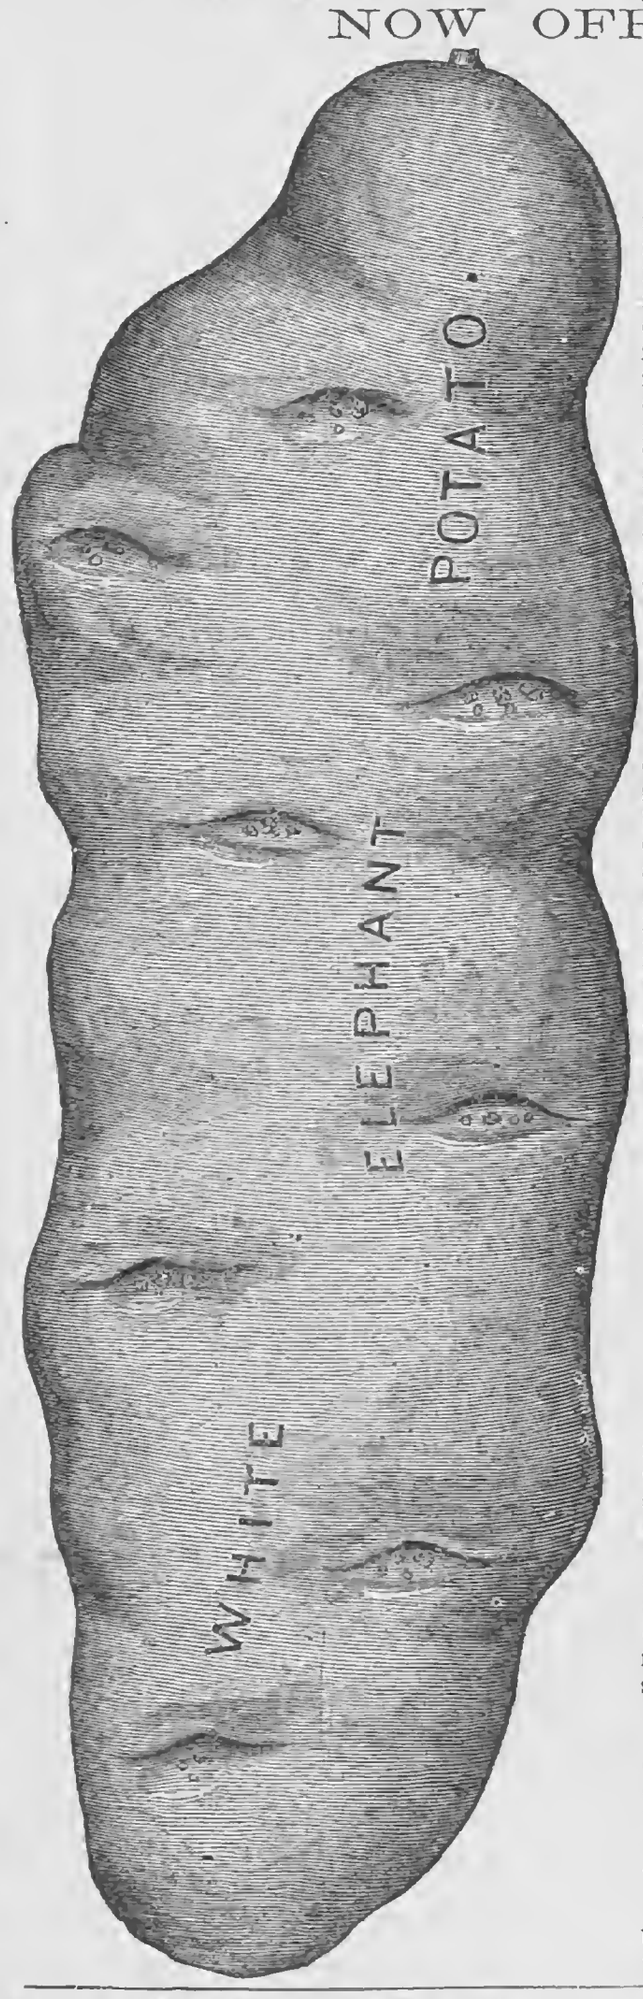
J. M. THORBURN & CO.,
No. 15 John Street, New York,
NOW OFFER:



"THE WHITE ELEPHANT POTATO."
This superb late variety was produced from a seed ball of the "Garnet Chili," fertilized with pollen from the "White Peachblow." Without hesitation we pronounce it as combining the best qualities of the foregoing varieties, viz: *wonderful productiveness, excellent quality and flavor, power of resisting disease, and great beauty*, not to mention the fact of its being proof against decay until far into Spring. These qualities alone would recommend it not only for field culture, but also for the private garden. From its origin it may be called a twin-brother of the "Beauty of Hebron," which it resembles in many respects, possessing many of those qualities which have rendered this latter variety so justly popular. Last season the originator planted one bushel of sixty pounds of "THE WHITE ELEPHANT," on one-eighth of an acre of ordinary soil, and therefrom harvested no fewer than fifty-seven bushels. The tubers, notwithstanding their great size, are **always solid**, and, growing closely together in the hills, the labor of digging is comparatively slight. The vines are very stout and vigorous, and have thus far resisted all manner of blight, turning yellow only at the proper season, and the potatoes ripening along with the "Late Rose." We claim that "THE WHITE ELEPHANT" not only possesses the unexcelled qualities of the "Beauty of Hebron, but also the wonderful productiveness of the old "California" of twenty years ago.
Price: ₱ barrel, $15, ₱ bushel, $6.50, ₱ ½ bushel, $4.50, ₱ peck $3, ₱ ¼ peck $2, or one pound by mail for $1.

ALSO
"PERFECT GEM SQUASH."
The Squashes are from four to six inches in diameter, flattened, of a creamy white color, slightly ribbed, and have a thin, smooth skin. The flesh is fine-grained, and when cooked is dry, very sweet, and has a delicious flavor entirely free from that strong taste common to all of the Winter Squashes. It is remarkable for its keeping qualities; in a dry, cool room, free from frost, they may be kept until Spring. In short, it is justly entitled to the name given it, being equal to the best Bush or Marrow Squash for Summer use, better than any other for Winter, a good keeper, very productive, a free grower, and worthy a place in every Kitchen Garden.
Per lb. $6, ½ lb. $4, ¼ lb. $2.50, per oz. 75c., per packet, 25c.
Descriptive Priced Catalogues of Vegetable, Flower and Field Seeds free to applicants.

NIAGARA, The New White Grape.
A few responsible parties in good grape regions are wanted to plant *vineyards* of this most promising of all grapes, to whom special inducements will be given, and payment for vines made contingent upon production of fruit.
Address THE NIAGARA GRAPE CO.,
Lockport, N. Y.
☞ For description of this Grape, see Rural New-Yorker of March 5.

My Annual Catalogue of Vegetable and Flower Seed for 1881, rich in engravings from photographs of the originals, will be sent FREE to all who apply. My old customers need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed House in America, a large portion of which were grown on my five seed farms. *Full directions for cultivation on each package.* All seed *warranted to be both fresh and true to name*: so far that should it prove otherwise, *I will refill the orders gratis.* The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables. I invite the patronage of *all who are anxious to have their seed directly from the grower, fresh, true, and of the very best strain.*

FARMING FOR BOYS AND GIRLS—NO. 14

HENRY STEWART.

How Plants Feed.

PLANTS do not feed *on* the soil. They are supported by the soil and their roots spread in it and take a firm hold upon it. They find their food *in* the soil, and search very actively for it. The roots are provided with a very large number of organs called root hairs, each of which is a feeder for the plant and imbibes whatever liquid food it may find in the soil. This food is dissolved from the soil by the water which is held between the small particles in the manner previously explained.

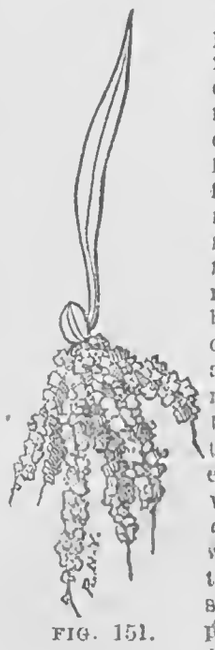

FIG. 151.

When a plant has become provided with roots it is able to find its own food, and this it does by pushing out into the soil from the roots a great number of very fine fibers called root hairs. If a young wheat plant is carefully lifted from the soft moist soil it will appear as shown at fig. 151. A quantity of fine soil will adhere to the root fibers which cannot easily be shaken off. If the root is carefully washed with water it appears to be made up of a number of fine, white fibers. If we look at it more closely through a magnifying glass, each fiber will be seen covered with short hairs, as shown at *a*, fig. 152. It is these hairs which take such firm hold upon the soil for they force themselves between the smallest particles of it and are only freed from these by careful washing to avoid breaking them, and then many are broken off in spite of the care, because of their fineness.

These hairs are the feeding mouths of the plant. As they force themselves into the soil they continually suck the moisture from between the small particles, which would be dust if they were perfectly dry, and pump it up through the roots into the stem, from which it goes into the leaves. If a small piece of a root fiber should be still more closely observed under a good microscope it appears to be made up of a number of cells as show at *b*, figure 152, and from some of these cells the root hairs would be seen to proceed.

The cells differ in shape. Some are round and some are oval, but when they are pressed together as they increase in size they become flat-sided, or six sided, and longer or shorter as the case may be The walls of the root hairs and the cells consist of a very thin membrane without any openings that are visible under the most powerful microscope, and yet the atom of food substances in the soil, which are also too small to be seen, can pass through these walls of the cells, and entirely through the plant. In these little cells there is always going on a work which requires for its execution a vast amount of force. This force is often seen in operation in the most wonderful manner, as when a growing tree forces a heavy stone wall from its place or raises, by its roots, a heavy pavement, and this force which is greater than any man could exert, is the work of these little cells which seem so weak and fragile that a breath could destroy them.

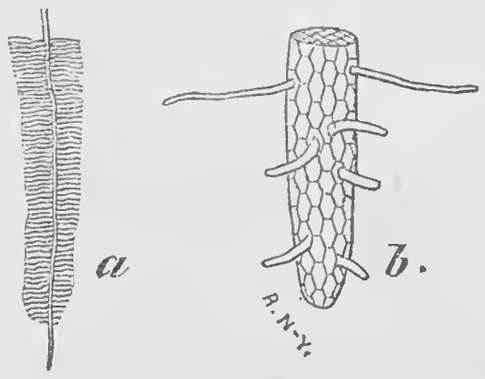

FIG. 152.

The food absorbed by the plant from the soil passes into the cells and from one to another by a very curious process known as osmose. This is the passage of liquids of different kinds through vegetable or animal membranes. It is more easily described as follows, than explained. If a wineglass is filled with pure water, and a piece of bladder is tied very tightly over the mouth of the glass, and this glass is then inverted in a bowl of salt or sugared water, the pure water in the glass, and the salt or sweet water from the bowl, pass and repass through the bladder until the water in the glass is as salt or sweet as that in the bowl. Sometimes one substance would pass entirely from the glass into the bowl, and another from the bowl into the glass, thus changing places. This operation is going on continually in plants and in animals; the plant food in the soil, thus absorbed by the roots passes through many millions of cells and membranes before it reaches the leaves; and the food of an animal dissolved in the stomach passes through the walls of the intestines into the blood vessels by the same process, so the blood is purified in the lungs and the muscles are built up from the blood in the same way. Indeed, the similarity between a plant and an animal goes much further, for the food of the plant, forming the sap, goes to the leaves, where it is acted upon by the air, is digested, and fitted to build up more cells by depositing the matter dissolved in it in the parts of the plant where new tissue is needed. Thus the plant grows from day to day.

A WORD TO THE COUSINS.

PERHAPS some of the RURAL cousins think it is not quite right that their letters do not appear in print, but let me explain. Our space is quite limited, hence we can insert only a part of the many letters we receive, and, as it is our motto to give only the best of everything to our readers, of course we must follow the rule here. It would please me greatly to gratify all my young correspondents, but I think they will admit that the best letters should have the preference. But I would not have them discouraged if a letter, now and then, finds its way to the waste basket. "Try, try again," is a good motto and it applies well here.

Now as Spring is coming on, I want all the cousins to see how well they can do with the seeds which we shall send them. Any questions which any one may ask, we will endeavor to answer. If there is anything the cousins wish to ask about gardening or floriculture, farming or fruit-raising, I shall be glad to aid them as best I can, and in this way we shall derive much benefit from our correspondence. [U. M.]

PERSONAL ITEMS.

The centenary of George Stephenson, June 9, 1881, is to be celebrated.

In early life, on the home farm, it is said that Jay Gould's special chore was watering the stock, and hence he's an adept at the business.

Lord Cowper, the Lord Lieutenant of Ireland, who is very wealthy, is exercising a sumptuous hospitality in Dublin.

The late Thomas Brassey, "Englands wealthiest son," so far at least as personal property was concerned, was a native of Cheshire, and bequeathed to his eldest son his modest patrimonial estate, a farm in Cheshire, but divided thirty millions of dollars between the three,

Prompt Relief in Catarrh and Bronchitis.

Mr. John Butler, of Port Eads, Louisiana, sent for the Compound Oxygen Treatment in May, 1879. In describing his case, he said: "I have been suffering with Nasal Catarrh for a number of years, but never so much as I do now. I have also a slight cough, which my doctor says is Bronchitis. *I am also suffering with Dyspepsia, and, in fact, I am in general bad health.*" In January, 1880, eight months after beginning the Treatment, he says: "*I am now in perfect health.* Dyspepsia, Bronchitis, pain in the heart and other complications all removed and yet I have not taken one-half of your medicine. My friends all congratulate me on my recovery. My thanks to you also. My weight before taking your Treatment was 118 pounds; present weight, 155 pounds." Our Treatise on Compound Oxygen, containing large reports of cases and full information, *sent free*. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

Real Estate.

New Publications.

MUSIC BOOKS FOR SCHOOLS.

Song Bells. (50 cts.) The latest book for Common Schools. By L. O. EMERSON. Has a great variety of cheerful, genial, musical songs, such as the girls and boys must like, and also a good Elementary Course.

Among our older and standard School Song Books, that are still favorites, and in constant demand, we mention **Whip-poor-Will,** (50 cts.) **Mocking Bird,** (50 cts.) and **Golden Robin,** (50 cts.) all by W. O. PERKINS.

Welcome Chorus. ($1.00) The latest Books for High Schools, Academies and Seminaries. By W. S. TILDEN. Is of the best character, and well fitted to follow those most successful books, the **High School Choir,** ($1.) and the **Hour of Singing,** ($1.) both by EMERSON and TILDEN; and the **Laurel Wreath,** ($1.) by W. O. PERKINS. We also mention **Emerson's Quartets and Choruses for Male Voices,** (60 cts.) just out, as a good book for practice in High Schools, Academies and Colleges.

Operettas and Cantatas for School Exhibitions.

Coronation, (60 cts.) Culprit Fay, ($1.) Fairy Bridal, (50 cts.) Flower Queen, (new, 75 cts.) Guardian Angel, (50 cts.) Hour in Fairy Land, (60 cts.) Miracle of Roses, (60 cts.) Little Bo Peep, (50 cts.) Maud Irving, (50 cts.) New Year's Eve, (60 cts.) Three Little Kittens, (50 cts.) Quarrel among Flowers, (35 cts.) Spring Holiday, (50 cts.) and Cinderella, (50 cts.) are all lively and pretty Cantatas.

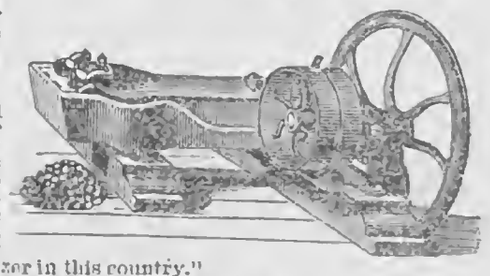
CHEAPEST AND BEST FERTILIZER.---FOLLOW NATURE.

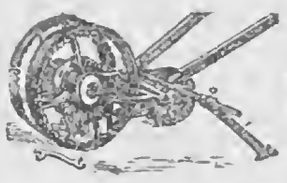
WHICH USES GROUND LIMESTONE IN MAKING SOIL.

Every Farmer can prepare his own FERTILIZER with an ORDINARY HORSE POWER by using

Forster's Combined Crusher & Pulverizer,



Crushes and grinds Limestone at one operation. Ground Raw Limestone has been used as a Fertilizer in Germany for 50 years, and found to be three times as valuable as **Burnt Lime.** With above Machine, it does not cost as much as Burnt Lime.—W. W. REED, of Erie, Pa., says: "The GROUND LIMESTONE proved to be the most economical Fertilizer showing a profit over Bone Dust of $1.96 per Acre; over Phosphate of $4.28 per acre; over Guano of $9.70 per Acre; and over Salt of $5.90 per Acre."—JOHN G. BEAR, Montgomery, Lycoming Co., Pa., says:—"I believe it to be the *cheapest* and *best* Fertilizer in this country."
ESPECIALLY VALUABLE FOR SPRING CROPS, CORN, ETC. Machine is exceedingly simple and not liable to get out of order. Address TOTTEN & CO., Pittsburgh, Pa. ☞ ONLY MAKERS.



THE PLANET JR. GOODS.
Let every man, woman, and child whether interested much or little in working the soil, send now for our carefully written Catalogue. We want all farmers who value labor-saving tools to study out our combined Horse Hoe, Cultivator and Coverer; Market Gardeners, who have acres upon acres on each of which our Double Wheel Hoe will *save its cost* yearly, to examine the merits of our fine garden tools; and every one who has even a small vegetable garden to read closely what the Firefly Hoe and Garden Plow will save them. S. L. ALLEN & CO., 229 Market St., Philadelphia, Pa.

Also Manufacturers of Lawn Mowers, Plows, &c., &c.

No Land on which the Sun Shines

Possesses greater natural advantages than our own, but there are portions of the great grain-bearing West and fertile South where atmospheric influences prejudicial to health militate against them, in some degree, as places of residence. Heavy rainfalls and the overflow of great rivers, which upon their subsidence leave dank vegetation exposed to the rays of the sun, there beget malarial fevers, and there also the inhabitants are periodically obliged to use some medicinal safeguard against the scourge. The most popular is Hostetter's Stomach Bitters, a preventive that has for over a quarter of a century afforded reliable protection to those whom experience in the futility of ordinary remedies for fever and ague, has taught to substitute for them. Whether intermittent or remittent, miasmatic fevers are conquered and averted by this superb anti-periodic and fortifying medicine as they are by no other preparation in use. Use it, and abandon impure local bitters.

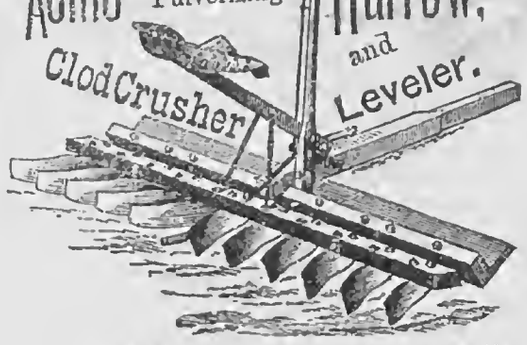
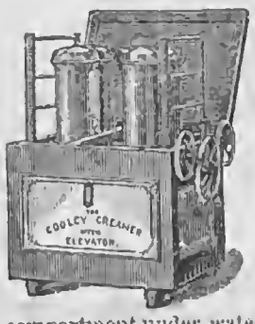
"Acme" Pulverizing Harrow, Clod Crusher and Leveler.



The *"ACME"* subjects the soil to the action of a *Crusher* and *Leveler*, and at the same time to the *Cutting, Lifting, Turning* process of double rows of
Steel Coulters
the peculiar shape and arrangement of which gives *immense cutting power.* The *entire absence of Spikes or Spring Teeth* avoids pulling up and scattering of rubbish. It is *especially adapted* to inverted sod, hard clay and "slough land" where other Harrows utterly fail, and also works perfectly on light soil. Send for circular.
NASH & BROTHER, Sole Manufacturers,
HARRISBURG, Penn. and 22 COLLEGE PLACE. NEW YORK CITY.

COOLEY CREAMER.
GOLD MEDAL, PARIS, 1879.



Butter made by this Process was awarded **Sweepstakes** at International Dairy Fair, 1878, and **Gold Medal** at same Fair, 1879
Gold Medal at Royal Agricultural Exhibition, London, 1879.
MANUFACTURED in FOUR STYLES and TEN SIZES.
THE REGULAR.—The cans in this, removed to bench for skimming automatically
THE JUNIOR.—Skimming done automatically without removing cans, THE UPRIGHT OR CABINET.—Has a compartment under water tank, the illuminated conical point of cans projecting into this compartment, skims without removing cans.
THE ELEVATOR.—Has a hoisting arrangement for raising cans out of tank. Milk drawn off automatically before removing cans form platform of elevator.
They require no milk-room. They raise all of cream between milkings. Impure air, dust or flies cannot reach milk set in them. The cans are submerged and water sealed in each style.
Each style has transparent panes for the purpose of determining when the milk is out, and cream about to flow. Our patents cover these processes.
No others have a right to use them.
Send for "DAIRYMAN" giving particulars.
VERMONT FARM MACHINE CO., Bellows Falls, Vt.

THE WOOSTER
CREAMERY
Perfect in Principle and in Operation.
Can be used with LESS ICE and LABOR than any other Creamery now in the market

CIDER PRESSES AND GRATERS,
BOOMER & BOSCHERT PRESS CO., Syracuse, N. Y

Try it once, and you will esteem it highly as a safe and effective remedy.

TROPIC FRUIT LAXATIVE
Prepared from tropical fruits and plants.
A MEDICO-FRUIT LOZENGE OF THE PREMIER CLASS.

Is the Best and Most Agreeable Preparation in the World

For Constipation, Biliousness, Headache, Torpid Liver, Hemorrhoids, Indisposition, and all Disorders arising from an obstructed state of the system.

Ladies and children, and those who dislike taking pills and nauseous medicines to secure cathartic action, are especially pleased with its agreeable qualities.

Packed in Bronzed Tin Boxes only.
Price 25 Cents, Large Boxes, 60 cents.
SOLD BY ALL DRUGGISTS.

APPARATUS & SUPPLIES
For Cheese Factories, Creameries, and Dairies.
Send for circular.
JOHN S. CARTER, Syracuse, N. Y.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XL. No. 12. WHOLE No. 1625. NEW YORK, MARCH 19, 1881. PRICE FIVE CENTS, $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

The Herdsman.

OUR ANIMAL PORTRAITS.

Jersey Bull Car Boy, 3351.

During the last decade it is very doubtful whether any breed of cattle have gained so much in popular favor and been so widely disseminated as the Jerseys. The richness of the cows' milk and the superiority of their butter have made them favorites alike with those who keep a single cow apiece to supply their own families with milk and butter, and with dairymen who are ambitious of obtaining top prices for gilt-edged butter from a select circle of customers who are willing to pay extra-high prices for an extra-fine product. Although there have been occasional importations of cattle from the Channel Islands for half a century or more, still, until a comparatively recent date, the herds of Alderneys, as they were then commonly miscalled, were confined mainly to the New England and a few of the eastern Middle States; and it is only within the last dozen years or so, that they have been largely introduced into the West and South. In view of the mild nature of the climate of their original home, in which the rigors of Winter common in the Northern States are unknown, the South should be especially congenial to animals of this breed, and we are glad, therefore, to notice that they are being widely disseminated from the Potomac and the Ohio to the Rio Grande and the Gulf. One of the choicest herds is that owned by Mr. John L. Hopkins, of Atlanta, Ga., known as the Edgewood herd, at the head of which is Car Boy, 3,351, the subject of the accompanying engraving.

While, as far as personal indications are concerned, more reliance can be placed on the appearance of the cow than on that of the bull, yet, since in establishing a herd, the bull is of vastly more importance than any single cow, even greater care should be taken in selecting him, the decision resting less on his own appearance and points—although these should have due weight—than on the character of his dam and both his granddams, for the cardinal principle of judicious breeding is that "like begets like or the likeness of some ancestor." In these points Car Boy should satisfy the most critical judgment. He was born on August 28, 1878, and imported in his dam, Queen Bess, of St. Brelades, 7,462. She is an excellent type of a Jersey cow and a prize winner both in the Island of Jersey and at the St. Louis Fair of 1878. His sire was Neptune 1st, a prize bull, and considered one of the best in the Island of Jersey. Neptune's dam, Mermaid, was a remarkably handsome cow, a deep milker and a prize winner. Car Boy is of a solid dark fawn color, with an amber stripe along the back, an exceedingly rich, yellowish skin, waxy horns and a highly promising escutcheon. As will be readily seen from the engraving, he is a very stylish, symmetrical and handsome animal. In 1879 he took the first premium, at Springfield, as a one-year-old, and last October he bore away the first premium as a two-year-old, and also the sweepstakes as the best bull of any age, at the fair of the Georgia Stock and Fair Association.

NOTES BY A STOCKMAN.

THE wise man remarked that he found three things that were too wonderful for him. Had he lived until to-day he would have found another he might have added to his list, "the way of a speculator in stock." Surely the ways of Wall Street have infected the stock business, and the shearing and fleecing processes of the railroad and mine gamblers have been adopted by the live stock speculator. I have often referred to the fuss made about "the coming sheep," and have tried to warn persons who have no money they can afford to lose, against being deluded by it. And now comes the last act of the little farce. As I prognosticated, these "coming sheep" have arrived, and an announcement is made that 44 head of newly imported Hampshire Downs, are to be sold at public sale. The "boom" is first made by outrageous puffing and by a process of "hippodroming" and prize taking, and then comes around the speculator to "rake the pot."

THESE splendid sheep—I admit they are magnificent, but they are fancy animals, breeders' and speculators', and not farmers' stock—will all wilt and die off miserably and in three years from now will be no more; but more victims will be forthcoming as long as there are greenhorns to fill the purse of the veteran importer.

FORTY-FOUR of "the coming sheep," recently imported, sold at Philadelphia for $2,500. This will hardly pay such a profit as will induce many importations, at least of high-class sheep. If this is all the "boom" that can be raised it will only pay to bring common animals, "ornery critters," in fact; and this is an additional reason why Americans should keep aloof from this sort of business.

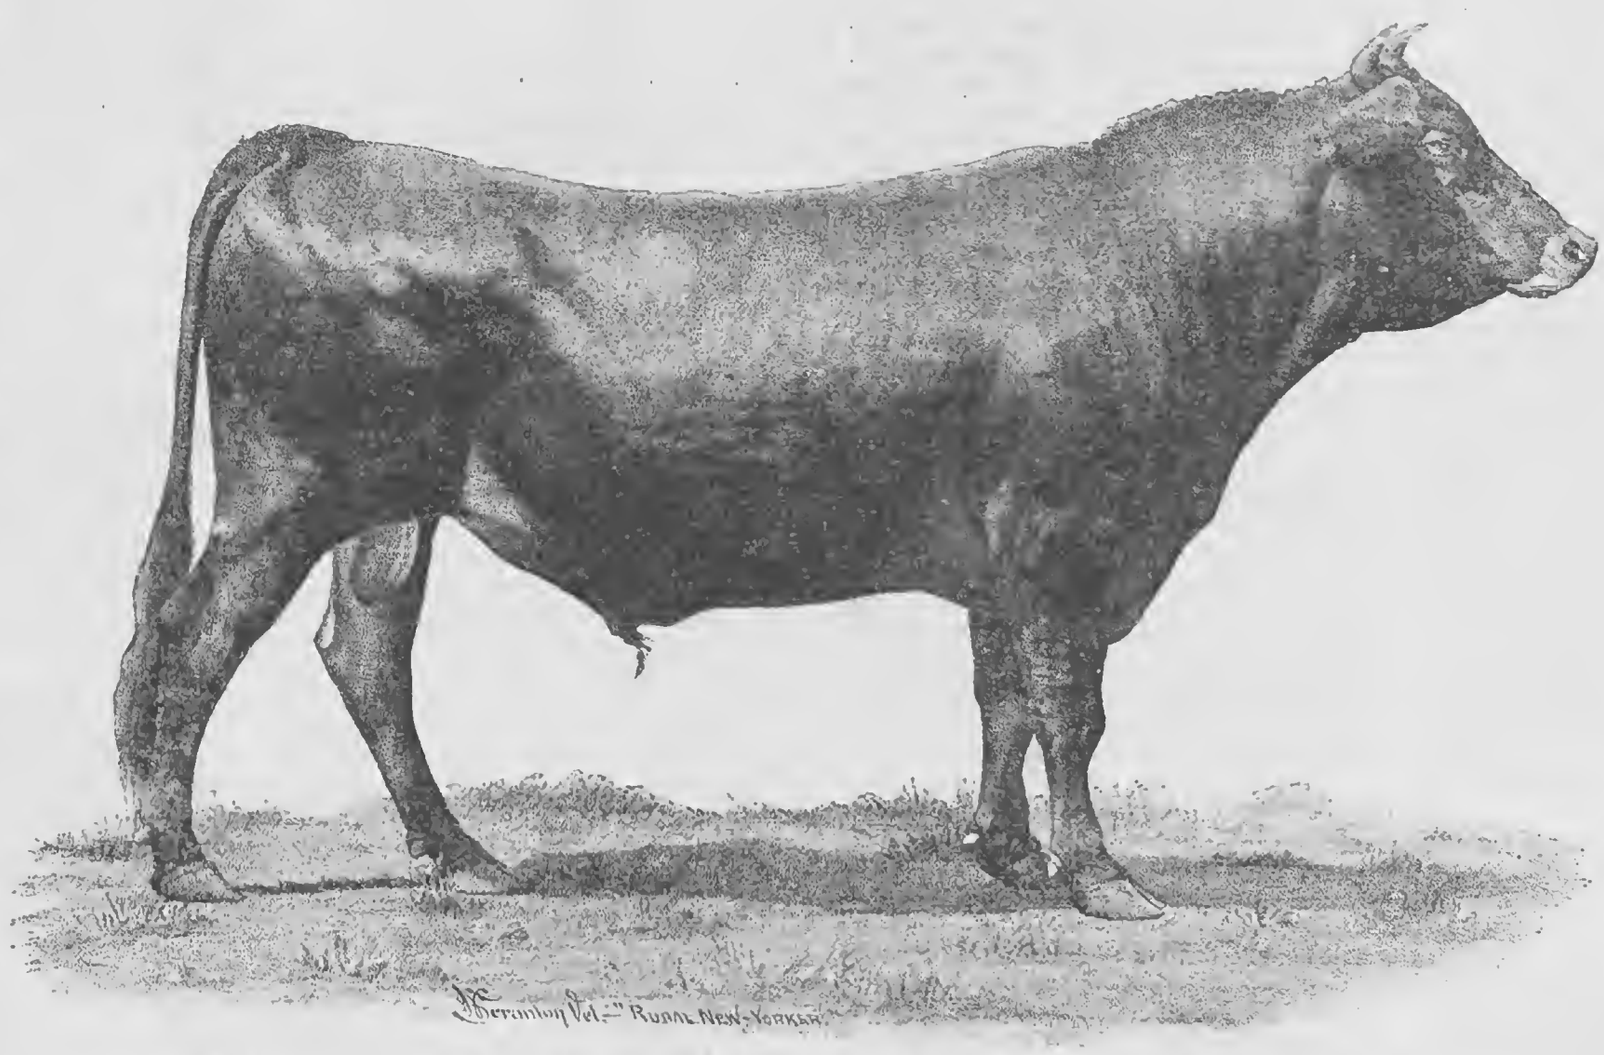
ONE of the strangest things is that farmers will not read and study the literature of their profession and will remain in ignorance of the very rudiments of it. What farmer possesses the few standard books which relate to the practice of agriculture? How few read an agricultural journal? and, alas that it should be said! how few of the agricultural journals are really trustworthy! This note grows out of reading a report of the Elmira Farmers' Club in which a person mentions a clear case of the well known black-quarter (carbuncular erysipelas), which was said to be caused by the freezing of the calves. Another person gives as a sure remedy for ticks, scab and other parasitic vermin on sheep, cattle, horses, etc., mercurial ointment, to be applied on the skin, "two streaks lengthwise and three around the body." Naturally enough, an objection was made against this remedy that it made the cows sick.

Now such crude, visionary attempts at information as these, were what brought the old New York Farmers' Club into disrepute and made a wreck of it. And they will destroy the usefulness of the very best farmers' club by weakening the confidence of the best and most intelligent of its members. It would be a wise thing to do to enlist the services of a competent professional man, as Dr. Law, of Ithaca, and refer these matters to him for advice. A little knowledge is a dangerous thing, but none at all is infinitely more dangerous.

BLACK-LEG is very prevalent just now, and carries off thousands of calves and yearlings every Spring and Winter. Imperfect digestion and blood poisoning are the causes of it, and either poverty or plethora will produce it. When the owners of cattle understand the principles of feeding and the laws of digestion and assimilation of food, they can prevent the occurrence of nine cases of disease out of ten which now happen. Further, if they have the knowledge that mercury is a poison and that animals will lick it off from the itching skin and so become poisoned, they will avoid applying it to parts that can be reached by the tongue, and use only such applications as will be safe.

GREASE is fatal to all insect life. Insects breathe by means of small pores on their sides. Grease or oil that comes in contact with the insects closes the pores and stops the breathing. Mercurial ointment kills as much by the lard in it as by the mercury—that is, so far as the vermin are concerned, but not as to the animals that lick it off from their bodies, so that almost any oily or greasy application will be destructive to insect vermin that infest animals, if it is applied where it will do the most good.

A PREVALENT and serious trouble with cows is abortion. This disease ruins many fine herds. Once it attacks one of a herd it goes through it, and much misapprehension is rife concerning it. Some lay it to dogs. This is an application of the proverb, "Give a cur an ill name and hang him." The dog has much to answer for, but not this. Yet a dairyman who keeps a dog deserves to suffer through his cows. But of this, more hereafter. Let us consider this disastrous disease. It is very clear that it is a contagious, parasitic disease. Pasteur has recently investigated it and has proved that it can be produced by inoculation by the special virus as easily as chicken or hog cholera, or small pox can be. This makes all clear and shows the way to prevent it. Occlusion, or complete separation of all infected animals, and the instant and thorough disinfection of stables are absolute means of prevention. Long-continued use of antiseptic medicines for cows that have been exposed to danger is desirable or necessary. The injection even of antiseptic solutions for pregnant cows may be useful. But when the nature of the disease is known, effective methods of dealing with it become mere matters of veterinary knowledge of remedies and their skillful application.



JERSEY BULL "CAR-BOY," 3351.—From a Photograph.—Fig. 152.

THE dairyman who has an aborted cow should carefully burn every part of the fetus; carefully cleanse with carbolic acid every place that has been fouled; remove the diseased cow to a distant stable; wash with thick lime and carbolic acid wash the floor, walls and stalls of the cow-house; fumigate the stable thoroughly with burning sulphur, and take as many precautions as he would if small pox or yellow fever had invaded his house. If this could become general, this disease would disappear or become very rare. It only leads astray and causes to grope in darkness to insist that it is caused "by the want of phosphates in the soil" (cows do not eat the soil, and crops cannot grow without their proper allowance of phosphoric acid), or by long-continued milking, or by dogging, or by slip-

pling on the ice, or mutual punching of th cows, or by high breeding, etc., etc., etc., to the end of the long list of the supposed causes. Some of these may, and often do, cause a cow to lose her calf, but only rarely, for a healthy cow will stand a good deal of abuse, but none of them ever caused the disease to become epizootic and to spread through a whole herd, and from that to other herds. The true cause is reasonable and simple and suggests prevention; the cure is impossible.

Lice on Cattle.

I see in agricultural papers many recipes for the destruction of these vermin, most or all of them doubtless effective, and I am not here going to praise or condemn them either individually or collectively, for I can say nothing by the way of experience concerning them. Not that my cattle and horses have never suffered from the pests; but because I have noticed the following facts which have suggested the remedy mentioned below:

Fact 1. Neither horses nor cattle are troubled with these parasites during Summer, when they can get to the ground. Fact 2. Horses delight to roll on the ground and always prefer naked spots where there is no grass. Why? Fact 3. Horned cattle like to rub their necks and shoulders (the places selected by lice) against any bank of earth and seldom omit to do so when any chance occurs. What for? I have noticed, too, that they like to paw in any loose earth and that in that case they do not throw the earth back behind them as a dog does, but that it often lights on their backs. Why is that? I have nothing to say about hens, all seem to know why they wallow and throw dirt over their backs. So I take the hint and when I discover any lice on cattle or horses, I rub earth on them (sand is the best) and strew it along their backs, and if one application is not successful I try it again, always in perfect faith that I shall succeed in the end because I always have. I supplement this with card or curry-comb. VIELLARD.

TO PREVENT CALVES FROM SUCKING EACH OTHER. — A correspondent writes us from Wallsville, Pa., that this habit lately referred to in the RURAL, is simply due to calf nature—the expectation of getting more food by sucking; so that when the supply in the feeding vessel is exhausted, the calf seizes hold of the ear or some other part of its neighbor thinking to obtain more food by sucking it; and the practice if allowed to be persisted in soon becomes a habit hard to be got rid of. The best preventive, he thinks, is to have the stanchions far enough apart to prevent the calves from reaching any part of each other, when their necks are tied in them, while they are feeding. Then if allowed to stand just so for a short time after eating or drinking they will scarcely ever attempt to suck each other.

Dairy Husbandry.

THE DAIRY COW—NO. 28.

HENRY STEWART.

Making Cheese.

THE process of making cheese is not only a mechanical one; it is also a chemical operation the nature of which has been very little understood, and even now we cannot say that sufficient is known about it to make it anything but a very uncertain one. From what has been said about milk (article No. 26) and rennet (article No. 27) it is very easily perceived that the rennet is the active agent in producing the separation or precipitation of the caseine of the milk from the whey; that the action of the rennet depends upon a certain organic element in it which is not well understood, and that this organic element acts by the production of a sort of inchoate, or undeveloped acidity which, however, is soon made active and apparent by lapse of time. This development of acidity in the curd is one of the most important changes which the dairyman has to control. All else is mechanical. To understand the process we will follow it step by step as practiced in an American factory.

The milk, either whole or skimmed, is heated to about 80 degrees. Sufficient rennet is added to bring the curd in 40 minutes to an hour. When the curd is firm enough to break, it is cut across in two or three directions, so as to make small cubes, which facilitates the separation of the whey. The whey usually separates in 15 or 20 minutes, by which time the curd has acquired a firm texture. The curd is then stirred with an agitator until it is well broken up, when heat is applied to the vat, and the temperature raised to 98 or 100 degrees. The broken curd is now well stirred, but carefully, lest the cream inclosed in the particles of curd might be lost in the whey. Just at this point the art and experience of the dairyman are taxed to seize the precise moment when acidity is about to develop itself, and before this occurs, the whey is drawn off. Then the curd is heaped in the vat and left to drain, while the acid develops itself gradually, until the curd becomes slightly sour to the taste. The modern practice of cheese making is gradually becoming more uniform in respect to the removal of the whey while it is still sweet, and leaving the curd in the vat to develop a moderate degree of acid before going to press.

After cooling 15 minutes the curd is turned over, by which it is exposed to the air and undergoes the requisite process of oxidation for the production of the desired acidity, and this manipulation is really the critical point in cheese making. If too much acid is produced the cheese lacks the mellowness and richness so desirable in a fine quality of product. If the whey is not sufficiently separated there is not only an excess of acid but often a more or less advanced degree of putrefactive decomposition in the cured cheese, which produces a very pronounced and sometimes very offensive odor, as in the case of that class of high-flavored and strongly odorous cheese of which the well known Limburger is a type. A great variety of cheese may be produced by different manipulations at this stage and by the after process of curing.

The common factory cheese, as now made, is put to press when the curds are cooled down to 60 or 65 degrees and before acid is plainly developed. After pressing for a few minutes to express the residue of the whey, the curd is broken up and ground in a curd mill, salted at the rate of two pounds to the hundred of curd and it then goes to press and is kept under pressure for two or three days.

The next process is curing the cheese. This is usually done in rooms specially prepared for the purpose, artificially heated and cooled, as the circumstances may require, and made with non-conducting walls and floors and amply ventilated. Here the cheese is exposed to a proper degree of heat to undergo a ripening stage during which the crude curd changes to a soft, buttery cheese which melts in the mouth and has acquired that peculiar agreeable, piquant and luscious flavor, which, with a certain solubility and easy digestibility, gives it so high a value as an article of food, if not of luxury. The usual temperature of the curing-room is 70 degrees; this is lowered or increased as may be desired to retard or hasten the ripening. The above applies to what is called full-milk cheese.

The high value of butter interferes very much with this manufacture and an enormous quantity of cheese is made of skim-milk, with the butter-milk worked up into it by the employment of a certain alkaline agent which neutralizes the acidity.

A vast amount of nonsense has been talked and written in regard to these manufactures. They have been called frauds and illegitimate. A common-sense view of the matter is to be taken. Is it better to waste a large quantity of skimmed and sour milk, produced in butter making, or turn it into a wholesome article of food that meets a certain popular demand? There is but one answer to this question. The cream of the whole milk has been replaced to a large extent in this manufacture with a preparation of animal fat known as oleomargarine. This is a limpid, yellow oil perfectly odorless, and when honestly made is of perfect purity and devoid of any objectionable quality. A sufficient portion of this oil is mixed in the vat with the skimmed milk until a perfect emulsion is formed. The after process is precisely the same as for pure milk. Buttermilk or sour skim-milk cheese is made by a different process.

In a former article it has been stated how the acid of sour milk may be neutralized by means of an equivalent amount of alkali. It may be worth while to repeat something of the process of curdling (souring) milk and of neutralizing this effect. The caseine of milk is insoluble in water, but is soluble in a weak alkaline liquid. Fresh milk is slightly alkaline and contains an excess of soda with which the caseine is in combination. When milk sours, the lactic acid produced by the decomposition of the milk sugar takes the soda from the caseine, forming lactate of soda, and the caseine is precipitated in the form of curd. The caseine is an acid substance always ready to unite again with an alkaline base. If a small quantity of soda or potash (common saleratus is bi-carbonate of potash) be added to the sour milk, the precipitation of the caseine is prevented and it is again dissolved, because the acid is neutralized and combines with the alkali. The milk is again sweet. No injurious product has been formed. Precisely the same action has taken place which occurs when saleratus and sour milk or buttermilk are used for making cake or biscuit. All the talk about the heinousness of this method of making wholesome cheese from an otherwise waste product of the dairy, at the recent dairy meetings, is simply cheap and sensational nonsense. Just as valid objections might be made to the use of salt—an alkali soda combined with chlorine, of itself a highly poisonous substance—for the purpose of preserving cheese from putridity, as against the use of an inoffensive carbonate of soda or potash to prevent the very same effect. The alkali is used to prevent the formation of an acid gas in the cheese, which would cause it to swell, heave or "huff" and so destroy its value as food. This gas is a product of excessive acidity in the curd and is frequently produced in full-milk cheese that has been badly made.

In making sour milk cheese the alkaline preparation is added in sufficient quantity to neutralize the acid after the milk is heated to 82 or 84 degrees; the rennet is added in the usual manner and the whole process goes on as with whole-milk cheese. By this process an enormous economy is gained and a vast amount of milk is saved from waste, and utilized as human food of a wholesome and nutritious kind. By the modern improvements in setting milk for cream the skimmed milk is usually kept sweet and only the buttermilk is sour; this is usually added to the sweet skimmed milk in the proportion of one-tenth.

Field Crops.

NOTES FROM THE RURAL FARM.

Potato Experiments.

THE following experiments were made to ascertain what distance apart potato seeds, cut to single eyes, should be planted in order to produce the best yield of marketable potatoes. Each test row was 33 feet in length; the variety planted was Beauty of Hebron. An old sod was plowed under in the Winter of 1880. The land was well prepared last Spring. The seed pieces were placed in shallow furrows, three feet apart, May 18, and upon them a slight sprinkling of concentrated potato fertilizer was spread. The earth was then hoed back so that the entire plot was quite level. The same fertilizer at the rate of 300 pounds per acre was afterward spread broadcast, just previous to the first cultivation. The potato beetles were destroyed by the use of London-purple, using a tablespoonful of the purple to a half-bushel of plaster, thoroughly intermixed. We have found that the quickest and most effectual way of mixing the poison with plaster or flour is to spread the latter say two inches deep over a tight floor; then spread the poison over the surface and mix with an iron-tooth rake. A half-barrel at a time may thus be prepared. That the yield was light in every case was no doubt due to the fact that the season was very unfavorable to the potato crop, being very dry in the early and too wet in the later part. We have to regret that the information to be obtained from the results of the experiments is by no means proportionate to the labor and time spent in conducting them.

ONE EYE IN A PLACE—ALL THE DRILLS 33 FEET IN LENGTH.

18 pieces, weighing 12 ounces. Yield, 24 pounds.
(18 pieces in a drill 33 feet long would be 22 in. apart.)
20 pieces, weighing 14 ounces. Yield, 14½ pounds.
(This row was harmed by moles.)

25	pieces, weighing	14	ounces.	Yield,	35½	pounds.
28	" "	14½	"	"	26¾	"
30	" "	18	"	"	21	"
33	" "	23	"	"	24	"
40	" "	23	"	"	20	"
49	" "	26	"	"	28¾	"
66	" "	32	"	"	31¾	"

TWO PIECES, EACH HAVING BUT ONE EYE, PUT CLOSE TOGETHER IN DRILLS 33 FT. IN LENGTH.

40 pieces, weighing 22 ounces. Yield, 24½ pounds.
(Nearly 10 inches apart.)

50	pieces, weighing	24	ounces.	Yield,	27	pounds.
60	" "	28	"	"	24½	"
66	" "	34	"	"	25½	"

THREE PIECES (SINGLE EYES) PUT CLOSE TOGETHER IN DRILLS 33 FEET IN LENGTH.

48 pieces, weighing 22 ounces. Yield, 18 pounds.
(Injured by moles.)

75	pieces, weighing	40	ounces.	Yield,	30	pounds.
90	" "	42	"	"	24	"

The average size of the last was much smaller than any of the others.

FOUR PIECES PUT CLOSE TOGETHER IN DRILLS 33 FEET LONG.

64 pieces, weighing 33 ounces. Yield, 24 pounds.

FIVE PIECES CLOSE TOGETHER. DRILL 33 FEET.

80 pieces, weighing 36 ounces. Yield, 27 pounds.

POTATO SKINS CUT TO SINGLE EYES.

May 26 we planted in well-prepared ground 37 pieces of potato skins—each having a single strong eye—six inches apart in the drill. The 37 pieces weighed two ounces. Three grew, and the yield was half a dozen potatoes as large as marbles. The experiment was made to test the value of a positive assertion on the part of a "well-known" farm writer that such eyes would yield as well as those to which flesh is attached.

Yield of the White Elephant.

In a plot adjacent to that in which the foregoing experiments were made, and treated in the same way, we planted the White Elephant. The plot was 66 feet long and 27 feet in width, or a little over 1-24th of an acre. They were planted in nine rows 66 feet long, cut to single eyes, and one piece dropped about every 22 inches. They were planted May 11. The yield was 697½ pounds.

The Yield of New Seedling Potatoes.

One of our prominent seedsmen sent us about 30 kinds of new seedling potatoes to test. Some of these have this season been offered for sale. All of them were represented by their originators as improvements in some or all respects over those at present known in commerce. As our test was made chiefly to ascertain their comparative productiveness, we need present them only by the original numbers:—

TOBACCO CULTURE.—NO. 3.

G. A. GOFF, JR.

Management of Tobacco Beds.

THERE is no other point in growing a crop of tobacco so important and so difficult to perform, as raising the young plants. It is the point where most failures occur, for the reason that it requires so much care and watching. It will not do to depend on one's neighbors for plants, as they are rarely willing to part with them until their own wants are supplied, after which the best opportunities for setting are past, and the remaining plants in the bed are small and weak. Inexperienced tobacco growers need to be reminded that during nearly half of the period from the sowing of the seed to the time for harvesting the crop, the plants remain in the seed-bed, and during that interval, being very small and tender, they require much more care and attention than during the last half of their growing lives. Inefficient hired help can hardly be trusted in caring for the plants without the supervision of the grower, and our most successful growers give to the work their personal attention.

After the plants are started nicely in the seed-bed, the chief dangers of failure are from burning, drying up, and the depredation of insects. The former two perils can be remedied by exercising sufficient vigilance; the last danger is more difficult to manage. The most troublesome insect that preys upon the young plants is a small fly or flea, which sometimes causes much loss. Various means are used to stop its depredations when it appears, as applying ashes, plaster, soap suds, guano water, etc.; but these are of little avail, only in so far as they strengthen the growth of the plant. A better and more effectual remedy is to place a hen with chickens a few days old, in close proximity to the plant bed, when the young chicks will aid greatly in destroying the insects. Weeding the plant-bed must begin as soon as the weeds are large enough to pull. It is a slow and tedious task requiring much patience to perform it well. A board is placed across the bed and upon this the weeder lies, face downwards, a position which allows him to get close to his work, without treading upon the bed. The expense required to weed a tobacco bed depends largely upon its management. If weeds are allowed to scatter their seeds upon it while it is not occupied with plants, the work of weeding is much more laborious and costly. For this reason no weeds should be allowed to grow in the bed at any time during the year.

Tobacco plants forced by the use of glass are always more tender than those grown in the open ground. In order to toughen them so that they will bear transplanting without much loss, the glass should be dispensed with a week or ten days previous to the time of setting them in the field. Early tobacco plants should be large enough to set by the first part of June. Nothing is gained by setting small plants, they should have leaves at least two inches long.

Fitting the Ground.

While the plants are growing, the soil where they are to be set should be fitted to receive them. The soil is usually plowed twice in the Spring, once early and again just before setting time. When the soil has been properly prepared by the use of the plow, harrow and roller it is marked one way, in rows three feet and a half apart, with a common corn marker. Sometimes the plants are set on a hill or "spat" made with a hoe; but the more popular method at present, as it saves much labor is as follows: a ridge is formed over each mark with a plow or cultivator. The Alden hill cultivator is the best implement for the purpose that we have found, and is the one generally used. The center teeth are removed leaving only the two outside ones, which are so arranged as to move the earth inward, thus forming a ridge. The ridges are then passed over with a light roller, on the outside of which are fastened narrow cleats which serve to mark the points where the plants are to be set. The roller commonly used for this purpose is made in two parts, each two feet long and about the same in diameter. These are hung in a frame far enough apart so that two ridges may be rolled at once. Thills are at-

tached to the frame so that a horse may walk between the rows. The plants are usually set about 20 inches apart in the row. The rollers, therefore, should be about five feet in circumference, having three cleats fastened at equal distances.

SOME OF OUR GRASSES.

PROFESSOR W. J. BEAL.

It is a good sign to hear farmers begin to inquire about the qualities of different grasses. Some of them have already found out that there is something worth raising besides Timothy and red clover. Prominent reasons why farmers have not paid more attention to other grasses are these:—There are so many kinds it is difficult to learn to recognize each, especially since they vary much at different seasons and in different soils. A mere description with the name is often of little value to a majority of people. Excellent illustrations with the descriptions are far more valuable, and we cannot help complimenting any journal which shall often produce good cuts of grasses.

This is a subject which has just begun to attract attention in this country. We should have a thousand students where we now have one who can recognize our grasses at sight. To learn to do this, requires considerable application. After a good understanding of the structure of plants and flowers, as usually studied in schools, one should analyze and preserve specimens in a herbarium, and preserve bunches of each grass by themselves. This should be followed up for a whole year.

The student will need much practice before he can learn to recognize all the grasses in any neighborhood, many of which will contain 50 to 80 native species. No person will ever regret the time spent in acquiring an accurate knowledge of grasses. The training is worth all it costs, and to many it will be of great value in other respects.

Orchard Grass—Cock's-foot—Dactylis glomerata.

This grass has often been mentioned by the press, but many are yet ignorant of its virtues and peculiarities. It has long been well and favorably known as one of the best forage plants in Great Britain and some other parts of Europe. Its reputation in the United States is quite variable. Some who know it well and have raised it for years, think there is no better grass for pasture or meadow. It is emphatically a grass that is sensitive to extra treatment. On poor, thin soils, the crop is small; on rich soils, heavy. The grass grows in bunches and looks rather coarse. It will not spread and make a thick, handsome turf. It starts very early in Spring, and very soon after it has been mowed or eaten off. Stock of all kinds are fond of it and thrive on it. If sown alone, about two bushels of seed in the chaff are used on an acre. The plant flowers quite early—about the same time as red clover. It will grow on sandy soil, or on clay, or on loam. The hay, when cut at the proper time and well-cured, is of excellent quality. If left to stand, even a few days after flowering, the stems speedily become woody and the hay will be of poor quality. It is usually ready for mowing before the farmer gets ready. He delays—and the grass is condemned because the hay is poor. Orchard Grass has been found to be one of the best for meadow or pasture for the dry, fertile plains of Kansas and Nebraska. Unlike Timothy or clover, it will stay on the land ten years or more. It is often spoken of as admirably adapted to growing in the shade; but it is no better for this purpose than June Grass. Both are of much better quality when grown in open spaces fully exposed to the sun.

St. Patrick and Burbank Potatoes.

Are these the same? Having seen a note in the RURAL in which a correspondent says that he thinks them the same, I will say that the time of ripening of both is nearly the same. The Burbank I consider the stronger grower and probably the better yielder. Ours were grown about ten feet apart, the rows running the same way. On comparing them I now find that nearly all the Burbanks have a russet coating, with a yellowish cast. The St. Patricks are almost smooth, and a shade whiter. It would take a very good judge to tell these varieties apart, if they were thrown together. When cooked I find the St. Patrick at least good, while the Burbank is not more than fair in quality, both boiled in the same pot. There is more difference between these varieties than between many others. Our St. Patrick came from Peter Henderson & Co., and the Burbanks from B. K. Bliss & Sons, and both were probably correct to name. The St. Patrick may become popular; the Burbank must go out.

Titusville, N. J. I. J. BLACKWELL.

SPRING AND FALL WHEATS.—I see inquiries in the RURAL in regard to changing Spring wheat into Fall wheat, and I would say that it is no uncommon thing for a Nebraska farmer to sow the same sort both in Fall and Spring out of the same bin, and raise a good crop from each sowing. The variety thus sown is the Grass or Odessa wheat. I have myself raised 28 bushels per acre of this wheat sown as a Fall wheat, and at the same harvest I have cut 20 bushels of the same as a Spring wheat. J. H.

Tekonsha, Neb.

Farm Topics.

ENSILAGE.

I HEREWITH send you some extracts from Professor G. H Cook's lecture on ensilage before the Somerset County Agricultural Society, delivered at Somerville, February 19, 1881.

Ensilage means green fodder of any kind preserved in a cellar. The word is taken from the French. It is no new theory, except in its application. The same principle is embodied in making saur-kraut. The green corn is taken from the ground at the time of tasseling; put through a cutting machine, cutting it into about half-inch pieces. It is then put into pits or silos made water-tight, as quickly as possible, and packed therein by men, mules, or oxen, and a tight covering having been made to exclude the air, it is weighed down with some convenient material. It has succeeded admirably well at the College Farm.

He gave the names of Francis Morris, Oakland Manor, Howard County, Maryland; Mr. Buckley, Port Jervis, N. Y., Messrs. Whitman and Burrell, Little Falls, N. Y.; Messrs. Coe, Bro's., Meriden, and B. C. Platt, Suffield, Ct.; and Dr. J M. Bailey, Billerica, Mass., as having sent well-preserved samples to the station showing that if the work is properly done, it is a perfect success. He mentioned Jas. Lippincott, Jr., Mount Holly, Burlington County, and C. W. Mills, Pompton, of our own State, as having also succeeded with it.

He had visited Mr. Mills and learned from him that he had eleven acres of corn and was using it for Winter fodder. He had an old barn, and, having built a partition wall through the middle of it, he had constructed two silos, each twenty feet deep, thirteen feet wide and forty feet long. He had cut up all the stuff from the eleven acres and filled the pits with it. He had a frame built perpendicular with the sides of the pits 15 feet above the barn floor; filled it; put a tight cover over it and weighted the contents with bags of wheat screenings. He had kept 120 head of cattle, including 40 milch cows and 12 head of horses. He began feeding from the silos last October and had fed up the fodder in one silo, and would have enough to last until Spring. Dr. Cook said his cattle looked well; Mr. Mills estimated the weight of green stuff from the eleven acres at 600 tons, the ensilaged fodder costing him a sum total of $500.

Ensilage had been tried as an experiment at the College Farm. The silo there holds 15 or 20 tons, and it is a perfect success as far as the preservation of green corn is concerned. Rye cut in the milk, clover, Hungarian Grass, brewers' grains, etc., might be preserved in the same way with equal success. The stock ate it better and seemed to relish it more than the dried corn-stalks. He said it is possible for a change to occur in ensilaged fodder enhancing its nutritive qualities.

For example, Winter apples were more nutritious in the Spring than when put up in the Fall. Wood might be changed by chemicals into starch or sugar, nothing having been taken from or added to it except the necessary chemicals. Glucose from corn sold in the market as pure bee honey. Ensilaged fodder, when taken from the silo, had a strong alcoholic taste and smell, and it should be taken from the pit 12 or 18 hours before it is to be fed. He found that after having been left in a heap for two or three days, it smelled and tasted like vinegar. Cows do not need as much water when fed ensilage, because it contains from 80 to 82 per cent. of water. Cows fed at the College Farm were given nothing but ensilage and cotton-seed meal in the way of economy. The experiment was not yet concluded. PENN.

ORCHARD GRASS—COCK'S FOOT—DACTYLIS GLOMERATA.—FIG. 153.

Ensilage.

There is nothing that interests practical farmers hereabouts so much as ensilage of green fodder, and there is no way in which so much good can be done in so small a space in the RURAL as by telling us about the successes as well as failures of this system, and giving directions for building, managing and filling the silos. I wish to build one the coming Spring; but do not want to start unless there is an assurance of success. Now is the time to make our arrangements if we are to have success this year, and all information on the subject would therefore be especially acceptable. If the system proves such a benefit as we have been told by some of its advocates, it will help the Eastern farmer to hold his own with the Western dairyman.

Plymouth, N. Y. W. B M.

REMARKS.—The RURAL is watching the subject very closely. It is because we still entertain doubts as to the value of the system that we hesitate to commend its adoption. Better delay a year than to build costly silos to be abandoned after a few years of trial. We have on several occasions referred to all the books or pamphlets that have been published on the subject.—EDS.

FEEDING TRIALS AND DAIRY PRODUCTS.

CONRAD WILSON.

AMONG the valuable experiments of the last few years there are some that are highly creditable to their authors, as well as greatly encouraging to farmers, and it is gratifying to find also that some of our agricultural colleges have lately turned their attention earnestly in this direction. The instructive pamphlet of trials and results lately received from Conductor Sanborn, of the New Hampshire College Farm, abounds with facts and figures of more than usual interest and clearly shows the value of this kind of work.

In one series of these experiments, continued through 70 days, each separate trial comprised a pair of two-year-old steers, grade Durhams, of nearly uniform weight. The feeding ration for the first lot was swale hay, 2,496 pounds, and cotton-seed meal, 560 pounds; making the total feed a little over 1¼ ton. The increase of live weight from this feed was 167 pounds, at a cost of $15, with a manurial result equal to $12.80, which made the net cost of the feed over the value of the manure equal to $2.24. From this it appears that the net cost for gain of flesh during 70 days was only

Two Cents per Pound.

This result plainly indicates the value of cotton-seed meal both as an economical flesh builder and as a source of rich manure.

In the second lot, the feeding ration was hay only, and amounted to 3,536 pounds. The gain of live weight was 135 pounds, in 70 days, at a cost of over five cents per pound. The evident lesson from this trial is that the daily ration cannot safely be limited to a single kind of food, whatever may be its nutritive value.

In lot No. 3, the ration consisted of corn meal and straw, amounting together to 2,770 pounds, with a gain of 120 pounds of beef, costing four cents per pound. The point here to be noted is the obvious fact that the proportion of corn meal per day was evidently too small to ensure the best result; being only five pounds a day for two steers. If the meal given had been five or six pounds for each animal, the cost of the beef would doubtless be less per pound, and with a larger increase of live weight.

Now, if these three trials are taken together, the average cost of the increase is less than four cents per pound. If the average of the 1st and 3d is taken, it is less than three cents. While in the 2nd trial with only one kind of feed (meadow hay), the cost of increase was over five cents.

Without stopping at present to examine all the results of this series, it is perhaps enough to say that in the 5th trial, with a ration of straw, blood and corn meal, the cost of beef was 3½ cents a pound, while in the 6th and 7th trials, with a daily ration of clover rowen and oat straw, the cost per pound for increase was less than two cents.

It thus appears that the *final average of six trials* shows a result of 145 pounds of increase for each trial of 70 days at a cost of three cents a pound for the beef.

Experiment of Prof. E. W. Stewart.

In a very interesting feeding trial as formerly conducted by Prof. E. W. Stewart, for testing results in milk and butter, the daily ration adopted for the purpose consisted of hay, bran, ground peas and oil meal, amounting in all to 16 pounds. With this ration, when given raw, it was found that the product of butter was less than five pounds per week. From the same ration when cooked, the yield of butter was eight pounds per week, and of milk 16 quarts per day. It was also found that an addition of two pounds a day to the cooked ration gave an increase of two pounds of butter per week.

Though this trial was chiefly intended to show the difference between cooked feed and uncooked, yet the results obtained for this point, do not by any means exhaust the experiment, which, while it sheds some light on the steaming of food, is also very suggestive for other questions equally important.

We find, for example, that the feeding ration in one case produces over two pounds of milk for each pound of feed, and further, that when two pounds of feed are added, as above mentioned, to the daily ration it means

Four Pounds of Milk for one Pound of Feed,

and one pound of butter for seven pounds of feed. Now all these figures are full of instruction, and still we have not yet reached the full measure of this well devised experiment. If all the factors belonging to it are duly examined, it will be easy to see that they shed a new and striking light on the cost of production for butter, and on the rate of profit in the dairy.

When, for instance, a feeding ration of 16 pounds per day is increased to 18 pounds with a resulting yield of butter amounting to 10 pounds per week, and of milk amounting to 280 pounds, it is clearly safe to say that the yearly result for butter in such a case can hardly be less, but would probably be more than 350 pounds, which at 25 cents would amount to $87 a year, and further, that the cost of the butter would not exceed five cents per pound, while the net profit per cow would be over $70 a year.

But one of the points in this experiment is too remarkable to be dismissed without further elucidation. The ratio of the feed to the milk and butter it produces, as referred to above, is in fact, a pivotal question in every dairy and on every farm. In this connection some additional light may, perhaps, be gained from recent investigations in Germany. In a series of elaborate experiments

At the Academy of Eldena,

this ratio was found to be, in the case of hay, when used alone, about 2½ pounds for one pound of milk. In another series of trials, Villeroy found the average to be a little less than this, but still over two pounds for a pound of milk, and in another case nearly three pounds of hay were required for one of milk. Yet in the experiment now under consideration, it was shown that the nutritive effect of hay in one of the rations was four times greater than in the German experiments, and in another ration the contrast was larger still.

In other words, it was shown, in one of the combinations of Prof Stewart, that the hay, which amounted to 10 pounds, and which, if fed alone, would give, according to European investigations, less than five pounds of milk, produced in this case 20 pounds, and in another combination more than 22 pounds.

Somewhat similar to the above, and no less instructive to farmers, is the suggestive and fruitful experiment of Professor Geo. H. Cook, as recently announced in the bulletin of

The New Jersey Experiment Station.

The cows in this trial were mixed grades, six in number, taken from the college herd of 24 head. The chief object in view was to determine the true proportion of several different feeding elements for the best yield of milk. For this purpose the following daily ration was computed by Professor Cook, and tested for 30 days.

Clover hay, 6 pounds; wheat straw, 13 pounds; brewers' grains, 20 pounds; turnips, 20 pounds; cotton-seed meal, 3 pounds. The average weight of the cows was nearly 1,000 pounds, and the average yield of milk during the trial was about 23 pounds per day for each cow. This rate of yield during 30 days (even if the year is counted at only 300 days), would make the annual product of milk about 7,000 pounds per cow, which at 2 cents a pound would amount to $140.

Now this result was not the mere product of a single cow for a day or a week; but the average for a trial of 6 cows for 30 days; and shows that the feeding ration here computed for milk, though not the best perhaps in all cases, is yet a safe and reliable guide that can hardly fail to give good results, and under favorable conditions, an unusual profit.

Though the main purpose of the experiment is thus well accomplished, a little further examination may perhaps disclose other results equally possible and no less interesting.

If we assume the ratio of milk to butter in this experiment as 25 pounds to 1 pound, (which for good cows is a low estimate), it would make the butter product per year equal to 280 pounds per cow, which at 30 cents a pound would amount to $84. Then if the manure and the skimmed milk are duly credited at their true value, the result will show that the net cost for the butter is less than six cents per pound, and the net profit per cow nearly $70, per year.

Without implying any doubt of the soundness of the above feeding ration as computed for milk, I venture to suggest that, when the object is butter, the result would probably be improved by the following slight changes in the formula. Clover 8 pounds, straw 12 pounds, brewers' grain 20 pounds, turnips 15 pounds, cotton-seed meal 3 pounds. Then if the clover, straw and turnips are charged at the *actual cost* to the farmer, the expense of this ration should not be over 17 cents per day, which would make the results for butter more favorable than the above figures.

It was intended to notice here the remarkable success of ex Governor Boutwell with his herd of 40 cows, and the still larger herd of *native* cows owned by Ladoc Pratt, in both of which are to be found some new and striking points of interest. But time is at present too limited, either to enter upon new topics, or extend the discussion of those in hand.

Entomological.

THE ASPARAGUS BEETLE.

The Asparagus Beetle (Crioceris asparagi) has long been an enemy to the asparagus crop in Europe; but its ravages have not been very widespread in this country until quite recently. Since 1862 this insect has been spreading slowly through New York, Connecticut, New Jersey and Pennsylvania, and during the past year the worst reports of its injuries have come from Burlington Co., N. J., where it is said to have destroyed 25 per cent. of the market crop. The accompanying cut, fig. 155 represents a beetle, its larva, and a portion of an asparagus sprout, showing how the eggs are deposited upon it. As will be seen, they are invariably placed endwise upon the plant.

The life history of this beetle may be stated in a few words: Upon the appearance of the plant in Spring the little pests, which have been passing the Winter under stones, old pieces of wood, the scaly bark of trees, etc., come forth, and, finding their way to their favorite "pastures" very readily, they begin at once to gnaw the tops of young plants. They soon pair and the females deposit their eggs, which are oval in form and nearly black in color, and placed, as shown in the cut, in rows of from three to seven each. In about eight or ten days the larvæ appear, which in form are much like the potato beetle, though different in color.

ASPARAGUS BEETLE.—FIG. 155

"The larva," says Professor Fitch, "moves very slowly, and is shy and timorous. As you approach it, it stops eating, and, holding its head stiffly back, it emits a drop of black fluid from its mouth. This appears to be its only defense against being devoured by birds and other predaceous animals, the acrid taste of the fluid rendering the larva unpalatable to them." The larva attains its full growth in about 12 days, then it descends to the earth, and, after spinning a slight cocoon, is transformed to a pupa, in which state it remains about 10 days. The perfect beetles are beautiful in appearance. The head, under side of the body, antennæ and legs are a shining black; thorax, reddish-brown, with two black marks in the center; wing-covers, light lemon-yellow, with a border of orange-yellow around the whole. When full-grown, the larva is about a quarter of an inch in length.

Among the remedies suggested for the ravages of this little pest, hand-picking is surest, but this can be practiced to advantage only where asparagus is cultivated on a small scale. Lime may be dusted on the larvæ in the morning when the dew is on, for then it will adhere to the plants as well as to the larvæ, and during the day it will be brought in contact with the latter more or less. When asparagus is raised in large quantities for market, all "volunteer growth" should be destroyed in the Spring, thus forcing the mother beetle to lay her eggs upon the market shoots, which are cut so often that the eggs will not have time to hatch.

Potato Bugs.—A singular circumstance respecting these pests occurred last Fall at Pine Hill. A gentleman was digging a well, and after he had dug through the hard-pan, which was very hard, he came to a layer of blue gravel, some seven or eight feet below the surface of the ground. Firmly imbedded in this gravel, like little stones, were multitudes of potato bugs. Upon loosening this dirt the bugs crawled around as lively as though just coming from the potato vines. Water was filtering through portions of the earth on a level with them. The mystery is, where did they come from and how did they get below the hard-pan? W. M.

To Destroy the Tent Caterpillar.—My plan for destroying the Tent Caterpillar is to take a shot-gun; put in a charge of powder without any wad; hold the muzzle of the gun about two feet from the nest and—"let drive." This plan I have tried for the last ten years and I can therefore speak well of it from experience. J. B.

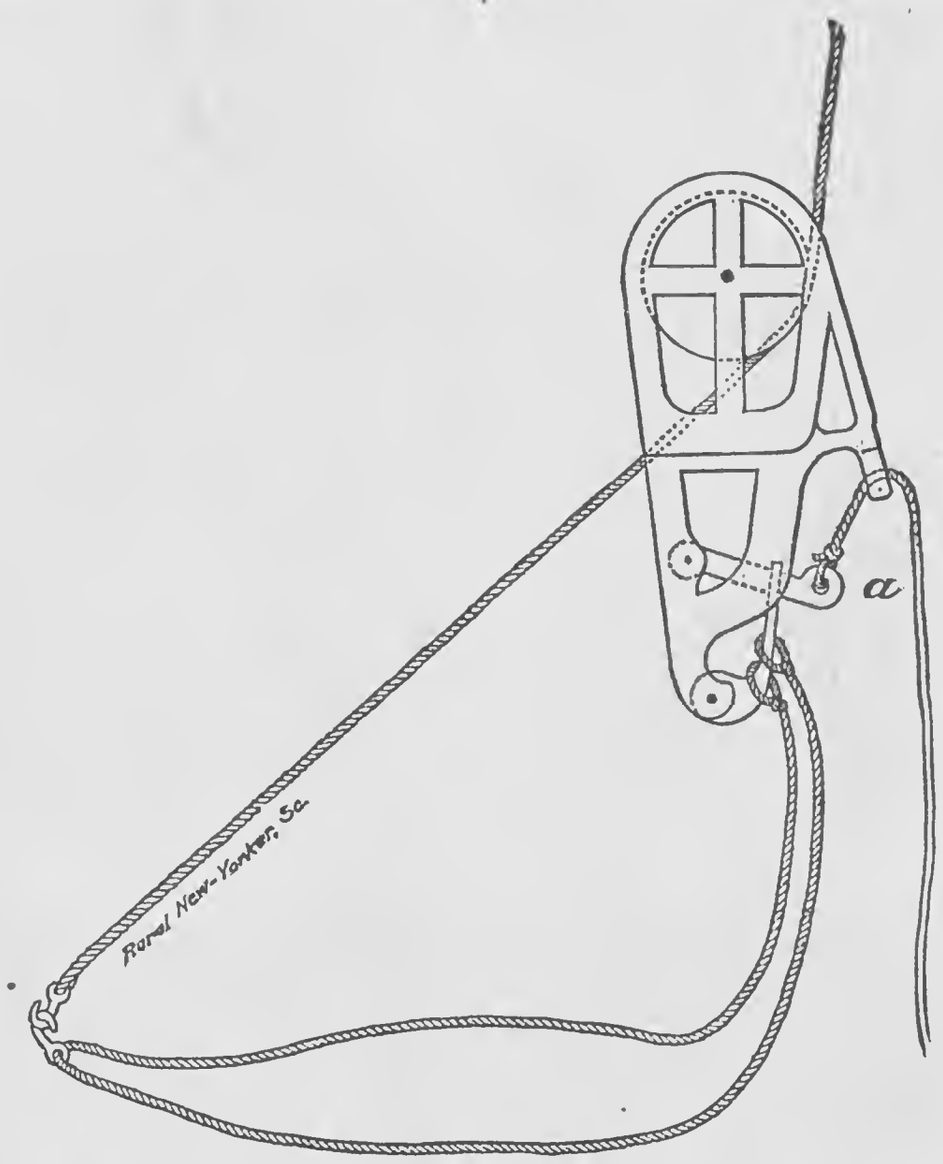
[Isn't it rather an expensive plan? Eds.]

Farm Economy.

HAY-SLINGS.

PROFESSOR I. P. ROBERTS.

Many inquiries have been made about the construction and working of the hay-slings referred to in my article on hay barns, published in the Rural for February 5th. The sling consists of a rope about five-eighths of an inch in diameter, to either end of which is attached a ring about two inches in diameter. The middle is furnished with a small casting resembling two links of a chain made rigid. The rope is laid on the hay-rack double, and about as far apart as are the two standards of the wagon. The cast double-link in the middle of the rope is usually placed on a hook fastened in the forward standard of the hay rack; the rings at the ends of the rope are placed on a hook fastened in the rear upright standard of the rack. So far, with the exception of the iron fixtures, it is a long rope, placed just as any farmer's boy would place a short one on the barn floor if he wished to carry a bigger load of straw than his arms would encircle. Upon this rope are placed from five to eight hundred pounds of hay, straw, wheat, corn-stalks, bound or unbound, or even barrels of apples or sacks of grain. A second rope is then placed upon the hay or grain, already loaded, and when another five to eight hundred pounds have been loaded, a third rope is placed upon it, and so on, using four slings for a load of two or three thousand pounds.



HAY SLING.—FIG. 154.

The Snatch Pulley.

A common cast "sheive" is surrounded by a cast frame like an ordinary pulley, except that the frame is about six inches longer one way. Upon the end of the extended frame is a snatch hung upon a pivot upon which are hooked the two large rings on the ends of the rope. To make it more plain to yourself, place the open hand with the palm up; imagine two large rings put upon the fore finger; bring the end of the first finger against the center of the ball of the thumb; imagine a small hole in the ball of the thumb and a spring pressing upon it. Then suppose a trip rope to be attached to the thumb-nail and to pass through an opening a little above it. This gives a clear idea of how the sling is emptied. To the end of the large or pulling rope is fastened a small hook; the rope is passed through or under the sheive, carried forward and hooked into the double link in the middle of the sling-rope, which contains the load. As the horses draw, the large rope is pulled through the pulley block until it comes to the hook and links which connect the large rope with the sling rope; these as well as the double sling rope pass through and continue to shirr until the pressure is equal to the weight of hay, at which time the hay rises. The pulley unlocks the car; the load then moves horizontally. The car differs little from those used in connection with the horse-fork, except that it will run on a track deflected sidewise.

Situated at the ends of the tracks in the center of the barn is a turn-table, which is shifted, locked and unlocked from the floor by a cord. I am using the hay sling in two barns, one of which not only has a track running the entire length, but also two running at right angles with the first, and three running into the corners. By having many tracks, one man in the mow can take care of all the grain or hay that three teams can draw.

Last harvest several loads of wheat and hay which weighed 3 000 pounds and upwards were taken off with four slings. It is from twelve to fifteen minutes from the time the load approaches the barn until the wagon is on its way to the field again; nearly one-half of this time is consumed in changing the horses from the wagon to the rope, backing out the wagon, putting in the team and getting a drink and the forks. The quickest time we ever made, after the horses were hooked on to the rope, was three minutes and thirty-six seconds.

The principal advantages of the sling over the hay-fork are these: first, it is far easier to handle; second, no power is expended in tearing the load apart; third, it puts the load in the mow and not on the barn floor; fourth, it unloads sheaves as well as loose material: fifth, it sheds no grain and takes the load off of the rack clean.

The loss over the hay-fork is the time it takes to spread the ropes when loading, which amounts to about two minutes per load. The track and all fixtures, including the large rope, are furnished and put up by the manufacturer for a specified amount. I have no interest in this matter, but to benefit the farmer, and I believe that in ordinarily intelligent hands the hay-sling is superior to the hay-fork.

The Poultry Yard.

RAISING GEESE.

There are three points of profit in raising geese—feathers, flesh and eggs. When properly managed the feathers form the most profitable branch of this industry.

To be successful here some experience is necessary. To secure the greatest profit from the feathers the goose must not be allowed to sit; she can then be picked four times a year, yielding something over a pound of feathers and about a quarter of a pound of down—only what is called the "top" down should be picked and even this should be left on at the last picking, about the first of November. To prepare the feathers for market, they should be pulled well apart and put into bags or, better yet, into nets and hung up to the ceiling to dry. If they are not well dried, worms are liable to form in the quills. The worm eats the feathers, and, of course, spoils them for use. To be in the best condition they should dry from three to four weeks; but by making the room quite warm the feathers can be prepared for market in a few days. Live feathers, that is, those plucked from the live goose, sell for from seventy-five cents to a dollar a pound, the down bringing about twice this amount. A goose that hatches out and rears a clutch cannot be picked more than twice a year, so that it is well to let only a few do the hatching, and have them alternate each year at this, if it can be done, as it is injurious to most incubating fowls not to be allowed to hatch out one brood a year.

The flesh of the goose when properly fattened, is highly relished by city customers. In preparing the birds for market it is well to keep in view the holidays observed by different nationalities. There is the universal Christmas

when nearly every one loves goose. On Thanksgiving Day the American frequently develops a decided liking for this bird. On Easter Sunday certain classes of Christians are devoted to the goose, and at the Jewish holidays in the Fall the Hebrews consider this an indispensable dish.

The goose is more fond of eating than of liberty, and can be easily penned up and fattened. To do this, put six or eight together in a dark pen and give them all the food they will eat. Corn and barley thrown into water form an excellent food for fattening them. Two weeks should be sufficient time to render them fat enough, if they are in fair condition when put in the pen. A goose well fattened should weigh from 15 to 20 pounds and sell for from a dollar to a dollar and a half.

There is some difference in the breeds of geese so far as laying qualities are concerned, though most of them can be induced to lay two clutches of 12 to 15 eggs each, provided the eggs are taken away from them as fast as laid. Goslings are very hardy, and unless caught by water vermin, are pretty well able to take care of themselves. Turtles are very fond of them, however, and they should therefore be kept out of deep water until half-grown. They are large enough for the table at six or eight months of age. The eggs are worth five and six cents each, but there is little demand for them in the general market.

The chief objections to raising geese are, first, that they are immoderate foragers and respect no man's property. They are usually a source of constant annoyance to neighbors, and where truck gardeners live, there is no peace with them. With the sides of the bill they can cut grass as close as a lawn-mower and their droppings are said to be poisonous to all vegetation. If allowed to mix with other poultry, they are almost certain to pollute the water that the other fowls drink until it is death to them. The man who raises geese should devote himself to this branch of industry and have no other feathered animals about him. It is said geese cannot be fattened if kept within reach of salt water though they multiply rapidly under such circumstances. Without the aid of a large body of water or running stream, it is doubtful if geese can be raised at profit, as they are large eaters and, not producing eggs for market, there is too much idle time in their lives. L. S. H.

Excellent Poultry Account.

WHETHER upon the broad acres of the farmer, upon the lawn of the suburban resident, or the restricted limits of the village lot, around the homes of the industrious poor or the mansions of the rich, there is nothing that will afford as much real pleasure to its owner as a flock of pure-bred fowls. Their beautiful plumage, distinct markings, and even size at once win the admiration of the visitor, and to the fortunate owner they are a source of untold delight, and in many cases they will amply repay for both the time and money expended in providing suitable accommodations for their comfort and a proper supply of nutritious food. Yet, comparatively speaking, around very few of our rural homes are such fowls to been seen. Generally a mixed or mongrel race is found, and in most cases very little attention is given to this part of domestic economy.

During a series of years great care has been taken by me to keep an accurate debit and credit account with a given number of fowls, the result of which from year to year has been given to the RURAL readers, solely for the practical information contained therein, and with the wish to benefit others, and particularly that class who have regarded their fowls as among the most troublesome and unprofitable of all their live stock. For five consecutive years these poultry accounts have been published in the RURAL and very widely copied by the press.

JAN. 1, 1880. IN ACCOUNT WITH 215 FOWLS.	DR.
To 215 fowls, at 60 cents each	$129 00
82 bushels of corn, at 60 cents	49 20
2 tons of cracked corn, at $22	44 00
2½ tons wheat middlings, at $23.50	52 88
220 pounds rough tallow, at 5 cents	11 00
100 pounds scraps	3 50
12 gallons kerosene oil, at 10 cents	1 20
10 pounds sulphur, at 7 cents	70
Red pepper	2 21
Total cost	$293 69
DEC. 31, 1880	CR.
By 1,054 10-12 doz. eggs	$208 48
73 fowls sold	53 20
317 roosters and culls	100 28
97 Plymouth Rocks (selected)	117 10
201 stock on hand, at 60 cents	120 60
136 bushels roost droppings, at 25 cents	34 00
Total proceeds	$633 66
Deduct cost	293 69
Profit	$339 97

Orange Co., N. Y. W. C. HART.

Young Ducks Feeding.

I am much obliged to Mr. L. S. Hardin for his answer to my question about raising ducks. The reason I asked the question was that I could not see how, with what we Yankees call a pot—which means an iron kettle eight to twelve inches deep—the young ducks could fish out the corn or any other feed in the bottom of it, with a board fitted on the top of the water with just room enough for them to put their heads into the latter; but when he says in his answer that he takes any old tin or iron pan, then, I suppose he means what we Yankees call a baking tin or a dripping-pan to bake meats or bread in, that would be an inch or two in depth, instead of the cast-iron pot, as mentioned. The difficulty arose from my not understanding the terms used by Mr. Hardin, and that is the difficulty generally, I think; writers use terms not well understood by readers, causing criticism or misunderstanding thereby. J. TALCOTT.

Various.

Dogs and Sheep.

In the RURAL of January 15, in J. S. Woodward's article, "Shall we Breed Sheep or Dogs?" the following appears: "The dog fund is so grossly deficient that there are now more claims," etc. I desire to call his attention to the law as we have it in Somerset county, N. J., and I think the same law works throughout the State:

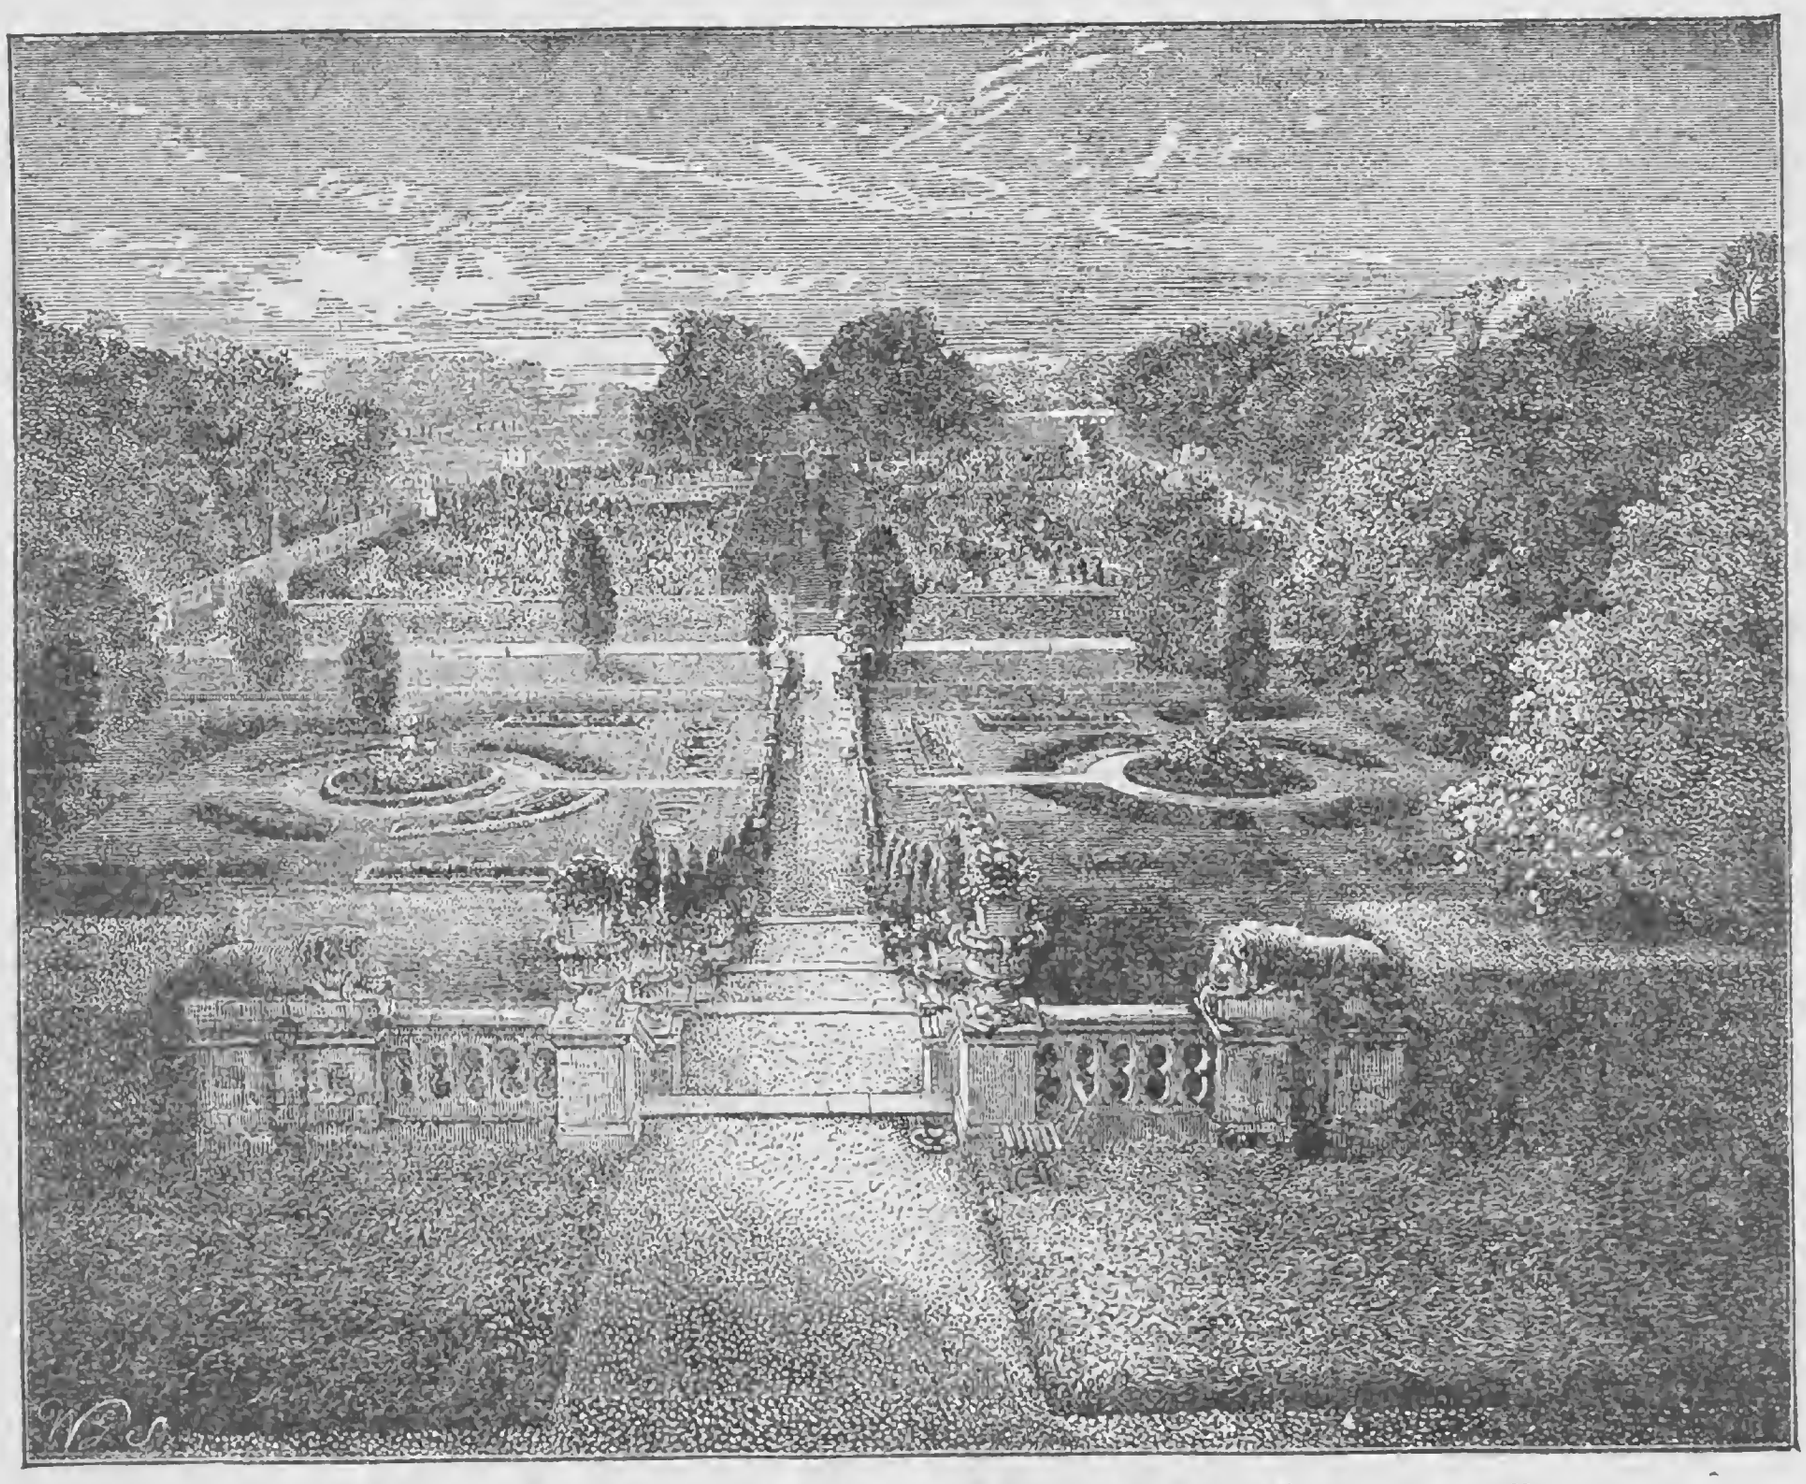
All dogs in the several townships are taken up by an assessor and a tax per capita levied according to the amount of damage done to sheep, hogs or poultry, and collected like all other taxes. So that if the assessor faithfully discharges his duty, no dog escapes its proportion of damage tax; and thus each sheep raiser is remunerated for actual loss. Of course the scare cannot be estimated in money value, although the appraisers usually take in all details of damage.

SPIKELET OF ORCHARD GRASS.
See page 156.

The dog tax in Franklin Township, due last December, was $3 50 per capita; in Hillsboro Township, 80 cents per capita, and the prospect is that in Bridgewater Township this year judging from the number of sheep already killed, the dog tax will be at least $3 per capita. You will see how this law *ought* to work. "PUM."

A Geometrical Garden Scene.

The scene represented in the acompanying engraving, Fig. 157, we give more for its beauty than for its utility, either for our farmers or suburban residents. Our hot summer suns are not favorable to this sort of carpet gardening or the evergreen turf so necessary to set off the colors of the masses of flowers and bright foliage. Besides the pleasure derivable even from pictured beauty, however, many of our readers can doubtless get some good suggestions from the view as to the arrangement of their flower beds and the groupings of the shrubs and trees around their homesteads.



THE GEOMETRICAL STYLE OF GARDENING.—RE-ENGRAVED FROM THE LONDON GARDENERS' CHRONICLE.—FIG. 157

A PROLIFIC COW.—Mr. Frank Shedd, Shedd's Station, Oregon, referring to a cow mentioned in the RURAL of January 15, that had six calves in less than two years, tells us of an Oregon cow that is "some pumpkins" in calf getting. She lives in the above neighborhood, is only five years old and has already had six calves, having, on the last occasion, had triplets which are all alive and doing well.

COAL FOR HOGS.—A correspondent from Centralia, Kansas, says that he has never found his hogs doing so well as they have during the past Winter, and he attributes their thrift especially to the refuse coal he has been feeding to them at the rate of about five bushels a week to twenty hogs, the coal costing only five cents a bushel at the pit.

POLLED CATTLE.—Men are learning the arts of peace—that is, to live without war. The logic of the World's progress must deprive our domestic animals of their war-like implements. Horns are often ten per cent. of the animal's cost, and no benefit. In the cost of shipping, they are twenty per cent. D. S. M.

OUR ANIMAL CUTS.—Colonel Curtis says: "I like your pictures of animals because they are natural whereas almost all others are fixed up or made from the trade cuts, which are not natural."

SMALL FRUITS IN NORTH CAROLINA.—The article under this caption in the Small Fruit Special Number, was written by Mr. Henry Smith of Henderson, Granville Co., N. C., not Buncombe Co.

Pomological.

PECK'S PLEASANT APPLE.

THIS is a first-class fruit in all respects. Mr Downing thinks it originated in Rhode Island, where, and in Northern Connecticut, it has been for a long time cultivated. It resembles the Yellow Newtown Pippin, with more tender flesh, while it is hardly inferior in flavor.

The tree is a moderate, upright, spreading grower, bearing regularly and well and the fruit commands a high price in the market. The apples upon the lower branches of old trees are flat, while those on the upper branches are nearly conical. The fruit is above medium in size, roundish, a little ribbed and slightly flattened, with an indistinct furrow on one side. The skin is smooth, and, when first gathered, green, with some dark red, but when ripe a beautiful clear yellow, with bright blush on the sunny side and near the stalk, marked with scattered gray dots. The stalk is peculiarly fleshy and flattened, short and sunk in a wide rather wavy cavity. Calyx woolly, sunk in a narrow, abruptly and pretty deeply sunk basin. Flesh yellowish, fine-grained, juicy, crisp and tender, with a delicious, high aromatic sprightly subacid flavor. Its season is from November to March and its quality ranks from very good to best. Mr. Downing concludes in a note to us in answer to our inquiry: "It is a very good Winter apple either for home use or market, and should have a place in every good collection. Mr. E. Williams says "I esteem it as one of our *very best* Winter apples, occupying the position among them that the Fall Pippin does among Fall varieties. The more it becomes known, the better it will be appreciated." According to our best information, Peck's Pleasant succeeds best in the following States: Vermont, Rhode Island, New York, Michigan, Ohio and Indiana.

THE CLARKE APPLE.—In an article on this apple in the RURAL of December 11 last, Mr. Samuel Stevenson stated that it originated about 100 years ago; while Mr. I. F. Tillinghast thought it was not over 25 years old. That it originated at Clark's Green is a well known fact hereabouts; but it could not have done so 100 years ago inasmuch as the History of the Lackawanna Valley shows that the

place where it originated was not settled until 1794. Neither could its origin have been as late as 25 years ago, for the apple has been on the farm where this is written for upwards of 40 years. It is an excellent apple and worthy of commendation. G. H. C.

Dalton, Pa.

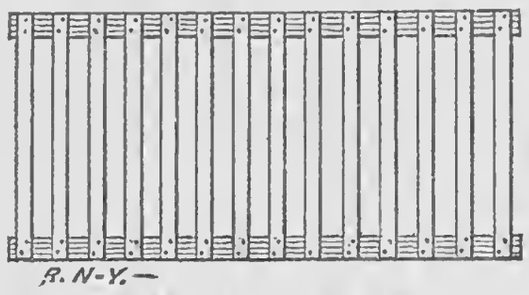
PEAR BLIGHT.—D. B. Wier's theory of pear blight does not accord with facts. The thriftiest and best trees I had, standing in grass and cultivated, were blighted and killed to the ground while loaded with fruit, whereas the ones which I considered worthless, on account of having been winter-killed two years ago, were free from blight, and bore perfect specimens of fruit. G. W.

Horticultural.

CELERY GROWING.

ONE of the most profitable garden crops that I raise is celery. I raised the past season about 5,000 heads of which I lost about 1,000 owing to the Winter setting in so unexpectedly. The 4,000 heads saved will bring, when all sold, about $125. This was all raised as a second crop following peas, and it did not occupy more than one-fourth of an acre. I also sold about $25 worth of celery plants. I raise very nice plants in the following way:

I sow the seed in a cold-frame about the



CELERY FRAME.—FIG. 158.

middle of April, and when about an inch and a half high I transplant to beds four feet wide by sixteen in length, setting the plants two inches apart each way. As soon as the bed is finished I have frames made of narrow strips of board and lath, the lath being their width apart. These I place over the bed about eight inches from the plants on the top of the stakes, three of which are driven on each side of the bed. By the use of these frames the plants enjoy a free circulation of air and are just half the time in the shade (while the sun shines) and will not wilt or need watering except at the time of setting out. The frames may be left on until the plants become well rooted. Plants treated in this way become very fine and stocky in from four to six weeks and may then be taken up with a ball of earth as large as a man's fist adhering to each plant.

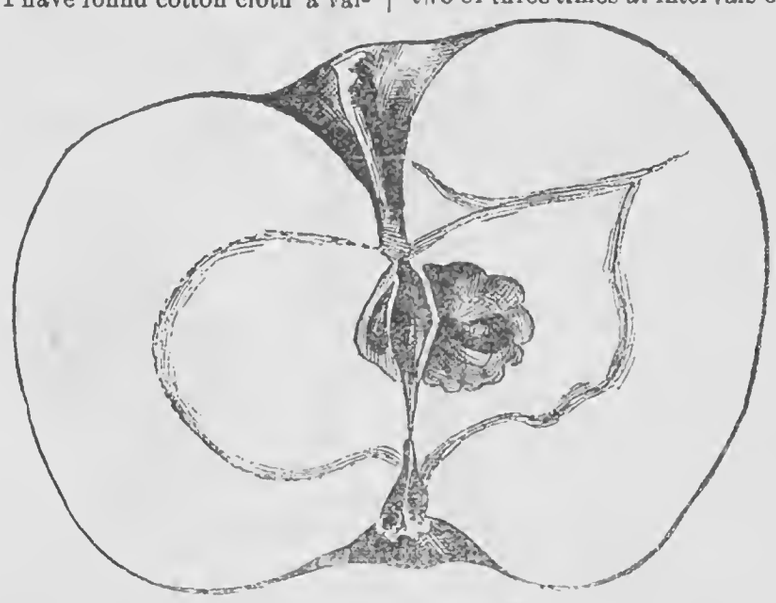
I transplant to the trenches from the 1st of July to the 1st of August. The trenches I make very shallow, about four inches below the surface after the plants are set out, some kind of fertilizer being below the plants. I have seen the best results from well rotted stable manure. I commence to earth up as soon as the plants begin to spread so as to keep them growing in an upright position, taking care not to choke them with too much earth at one time. I raise the dwarf varieties and have found the London Red the best for late keeping also the best flavored according to my judgment. I have the trenches four feet apart and the plants six inches apart in the trench. This, I think, is as near as is convenient for earthing up.

Before I commence to earth up I loosen the earth on each side of the trench with a hoe. I then get down on my hands and knees astraddle of the row, and, while holding the stalks of a plant together with one hand, I draw the earth up with the other, pressing it down firmly around the plant. The best time to do this is when the ground is a little moist but not wet. This process is called "handling," and by many it is called hard, disagreeable work; but there is no work in the garden that gives me more genuine satisfaction. This first handling brings the plants up nearly level with the surface, and before the second earthing up I run a cultivator up between the rows. I commence to harvest the celery for Winter about the 1st of November. My way of storing it is to make large beds of it on the cellar bottom, setting the celery upright and not too close together, and using earth enough to cover the roots well. If the cellar is dry, the beds may be watered occasionally, but in a damp cellar it would not be necessary and would be apt to induce rot. ADELBERT WAKEFIELD.

Oneida Co., N. Y.

Cotton Cloth for Hot-beds.

The RURAL was undoubtedly correct when it said lately in the "Queries" that "no substitute for glass for a hot-bed has yet been discovered," but I have found cotton cloth a valuable protection for hot-beds and cold-frames in the late Spring, when more space is required, as the tomatoes, peppers, etc., are transplanted from time to time as their growth necessitates. I made my frames four by eight feet, the ends being built up in the form of a gable roof with a ridge-pole, to which was tacked the cloth. This was made double at the center, for greater strength, and wide enough to hang over the sides of the frame. It was secured by loops at the edge over wooden pins in the side of the frame. A dressing of linseed oil will render it more durable and nearly water-proof. The advantages it possesses over glass, besides its greater cheapness, are, that with it there is no danger from excessive heat, either bottom or sun; that it requires but little attention, while on windy days the windward side may be closed and the other open to air and sun. Of course, glass must be used for the seed-bed, except very late in the season; but for the last bed before going into the open ground cloth (common sheeting) is much preferable. M. B. PRINCE.



PECK'S PLEASANT APPLE.—FIG. 159.

How to Raise Radishes.

One of the compensations for the white hairs in our beards that frighten and warn us, is that we know more than we did. It may be that all readers of the RURAL know how to raise radishes. It is an acquirement that has come to me within a few years, and it may be an item of value to some, especially if they are as fond of nice, crisp radishes with their bread and butter as I am.

To grow them, select a light, rich soil—a deep, moist one is the best, if you can get it—spade it deeply without manure and immediately thereafter, while the soil is moist and fresh, sow the seed thickly broadcast; rake it in and leave it alone. Radishes like a moist season to do their best, and if you can conveniently give them frequent and abundant waterings after the seed is up, you will be well repaid. For succession, seed should be sown two or three times at intervals of two or three weeks. A very important consideration in all seed sowing is to sow when the soil is freshly turned.

Rochester, N. Y. G. S. W.

WACHUSETT THORNLESS BLACKBERRY.

LAST Summer Mr. J. T. Lovett brought to this office a branch of the above blackberry of which our engraving below is a portrait. The berry is of excellent quality; the canes are hardy, healthy and strong. It is not, however, we believe, very productive. Its quality and its being nearly free of thorns are the chief points of merit.

WACHUSETT THORNLESS BLACKBERRY.—It is certainly an object worthy of any man's ambition to breed off the terrible thorns that make the blackberry an object of dread even to the man of horny palms. There can be no doubt that a class of *first-rate* blackberries without thorns would have the effect of very greatly extending the cultivation of this fine and healthy fruit. The blackberry could be robbed of its terrors without the loss of any of its goodness, and somebody will yet be found to do it. I can only speak of the fruit of the Wachusett. The berry is somewhat oblong, of medium size, sweet, and of good quality. It is an improvement on Newman's Thornless. Of the growth and habit of the plant I know nothing. PETER B. MEAD.

WACHUSETT THORNLESS BLACKBERRY.—FIG. 160.

WE see that Alfred Bridgeman offers seeds of the beautiful grass Eulalia Japonica Z-brina. The *plants* but three years ago sold for five dollars each, and even now bring one dollar each. We should like to know what proportion of seedlings show the transverse variegation.

Miscellaneous.

RURAL BRIEFLETS.

RESPECTING the "Golden Grain" Wheat we have just received the following note from a correspondent in Pennsylvania:—"I this day send you by mail a sample of the Golden Grain or Palestine Mammoth Wheat, which I think will excel anything you have in New York State. If you have anything better, I should be pleased to see a sample."

"P. S.—The Golden Grain or Palestine Mammoth Wheat was brought from Palestine four years ago. It is a very hardy and most productive variety, with long, stiff straw. It stands well and stools heavily, growing from 25 to 70 stalks from a single grain. The ears are of good length, closely filled with full, plump grains, with but little chaff, having yielded last year 32 bushels on one-half acre of land. The greatest curiosity about this wheat is that when it first shoots into heads it is a bearded wheat, but when it is ripe it is a smooth wheat." . . . . . .

WE have received from Mr. Charles A. Green the first copy of his "Fruit Grower." It consists of eight pages, 14 inches by 10½ in size. This it is proposed to issue quarterly at the price of 25 cents per year. We have this to say about the venture: Mr. Green is a forcible, trustworthy writer, and it may be expected, therefore, that his experience in fruit growing will be presented, as it is in the present number, in a very acceptable manner. It may be presumed that a rural journal, whether devoted to agriculture or to horticulture in any of its branches, should be edited by those who, from *experience*, know whereof they write. Such, however, is not always the case. We know of editors of agricultural papers who do not see a farm or garden, except by accident, from one year to another. And yet they set themselves up as teachers. The trouble is that they are just as likely to teach wrong as to teach right. They cannot, in re-writing or even in copying what others say, separate the wheat from the chaff. It is this kind of rural journalism that, among many well-disposed farmers, has brought "farm papers" into disrepute. We are glad to see Mr. Green's paper, because from his writings (we have no personal acquaintance with him) he may be judged as one who, while his experience enables him to judge wisely, loves pomology too well to praise or condemn unjustly. Mr. Green's address is Clifton, Monroe Co., N. Y. We heartily wish him success, and we hope our readers will examine his paper, specimens of which will no doubt be sent to those who apply. . . . . .

IN looking over the new Spring catalogues we are rather impressed with the engraving of, and remarks respecting, the new Russian White Oats in the catalogue of D. M. Ferry & Co., of Detroit, Mich. The panicle presented, if drawn from nature, is simply immense, while the tests which have been made in various parts of the country, in a small way, seem to give promise that the variety is wonderfully prolific while it has not as yet been attacked by rust. We have ordered a trial quantity of these oats and shall thus be enabled to inform our readers of their value and productiveness in due time. . . . . .

IN several catalogues — among them those of James J. H. Gregory, D. M. Ferry & Co., Alfred Bridgeman and Peter Henderson — we see the "Mammoth Pearl" Potato offered and highly praised for its quality, beauty and prodnctiveness. It is hard to keep the run of new potatoes, so numerous have they become; but in the long lists there are no doubt many that will take the place of the older kinds, whose names, one by one, are being forgotten. . . .

MR. JAMES VICK also offers the Russian White Oats. Reports, which he prints, say that the panicles are in some cases from 18 to 23 inches long, and the straws strong and bright. We should like to have our friends try the Russian White beside the Washington and report the result to the RURAL NEW-YORKER. . . . . .

JAMES M. THORBURN & Co. offer a new squash called "Perfect Gem." It was shown to us last Fall on the vines, and we had never before seen so many squashes growing so closely together. We attempted to procure seeds for our distribution, but they could not be supplied in large enough quantity. The "Perfect Gem" is not over six inches in diameter, of an oblate-round shape, and the quality is certainly of the highest excellence—being sweet, delicate, dry and tender. It seems that in a cool, dry room this squash will keep until Spring. . . .

WE have more inquiries as to Chester Co. Mammoth Corn than of any other field crop to which we have ever alluded. The questions generally are not, however, "Where can I get Chester Mammoth seed?" but "Where can I get the seed raised at the Rural Farm?" We cannot reply to this question, since there is but one establishment to which we have sold

the seed, and the quantity sold would not be sufficient to meet the demand were we to publish the name of the firm. . . . . .

HIRAM SIBLEY & Co. make a specialty of verbenas, a colored plate of which in their catalogue shows a half-dozen of the most brilliant colors. Verbenas, if sown in the open ground as soon as it can be worked, will bloom in late Summer; but it is better to start them now in pots or frames, in which case seedlings will bloom as early as potted plants set out in late May. For budding plants and for bouquets few flowers are more satisfactory than the verbena. . . . . .

PETER HENDERSON'S catalogue gives prominence, among farm seeds, to the favorite White Russian Spring Wheat, to which the RURAL NEW-YORKER gave prominence years ago in the report of a comparative test of many different kinds of Spring wheat. Among flowers the new single dahlia "Jaurezii" is spoken of as bearing blossoms of a rich crimson, resembling in shape those of some of the cactus tribe. . . . . .

AN old and very interesting plant is Bryophyllum calycinum. When a plant is interesting for oddity mainly, its popularity is usually confined to brief periods long separated. This Bryophillum has been much written of at times during centuries, for aught we know, always exciting a lively interest for a time and then, as it were, ceasing to exist. If a leaf of this plant be suspended by a string, or placed on a mantel, or left upon the earth of a flower-pot, in about ten days, as we remember, little plants with leaves and roots appear in the axils of the scallops or edges (crenatures) of the leaf so placed. These may be cut out and planted in thumb-pots and they will grow the same as other tiny plants so treated. When young, the Bryophyllum is beautiful and well supplied with its fleshy, smooth leaves; but in two or three years, as it nears the blooming period, it loses its foliage and the spreading panicles of hundreds of queer-looking flowers, resembling fuchsias somewhat, are all that is left besides the tall, leafless stalk. Seeing this plant offered in the catalogue of Storrs, Harrison & Co. suggests the above remarks, which, though old to our old readers, may be new to our new friends. . . .

IN reply to our recent editorial commenting upon some rather unkind insinuations in connection with this journal and Commissioner LeDuc, published in our respected contemporary, the Prairie Farmer, the latter says:—"Let the RURAL NEW-YORKER be undeceived. The Prairie Farmer disclaims the remotest wish or purpose to injure that journal or its editor." . . . . . .

MR. WILLIAM ROBINSON, the editor of the London Garden, who has proven himself an excellent friend of American horticulture, tells the RURAL NEW-YORKER:—"Kindly warn your American apple growers that the Canadians will beat them if they don't mind, giving as they (the Canadians) do, fruit well and regularly packed throughout, not merely topped off with good ones at each end." Our readers may remember that we have already twice or thrice called attention to this subject. . . . . .

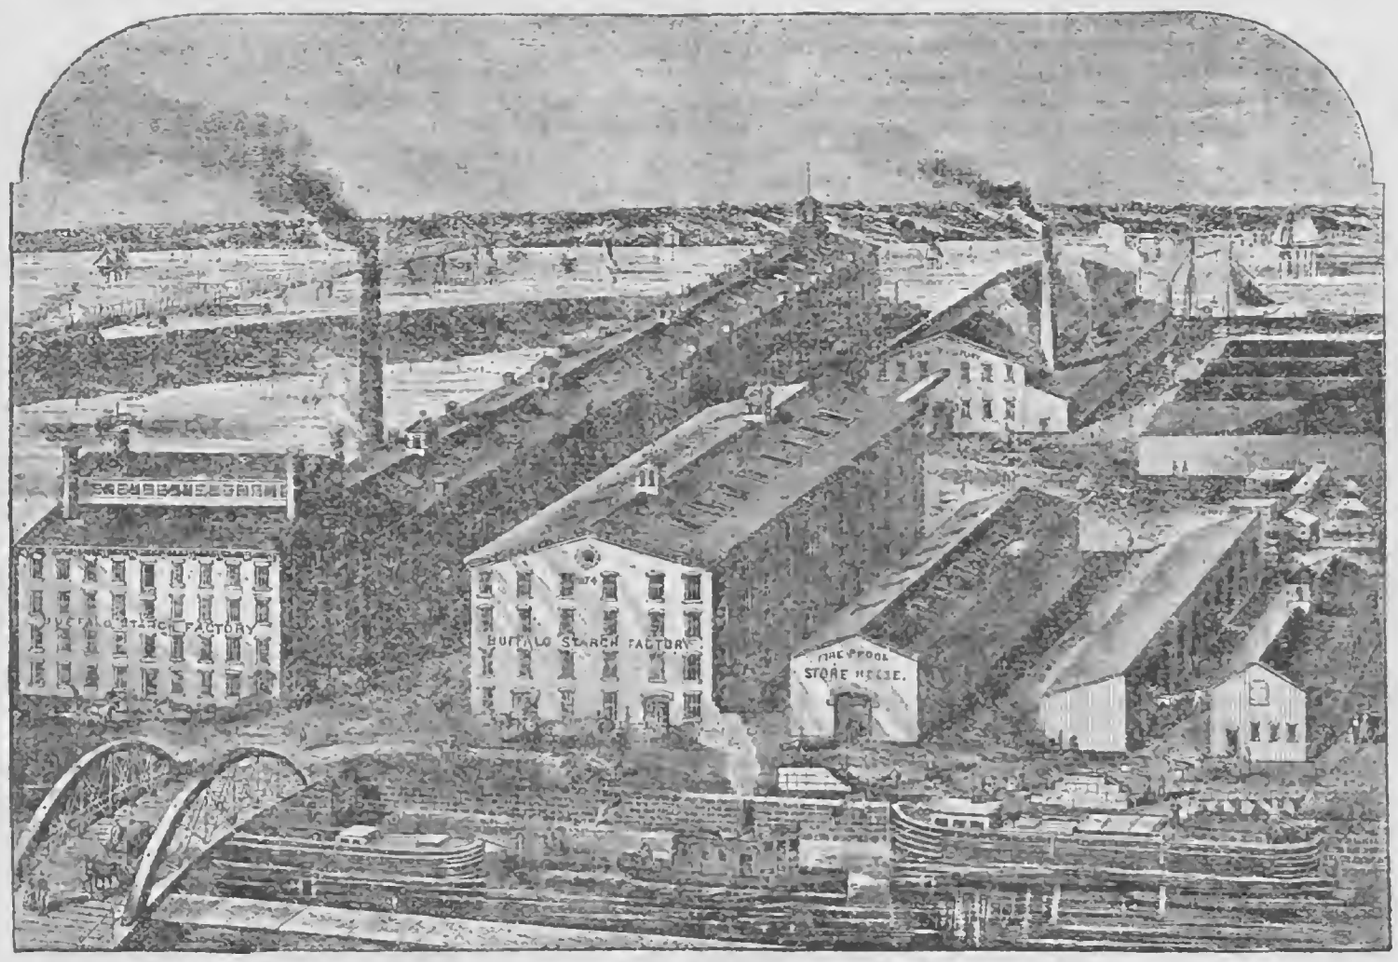
STARCH AND ITS MANUFACTURE.

EVERY one is supposed to have a general idea of the nature of this useful article, and of some of the sources whence it is obtained; but comparatively few are acquainted with many of its highly important qualities. Starch is very widely diffused throughout the vegetable kingdom, and is an organized substance belonging to the carbo-hydrates. It occurs in roundish grains in the cellular tissues of the seeds of cereals and in peas, beans, potatoes, etc. The grains in the same kind of plant are quite uniform in size and shape, but they vary slightly in different species of plants. Some of the larger grains exhibit a series of concentric rings, and in some may be seen, with a very strong light, a well marked black cross, as in potato starch. Commercial starch is heavier than water, and dissolves in nitric acid, but not in cold water, alcohol or ether.

Starch is most commonly obtained by separating it from other ingredients with which it is associated, the mode of separation varying much according to the source from which it is obtained. In extracting it from potatoes, they are first thoroughly washed and then rasped by machinery. The pulp thus obtained is placed upon a sieve and gently washed by a stream of water until the washings have no longer a milky appearance. The milky liquid is received into vats, the starchy matter is allowed to subside, and the water is drawn off. The starch is then suspended in water, run through a sieve to force from it any particles of sand, and, after settling again, it is transferred to baskets lined with ticking, where it is drained, after which the mass is placed upon a porous floor of half-baked tiles, and allowed to dry. In obtaining it from wheat or rice a more complicated process is required.

The demand for starch is very great, and many of the uses to which it is applied require that great care should be exercised to produce it in its purity. Pure water is an indispensable requisite in this connection, and on the location of the factory largely depends the success of starch manufacturing.

The Buffalo Starch Factory (an engraving of which we are enabled to give our readers, herewith), is situated on the banks of the Niagara River, about a mile from Lake Erie, and the wisdom of choosing such a location has been abundantly demonstrated. Although it has been in operation but 13 years, it is said to rank third in the world in the amount of its production. Something of the capacity of this establishment will be readily inferred from the representation here given.



GENERAL VIEW OF C. GILBERT'S STARCH WORKS, BUFFALO, NEW YORK, U. S. A.

FIG. 161.

LATE EXTRACTS FROM CORRESPONDENTS' LETTERS.

Kindly Words for the Rural New-Yorker.

"I AM glad to see that you are making the RURAL *by far* the best horticultural publication in this country. Your engravings and notices of new fruits and plants are always looked for with great interest."

So. Glastonbury, Conn. J. H. HALE.

"I like the RURAL; I think it is the best farmers' paper published. The articles on stock are interesting and instructive. I like the independent way in which it speaks on fruit, condemning all it thinks worthless, and praising only such as it thinks improvements on old sorts." E. N. G.

Newburgh, N. Y.

"I have just received the RURAL Shrub and Tree Special, and a most beautiful and useful number it is, and well calculated to elevate and improve the taste of all its readers, and help them to adorn their homes and the country also around them." A. B. ALLEN.

Queens Co., N. Y.

"The 'Corn Number' was most excellent. I take pleasure in comparing our old RURAL with other farm papers. All the others seem weakly productions." REV. R. H. CRANE.

Orleans Co., Neb.

"The RURAL is the best paper I get hold of. The Corn Number is worth the year's subscription." JAMES FENTON.

Middlesex Co., Mass.

"I could not think of stopping the RURAL, packed as it has been with valuable articles for the past year. It has been worth to me many times its cost." J. HUNTER.

Adair Co., Iowa.

"The RURAL for January 22, is a superb number, and so also was your Corn Number. The RURAL NEW-YORKER is a strong, honest, practical journal, and I like to read it." CHARLES SHINN.

Previously Editor of the California Horticulturist, and now of the Evening Bulletin.

"I have received a great number of sample copies of agricultural papers within a few weeks, but for reliable information upon agriculture and horticulture, and for interesting reading matter, the RURAL NEW YORKER is of more real value than all of them taken together." G. W.

Rock Falls, Ill.

"We believe there is no better agricultural paper published in the world than the RURAL NEW-YORKER. This is high praise, we know, but in our opinion it is deserved. Added to this, it is an excellent home journal, and every week's issue contains valuable reading for each member of the family."—J. A. Woodward in the Centre Democrat, Pa.

"I am so well pleased with the Beauty of Hebron and Golden Ovoid Mangel that I am anxious to try the forthcoming potato, and to say I think your endeavors to disseminate the best of seeds, potatoes and berries is deserving of much praise and gratitude from one and all. Orleans Co., N. Y. A. STERLING.

"My subscription to the RURAL is almost out, and I feel, though I am hard-pressed and a poor man, that I cannot do without it, so I send you my subscription for another year." WM. HARBERT.

Harrison Co., W. Va.

"It's a glorious old paper; long may it wave! I have subscribed for it for the past 18 years. Davidson Co., Tenn. W. H. H. TRUITT.

"It is the first time I have seen the RURAL since I have been in the mountains, although my parents, at the old home in Michigan, have taken it ever since I was a small boy. It is the best paper of its kind I ever saw, and brings back to my mind recollections of happy times when I was a boy, and before I left the old and much-loved home in the States—over 10 years ago. T. D. ELDRED.

Madison Co., Montana T.

"I have taken the RURAL for 29 years without a break—since 1852. I think the paper this year is better than it ever was before, and that it is the best agricultural paper in the world." JOHN BRADLEY.

Wayne Co., N. Y.

"I tell everybody that the RURAL is the best paper published, F. D CURTIS.

Kirby Homestead, Saratoga, N. Y.

"I am much pleased with the RURAL, and wish it a continuance of prosperity based upon its great merits." JNO. W. PRESCOTT.

Rapides Parish, La.

"I like your paper very much, and I can truly say that it has been worth many times its cost to me, and I wish it might find a place by every fireside." D B. RANDALL.

Franklin Co., Kan.

"Your special Shrub and Tree Number was very timely and valuable to me, and I hope to others. To me it is richly worth a year's subscription for the RURAL." Oneida Co., N. Y. LORENZO ROUSE.

"The RURAL is the best paper I have seen of its class for suburban residents who take a pride in their home and its surroundings. The issue of Feb. 12th is worth the whole subscription price to me, containing, as it does, the very information I was looking for—how to artistically plant my lawn and grounds." Chicago, Ill. WM. P. G.

"I will not be without the RURAL as long as I can raise the amount of subscription; for the information contained in its columns is worth ten times the price of the paper." A. L. L.

Arredonda, Fla.

"The Illustrations and make-up of the last RURAL Special were very happy. I could not help being reminded of that grand old teacher A. J. Downing. I am glad I am not the editor of a weekly paper—I should become crazed, I am sure." C. A. GREEN,

Clifton, N. Y. Editor of the Fruit Grower.

"We think the RURAL a necessity which we can't do without. As it grows better and better we become more and more attached to it. We thank you very much for the seeds you sent us." R. G. PAISLEY.

Bond Co., Ill.

"I am happy to see that the RURAL NEW-YORKER is a grand success." E. W. STEWART.

Erie Co., N. Y.

"We have taken your paper for several years and think it the best agricultural paper in the United States. I have tried most of them; but we cannot do without the RURAL."

Marion Co., Oregon. HENRY CARTER.

"The present is my 25th year's subscription to the good old RURAL; I don't know that I can say more in praise of it. I expect to take it as long as I live, if I can pay for it.

Delaware Co., N. Y. JOHN A. MORSE.

"I would not take three times the amount of the subscription to your paper for the seed I have now on hand." A. J. UTTERCACH.

Montgomery Co., Ind.

BOOKS, CATALOGUES, ETC.

BARN PLANS AND OUTBUILDINGS, with 257 illustrations. This is an excellent cloth-bound volume of 235 pages, 12 mo., published by the Orange Judd Company, 245 Broadway, N. Y. City. It contains a large number of elevations and plans of barns of all sorts suitable for every purpose and situation as well as many plans of cattle sheds, sheep shelters, pig-pens, poultry-houses, dairy-houses, milk-rooms, grain bins, corn cribs, granaries, smoke houses, dog kennels, and bird-houses—in fact, all sorts of farm outbuildings together with ample printed explanations. At the end a couple of chapters are also devoted to representations and descriptions of various forms of silos for preserving fodder, as well as of root cellars.

AMERICAN SANITARY ENGINEERING, by Edward S. Philbrick, C. E. This volume of 129 pages, octavo, treats of the ventilation of buildings; drainage of towns; details of sewage; ventilation of sewers; ventilation and cleaning of sewers; house drainage; apparatus used for house drainage, and public sewers and privies. Its author has had great experience in constructing sanitary works in different climates, and his suggestions, therefore, are valuable to those who live in localities where extremes of temperature prevail.

PRACTICAL ARTIFICIAL INCUBATION. By Edward Brown, F. L. S. Cassell, Petter, Galpin & Co., New York. This pamphlet of some 60 pages is the second edition of a work which has a considerable sale in the United Kingdom. It gives an illustrated account of the various incubators and artificial mothers that have been offered to the public in Great Britain, together with a good deal of other practical information on artificial incubation.

REPORT on the Culture of the Sugar Beet and the Manufacture of Sugar therefrom in France and the United States. This work of 294 pages was prepared by Dr. W. McMurtrie, under direction of Commissioner LeDuc, and is issued by the Agricultural Department.

REPORT and Proceedings of the Executive Committee of the International Dairy Fair held in this city in December, 1878, containing lists of exhibitors, awards of premiums, reports of committees, etc. T. Mortimer Seaver, Sec'y.

Also a similar work for the exhibition of 1879.

STUDIES OF THE FOOD OF BIRDS, insects and Fishes, made at the Illinois State Laboratory of Natural History at Normal, Ill. S. A. Forbes, Director.

REPORT of the Surveyor General and State Land Register of Nevada for 1879 and 1880.

PRELIMINARY REPORT of the Department of Agriculture for the year 1880.

FOURTH Annual Meeting of the New York State Dairymen's Association, with transactions and addresses for the year 1880. Copies of this work, which is full of useful information on Dairy topics, can be had from Josiah Shull, Ilion, N. Y.; price 25c.

CATALOGUE of the Edgwood Herd of Registered Jersey Cattle, owned by John L. Hopkins, Atlanta, Ga.

JOURNAL of the Proceedings of the Board of Supervisors of Chatauqua County, N. Y.—G. S. Josselyn, Supervisor of the town of Pomfret.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, MARCH 19, 1881.

This number of the Rural New-Yorker contains a four-page supplement.

In order to transact satisfactorily the constantly increasing business of the Rural New-Yorker, we have leased, for a term of four years, the entire front of our building facing Park Row, as well as that facing Beekman Street, hitherto occupied. The editorial rooms after May 1st, will be found on the right of the hall upon entering, the business department on the left.

If any farmer will consider the time and labor required to make the potato experiments detailed under Notes from the Rural Farm, he will see how inadequate ofttimes are the teachings of such experiments as compared with the cost of conducting them. "How far apart should we plant potatoes, cut to single eyes, in order to get the best yield?" The question is a simple one that it would seem ought to be answered by any careful set of tests. Such, however, is not the case, as anyone may discover who attempts to solve the problem.

A Poetical Cow.—A Cape of Good Hope paper thus describes the pet cow of a parsonage, for sale there. We think she must have been bred and reared under good instruction:—"She is a picture worth focusing by any photographer. Her coat is the sleekest; her temper the meekest; her form is the neatest; her udder the greatest; her eyes are the brightest; her milk is the whitest; her horns are the shortest; and if wanted more test to prove she is a beauty, a darling, a pet, just buy her, and you will have joy of your bargain."

Prof. S. W. Johnson corroborates, in his annual report (Conn. Ag. Ex. Station) the answers we have given to questions as to the value of salt as a fertilizer. He says "On some soils, salt (like gypsum on many soils) produces a good effect, not commonly by directly nourishing crops, for agricultural plants require no soda and very little chlorine, but by its solvent action whereby it disengages plant food from the minerals of the soil or in some indirect manner." The fertilizing value for any given crop or soil is only to be determined by actual trial. It must be borne in mind that salt is chloride of sodium.

Dr. Ravenel of South Carolina, as Professor Johnson states, finds that finely-ground Charleston phosphate rock is quite assimilable by vegetation, when applied in conjunction with vegetable matter, obtained by plowing under a large growth of the Southern cow-pea, or letting it decay on the surface of sandy or otherwise nearly worthless land. Professor Johnson remarks that the decaying vegetation would appear to dissolve the phosphate as effectually as, and more economically than, sulphuric acid. That is to say, a better economical result is obtained by applying a dollar's worth of finely ground phosphate rock with a decaying green crop, than by using the same worth of artificially dissolved phosphate.

The Mantes Fowl.—This is a new breed got up recently in France, and is now highly spoken of. It is something like the Houdan, possessing all the good qualities of the latter without its defects. It is brilliantly speckled in color, has only four toes to each foot, and no crest, but wears a well developed cravat. Now, if they will breed off this last useless excrescence, as they have the crest and the fifth toe, it will be quite an improvement. It is uncommonly precocious, fattens easily, and its flesh is of the finest quality. It is an excellent layer of large eggs, a fair setter and good nurse. We should think this fowl worthy of importation, and it might prove a good addition to the various sorts we already possess in the United States.

Longevity of Horses.—Mr. W. Douglas, late veterinary surgeon in the 10th Hussars, contends that if horses are well treated they may live five times as long as it takes them to attain maturity. Now, as they do not mature — except when greatly forced by high feed—till they are seven to eight years old, it follows that they ought to live 35 to 40 years. During this length of life they may be useful three-fourths of the time, which would be from 26 to 30 years. We will venture to say that American horses are so improperly treated that they do not endure more than half the above time, on the average, for good work. This reduces their usefulness of 26 to 30 years, to only 13 to 15 years. We know a horse that has been steadily worked on one of the city express wagons of New York almost daily for 16 years past, and he is still perfectly sound and as efficient as ever.

A CORRECTION—OAT GRASS.

On page 195 of our Supplement in answer to a query whether there is in this market a grass called Oat Grass; it is stated that "we do not find such a grass in seedsmen's catalogues, etc." This answer which was marked out on the page proof was left in by oversight. The "Tall Oat Grass" (botanically Arrhenatherum avenaceum or Avena elatior) is offered by all good seedsmen for about three dollars per bushel of about 12 pounds to the bushel. We are informed by Prof. Beal that this Oat Grass does well in some parts of Michigan. It is a perennial with stems about three feet high. Mr. Flint says that it is esteemed by those who know it for its early, rapid and late growth, making it well calculated for a late pasture grass.

Danthonia spicata is the "Wild Oat Grass" notable for the thick, wiry turf it makes upon dry sandy soils. This is also perennial with short, slender stems, and it blooms in early May. As a lawn grass for hot situations, we think this might prove valuable. There is a fine field for investigation among the grasses, and we propose to test, the coming season, several kinds which have always been deemed valuable but about which we seem to have little trustworthy information.

"BUTTERINE."

The malady afflicting Chicagoans, which goes under the name of "Winter cholera," and is referred to the eating of "butterine," into the composition of which lard enters, forms a striking proof of the power of habit among American eaters. Among the lower classes of people one article of food and one of drink seem to be regarded as the two great necessities of their existence—something in the way of grease to spread on their bread, and some hot, sweetened drink for their stomachs—and so great and uncontrollable is their passion for these two things that they will take up with the most miserable substitute for butter, in the one case, and gulp down a swill of burnt rye, sweetened with molasses, in the other. Of the deliciousness and wholesomeness of pure water as a drink they have no appreciation, and of the sweetness and toothsomeness of simple bread they have about as much. In regard to butter, there is nothing tolerable short of what is thoroughly good; anything less than that is an insult to the bread it is put upon. It is a much easier matter to do without butter than many people imagine, and if those who cannot afford to use a good article will do without any, as they dispense with other luxuries, their stomachs will be greatly the gainers thereby. Wholesome, plain bread and good water are excellent acquaintances for any man or woman to form, and such as will never cause regret or breed distressing results.

NOTICES TO SUBSCRIBERS.

If any of our readers have received the White Elephant Potato in a frozen or otherwise imperfect condition, they will please notify us by postal, giving their full addresses plainly written.

We shall begin the Seed Distribution this week and hurry it through with all practicable speed.

It is a satisfaction that we are enabled to send all of the varieties to our subscribers as originally announced. The packet of Rural Branching Sorghum is smaller than we had hoped to put up. But our South Carolina crop was virtually a failure.

It may again be necessary to state that, as we divide the postage with subscribers, we shall not send the seeds to those applicants who have not sent us their share of the postage (six cents). Those, however, who have subscribed for the Rural in combination with any of the journals with which we club, are not required to bear *any* of the expense—this having been added to the club price to simplify the matter.

We are very much in hopes that none of our readers (our old ones at least) will view our Plant and Seed Distributions in the light of *premiums*. The past is proof that we have sent out some of the most valuable plants in cultivation, and we think our Distributions should have ere now established for themselves the reputation they certainly deserve. The present collection has cost us more than any of its predecessors, and we cannot suppose it will prove less valuable. Those who for any reason cannot plant and cultivate them with due care, should present them to those who can.

OUR CATTLE PORTRAITS.

There seems to be a difference of opinion as to the accuracy—the merits, of our cattle portraits. Some praise them roundly. Some condemn them flatly. The accuracy of the photographs of which they are exceedingly correct reproductions is not questioned. But our artist, it seems, is expected to so "doctor" them that in lieu of a slight curve in the back; a reasonable proportion between the size of the feet and legs and the body, etc., they must be presented with backs of a dead level; feet and legs that are absurdly small; eyes that are of melting, ponderous mildness, and bodies of perfect symmetry.

But we beg to say that our object in presenting true portraits is to show our readers *what the animals are like!* It is not to invest the originals with ideal beauties that can never exist in fact. Such pictures are just as much exaggerated as those of strawberries, raspberries, grapes, etc., which are so often seen in our nurserymen's catalogues, and we do not see how any honest stockman can look upon such monstrosities without feeling that they convey falsehood just as effectively as if the characterizations were in so many written or spoken words.

In this connection let us call attention to our patent, adjustable cattle-portrait diagram on the last page. With slight alterations this may be made to give the desired outline and "points" alike for Jerseys, Herefords, etc., etc., just as the picture of Prince Imperial has gone the rounds as the portrait of several distinguished prize-takers.

With slight alterations and additions also, which will readily suggest themselves, the problem as to producing sex at will may be solved by our adjustable diagram, and a consideration of its merits is urged upon our illustrated stock journals.

UNDERSTANDING, THE FARMERS' NEED.

The great need of our farmers is understanding. We use this word as distinct from knowledge, intellect, education or wisdom, or, rather, as embracing them all and more. A liberal education—by which we mean a knowledge of the so-called higher branches, as mathematics, philosophy, astronomy and the classics—while it may render a farmer no less fitted for his business, is not really essential. The rudiments of an education, embracing reading, writing and arithmetic, well founded and *understood*, go a great way towards furnishing one with all that is absolutely necessary for a worker of the soil. The rest may come through the schools or through observation, logical and practical deductions, and experiments.

Knowledge is desirable, but of little use to him who knows not how to apply it. Intellect sets man above the brute, and the one man above his fellows; but the most intellectual man is not always, or often, the most successful in his undertakings. Education is not to be despised; but its possessor may not always know how best to use it, and the wise man may often learn from the ignorant one much that will be to his advantage in the lower walks of life.

We would say nothing tending to influence the agriculturist to neglect the acquisition of any or all forms of useful knowledge and culture, but we would endeavor to impress upon him the fact that they may be like fertilizing principles that exist in nature in a state that render them of no use, because they are not in a condition to make food for, or be assimilated by, plants. Understanding is that which enables their possessor to make them of service in his every-day life, and as a small amount of fertilizer judiciously applied, may be of more real service than a large quantity used at random, so a little learning that can be used is better than scholastic acquirements with an unpractical mind. So, get education, knowledge and wisdom when thou canst, "but with all thy gettings get understanding."

BREVITIES.

We have endeavored in this number to catch up in our answers to questions.

During the last five years, W. C. Hart, of Walden, N. Y., has cleared, above expenses, $1,409.13 on his flock of fowls.

We take pleasure in calling attention to the card of our venerable friend, Mr. Conrad Wilson, in our advertising columns.

Goat's milk for puppies is recommended by those who have tried it as quite superior to cows' milk, as the latter causes worms. This makes another point of utility for the goats.

We learn from several sources that Mr. Orange Judd is an applicant for the position of Commissioner of Agriculture in case of General Le Due's removal. If the administration were in need of an advertising agent, Mr. Judd would, no doubt, prove the right man. But he can have little practical knowledge of the agriculture of the present day, and as to botany he could not distinguish a crucifer from a composite. We were glad when he was appointed Indian Commissioner as we had hoped that some Indian might catch him and carry him off.

The "Slaughter of the Innocents" at Scranton, recently, when a score or more of little children perished from suffocation in the dormitory of a burning asylum, being unable to escape because they were locked in—was but the oft-repeated horror—except on a larger scale—of children being locked in houses and burned to death. Every generation seems to produce a crop of fathers and mothers who leave their little ones at home alone, and from some rather vague reason, lock them in, for greater security, as though any foe from without could equal the fire-fiend within. Children should be trained from infancy to know what to do in case of fire, be made familiar with the different ways of escape from a house, and above all, to know precisely what to do, in case their own clothing, or that of another child, takes fire. Also servants and all employes about a house should, from the outset, be so thoroughly drilled as to their action in case of one's clothing being ignited, that there will be no possibility of any one of them repeating the fatal folly of rushing into the open air in flames.

We notice that the English agricultural papers are beginning to recommend pretty strongly the importation of our trotting stallions for the purpose of improving their roadsters. Many of this class of horses now bred there, being got by weakly, spindle-legged, cast-off thoroughbreds out of common mares, are wanting in power, endurance and good action—too weak for farm work, and not strong and fast enough for the carriage. The American trotting horse, Shepherd Knapp, taken to England some years ago, has been well patronized there, we are informed, and has produced excellent road stock. The stoutest of trotting stallions not less than 16 hands high, and weighing about 1,200 pounds in good working condition, should be selected for the British market. The very fastest are not required. Those equal to a three-minute gait for a single mile, or 12 to 15 miles within the hour, would be quite as satisfactory as, if not more so than, any still faster. England doesn't want these horses for sporting purposes, but for utility—for the carriage and the cabriolet of the gentleman in the country, and the cab of the professional, such as the physician and others, in town and city.

Mrs. Hayes is a refutation of the saying that "a prophet is not without honor save in his own country," as she retires into private life crowned with the laurels of her countrymen and countrywomen's hearty acknowledgement of high service nobly done. Admirable as her conduct has been, it has been fully appreciated, and she had no lack of encouragement in upholding her sturdy principles of right. It speaks well for a country when it responds so quickly to a noble impulse, and it was a great compliment to the hostess at the White House, that she managed her campaign with such tact and womanly charm as to win as well as not to alienate friends. The portrait of her that her admiring and approving countrywomen have had hung in the Executive Mansion as a memorial of their high regard for her, is to be surrounded with an oaken frame, carved by the deft fingers of the women wood carvers of Cincinnati. The portrait is painted by Daniel Huntingdon, of New York, which is the only infelicitous feature of the memorial. Not that Mr. Huntingdon does not paint well, but that there are several women in the country who are fine portrait painters and from every standpoint, the work should have been given to some one of them.

The Hog Cholera Scare has been the chief object of agricultural interest on both sides of the Atlantic during the past week. In the British Parliament a discussion arose last Thursday as to the danger to the community from eating American pork, and during the progress of the debate a forged telegram was received in the House from Liverpool, insisting on the widespread prevalence of the disease here and the necessity for prohibiting the importation of hog products from this country. The author of the forgery has not yet been discovered. Secretary Blaine has protested against any hostile action by the British Government, insisting that the rumors of disease among our swine are grossly exaggerated. The British Minister at Washington is also reported to have sent reassuring messages to his government; the principal Chambers of Commerce through the country have also declared their belief in the exceptional freedom of our swine from disease just now; there has been a great deal of cablegramming on the subject between this country and Great Britain. The Belgian Government, too, has made inquiries about the matter with a view to future action. Three cases of death from trichinosis are reported, one from Ireland and two from France. There are good reasons for believing that the present "scare" is mainly due to speculators who wish "to bear the pork market," that is, to lower prices of hog products. As there is really no special cause for it, it cannot last long, although it is inflicting much injury upon our trade at present, and is likely to have results injurious to our swine husbandry.

Arboricultural.

FOUR NOTEWORTHY PLANTS.

One of the handsomest shrubs known to us, and one which escaped mention in our Special Hardy Shrub and Tree Number, is the

Double Red flowering Thorn—Cra'ægus coccinea flore-pleno. The engraving will impress those who have never seen the shrub in bloom as being somewhat too regular to be true to life. Such, however, is not the case. The flowers grow in umbels, as shown, and forcibly remind one of the trusses of some of the double-flowering pelargoniums of comparatively recent introduction which are really miniature bouquets in themselves. Each flower is perfectly double, of a rose color rather than a crimson—as is generally stated—and they begin to bloom in late April, lasting a full month. This shrub is perfectly hardy at the Rural Grounds, and all that can be said against it is that it seems so to burden itself with flowers one season that it oftentimes fails to bloom the next. There are several other very showy thorns which, if grafted upon one stock, would form a curiously interesting and beautiful tree while in bloom. Thus the double white, scarlet, red, white and rose might be used for the purpose—all worked upon the Common Hawthorn—Cra'ægus Oxyacantha.

Cornus florida.—The White-flowering Dogwood is not, strictly speaking, white-flowering, since the true flowers are of a greenish color. These are to be seen in the center of the inflorescence shown in the engraving, forming the little crowded heads resembling a dozen beads in a cluster.

The large, white leaves subtending these true flowers form a four-leaved floral involucre which in this dogwood is called the flower and, in fact, is just as showy as if it were. During a visit South last Spring we called attention to a tree, discovered by our contributor, Hon. H. W. Ravenel, of South Carolina, that bears red involucres. We trust some of our nurserymen have secured it for propagation.

Among dogwoods let us say that the Variegated Cornelian Cherry is one of the best of variegated shrubs, for the reason that its variegation is exceptionally constant. It holds its leaves well, and in October a purple color appears so that they are then green, purple and white. This is known botanically as Cornus mascula variegata.

The Double White-flowered Horse-chestnut.—The engraving shows the raceme of flowers and leaves about one-fifth the natural size. We have never seen this tree, but it is highly praised by those who have. Mr. Scott says that the flowers are borne in larger racemes than on the species and set with equal or even greater abundance on the tree. It blooms also two weeks later. This is a variety of Æsculus Hippocastanum—the Asiatic or Common White-flowering Horse-chestnut.

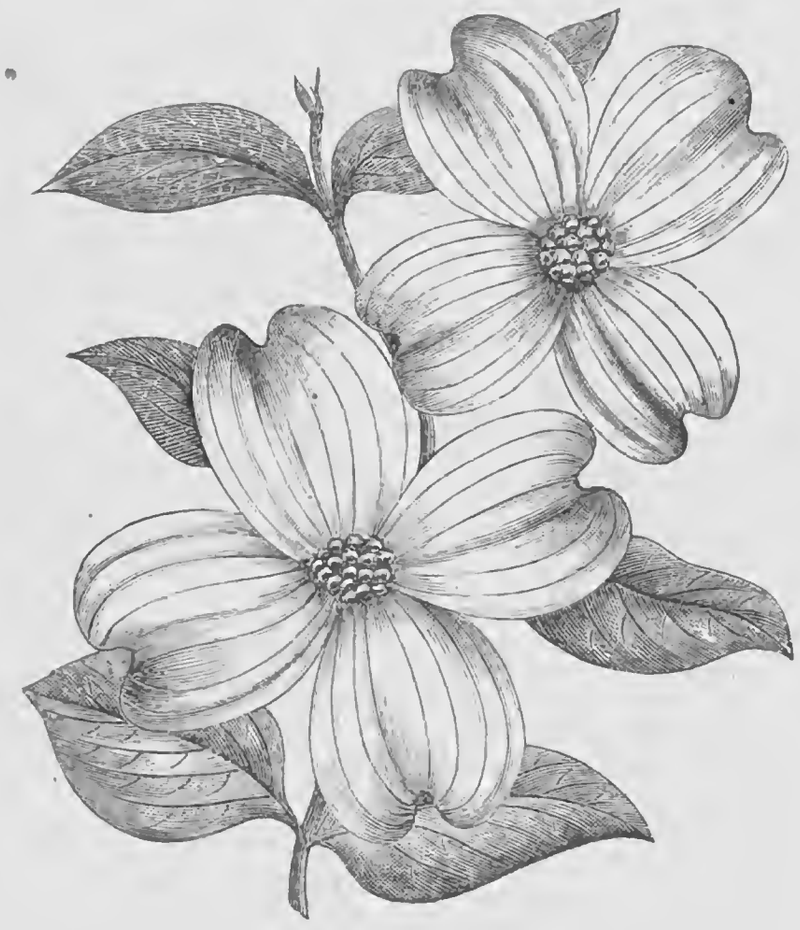
The Tri-colored Maple.—One-third the natural size the leaf shows, though not very definitely, the variegation of the Acer psendoplatanus tricolor. The yellow and green are well defined in the leaves, but we have never discovered the *third* color, viz, red, which gives rise to the varietal name. It is one of the best variegated-leaved trees we know and, being of rather slow growth, is richly entitled to a place in all home grounds of limited extent.

We acknowledge our indebtedness to Messrs. Ellwanger and Barry, of the Mount Hope Nurseries, of Rochester, N. Y., for the use of these cuts.

Everywhere.

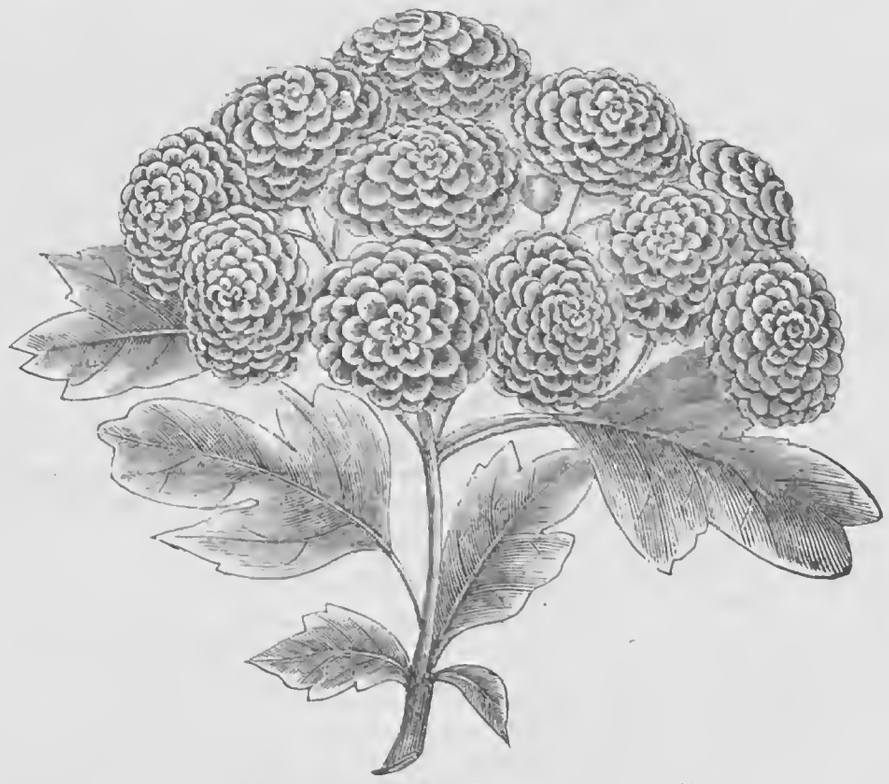
RURAL SPECIAL REPORTS.

Alabama, Selma, Dallas Co., Feb. 28.—We had a very severe Winter, with much freezing and snowing until the last couple of weeks, during which the weather has been fine for plowing. A great deal of oats has been sown, and most farmers have already finished the work. A great many sorts of oats were for sale here, but they were so very poor, badly mixed and light that I wouldn't sow either of them on any account. I have the heaviest oats in this county, having saved the seed for several years in succession. Most of the sort sown here is full of cheat, but the people pay little attention to the care of seeds of any kind. Last year I planted cotton for the first time. It was a bad year for the staple generally hereabouts, but folks said mine was the best; but I never worked so hard as I did to make this crop. Very little corn was raised here last year. I am now feeding the Blount Corn, which did well, considering the season we had. I have saved plenty of seed for the next planting, from that sent me by the Rural. I had strawberries in November, December and January. I haven't seen any berries this month, but the vines are in full bloom. So are our peach trees; indeed, everything is getting ahead nicely now. The main trouble with our farmers is that they all depend on one crop—cotton. This they sell, so that they have everything to buy. I find myself doing much better by engaging in mixed husbandry—raising some of several sorts of crops, for which there is always a ready market right at home. Then I deliver milk twice a day in the city; sell some hogs, having a nice lot of Poland-Chinas; raise vegetables, fatten cattle, and do well generally. J. M.



CORNUS FLORIDA.—FIG. 162.

DOUBLE WHITE-FLOWERING HORSECHESTNUT.—FIG. 163.



DOUBLE RED-FLOWERING THORN.—FIG. 164.

Ill, Belvidere, Boone Co., March 1.—We have had for the most part a very cold but pleasant Winter. Stock is wintering extremely well. Dairying is fast becoming the principal business here. Butter and cheese factories are plentiful, and all seem to be doing well. Many farmers are keeping Winter dairies, and think they pay better than Summer. Good cows are worth from $35 to $50 each. Fodder is abundant yet. Crops and prices were good the past season and farmers are doing well. Present prices are: Butter—creamery, 31@33½c.; dairy, 22@25c.; cheese, 8@11½c.; hogs, $4 60@4.70; cattle, $1 50@4 25; corn, 30c.; oats, 28c.; clover seed, $3 59@4 50. C. P.

Ill., Baileyville, Ogle Co. Feb. 21.—Had a moderate rain and thaw here on the 7th, 8th and 9th insts., the only thaw since November. Our heaviest snow storm came on the 11th and 12th insts, which snow drifted badly, blocking railways and common roads for several days. Good sleighing now. Fat hogs have nearly all been sold; they are now worth $5.10 per 100 pounds. Beef cattle are selling freely at from $3 50 to $4 per cental. Grain is improving in price, and farmers are hopeful of prosperous times. Business is brisk. W. B. D.

Ill., Fredericksville, Schuyler Co., March 1. We have had a very cold Winter here, the mercury ranging from 10° above to 22° below zero. The earth has been covered with a sheet of ice which, in its turn, has been overlaid with a counterpane of snow most of the time since about December 1. The weather has moderated of late, however. W. L. M.

Kan., Guilford, Wilson Co., March 4.—A snow storm that was extremely severe on live stock swept over this section for 24 hours on Feb. 10. Just before it we had a heavy downpour of rain for the same length of time, and before that stock water was so scarce that in many places animals had to be driven two or three miles to water at the deeper or larger streams. Winter wheat looks very well considering the dry season we have had. The acreage is larger than last year. No 2 wheat is worth 80 cents; corn 25 cents. A. G. B.

LEAF OF ACER TRICOLOR.—FIG. 165.

Kansas, Neodesha, Wilson Co., Feb. 28.—It snowed here all day on Feb. 11 and 12 and the snow is drifted five and six feet deep. The wind was very strong and came from the northwest—intensely cold and hard on stock. On Feb. 5 and 6 it rained continuously, making all cattle and hog lots knee-deep in mud, and then came the snow on top of that. It looks now as if it will be a fortnight before any plowing can be commenced. J. C.

Kan., Iola, Allen Co., March 3.—We have had a very severe Winter for this State. Wheat is not hurt as much as was expected; indeed, it is good as yet. The weather still remains very cold and unsettled. H. M. S.

Mich., Evarts, Oceola Co., Feb. 28.—There are thousands of acres of land here that would make homes for the poor, and it is cheap—from $2 50 to $10 an acre, and good land, too. There is also plenty of work. Lumbering is the principal business, and workmen are now paid $26 a month and board. Wheat went into Winter in good condition last Fall, for the ground had not frozen when the snow fell, and this has covered it ever since. We have had sleighing for about 115 days and have had only two thaws this Winter. I don't think small fruit has been hurt, for the snow has kept it unhurt. C. C. V. H.

Mo, Kent, Newton Co., March 1.—The weather croaker here can now say of a truth that this has been the hardest Winter he ever saw in his life. At least, the oldest settlers in this part say it is so. The first cold spell we had in November killed all the peach trees and most of the apple trees. I also notice that the bark is dead on small oak trees. The wheat is all right yet, as the ground has been covered with snow. C. C. E.

Neb, Wood Lawn, Lancaster Co., Feb. 23.—Since it is decided that flat cultivation of all crops is the best, and I think I can raise more corn in drills than in hills, how can I cover weeds growing in the rows and keep the field level? I would very much prefer the level to the ridged cultivation if I knew how to do it and kill the weeds. I managed my corn thus last year: After it was drilled in, I put my team to work on it with the harrow until it was nearly out of ground; then let it rest until the plants were well up so as not to cover them up; then harrowed again until it got too large so that the plants would break. Then I put in Frost & Bradley's riding cultivator, "Garden City," four shovels, two on each side of the row, turning the shovel nearest the corn to throw dirt away from the row; enough earth falls over on the row to cover all small weeds then started; the other shovel I turn to the corn and cultivate shallow. The second time I turn both shovels to the corn and cultivate deep enough to cover weeds. The third and last the same as the second, but, of course I must plow deeper, and that ridges up very much and leaves the field in bad shape for the next

plowing. Please tell me how to avoid the deep plowing and ridging and still kill the weeds.

D B M.

[We use a shallow cultivator as shown and described in the Corn Number. The horizontal blades destroy the weeds between the rows. Hand cultivation is the only answer we can give.—Eds]

N. Y., Afton, Chenango Co., Feb. 25.—We are having a very severe Winter in this section. The snow is about two feet six inches deep in the woods. Hay is worth $14@15; oats, 40c.; corn-meal and feed, $25@30 per ton; buckwheat, 55c.; potatoes, 38@40c. A desire is springing up among the farmers for better farming and greater improvement of farm stock of all kinds. A number of the wealthier farmers are getting thoroughbred stock. This seems to be the case generally all over the country, owing greatly to the agricultural press. We must have better dairies to compete with the oleomargarine trade. There is quite a little activity in the lumber trade; people seem crazy to get rid of their timber. The time is coming when timber will be scarce and high, if farmers keep on selling it around here for the next five or six years as they have been doing for the last five or six. There will not be timber enough left for building purposes and for fencing. G. E. N.

N. C., Brookston, Warren Co., March 1.—The early peaches are nearly all "gone up the spout." Common late seedlings seldom fail, and, by the way, don't you think that is the sort that has failed "but twice in fifty years" in that much-lauded Thermal Belt? I asked Dr. McAboy in reference to that; but he evaded a direct answer. M. B. P.

Ohio, Middle Bass, Ottawa Co., March 1.—Our Catawba and Delaware Grapes have been much injured by the extreme cold, so that it is hardly possible we can have a crop the coming season. Concord, Clinton and that class are uninjured. G M H.

Ohio, New London, Huron Co., March 5.—Wheat is as yet unhurt by the Winter, though it has been very dry since sowing. Good hay is worth from $12 to $15 per ton, it having been rather a better crop here than at most other places about us. Corn was a very good crop. Oats started to be very heavy, but rust made the berry very light. Potatoes were rather light. Wheat was a very fine crop. Factory cows paid from $40 to $60 per head; but dairy cows paid somewhat less where butter alone was made. Black leg slaughtered some calves here last Fall. I lost three and I charge the loss to neglect to let them have plenty of salt. These were the first I have ever lost by this complaint, and the first that ever went without salt once a week at least. The rest of the herd, four in number, came out all right from among their dead companions, as they were fed heavily on salt. Now, ye knowing ones—farmers of experience—tell us, through the good old RURAL, is not salt a preventive of this calf-killer? How many farmers are in the habit of salting their calves as they do their other stock. If this is an error, combat it; if truth, brace it up! BUCKEYE.

Pa., Berlin, Somerset Co., March 1.—We have had a splendid Winter; snow fell on Dec. 20. and the grain has been covered ever since; we could sleigh from that day until this, and it goes very well yet. This is a great maple-sugar country, and the farmers are all waiting for it to get warm so they can make something out of that before Spring work comes on. The price of the sugar is from 10 to 12½ cents per pound, and some farmers realize a handsome profit from it. S. B. P.

Wis., Albany, Green Co., March 3.—One of the meanest things to be seen all through the country at this cold season is the poor fowls sitting in the tree tops until they fall stiff and dead. Winter wheat brings 75c; Spring wheat, 60c.; oats, 27c.; corn, 30c; potatoes, 25c.; butter, 25c.; eggs, 22c. W. L.

BOOKS RECEIVED.

(See page 191 for other notices of books received.)

We have received from A. R. Foote, of this city, a copy of a petition which will soon be presented to the Legislature of this State, asking that, by proper legislative enactments, Bureaus of Statistics, Laws and Information be established—first, for all corporations representing capital only, in which the control of the corporation is determined by one vote for each share of capital; second, all corporations representing humanity only, in which the control of the corporation is determined by one vote for each member, said vote to be cast in person; third, that this bureau include in its duties the collection of statistics and information relating to industries and employments and the well-being of wage-earners generally; fourth, that these bureaus be placed under the executive administration of one or more commissioners for each, having full authority.

REPORT OF THE KANSAS STATE HORTICULTURAL SOCIETY FOR 1879. This work of 460 pages, octavo, is excellently gotten up, and contains a great wealth of horticultural information about Kansas. It contains reports of the proceedings of the State Horticultural Society for its ninth semi-annual meeting held at Beloit, June 17, 18, 19, and of its thirteenth annual meeting held at Holton, December 16, 17, 18, 1879, together with the proceedings of Division, County and local Societies.

The Querist.

Farcy—Early Symptoms of Contagious Pleuro-Pneumonia.

M. O. C., Gibbon, Neb, asks the cause of, and a remedy for, sores on his horse's leg. There are three on the inside of the ham, two below the pastern joint, and indications of several above. They commence as hard lumps, the size of a hickory-nut or less, and break; but there is no discharge of pus, but merely a raw surface sticking out like a wart, which refuses to heal, and bleeds when the scab is removed. The horse is in first-rate condition, feels well, and is not lame; but the leg stocks and sores are very tender; 2, what are the symptoms observable to the non-professional in the first stages of pleuro-pneumonia among cattle, and what remedies should then be applied; 3, by whom and for what price is any paper published in the interest of veterinary practice.

ANS.—1. On reading the customary symptoms of farcy in our last issue, our friend will see that he describes the symptoms of that disease. As there stated, farcy and glanders are one and the same disease, dependent on the same cause, namely, "a specific blood poison;" but each has a different manifestation, glanders showing ulcers on the nasal septum, discharge, etc., while farcy shows itself on the line of the lymphatics in small tumors on parts of the body, notably on the inside of the hind legs. This disease is highly dangerous to man and other animals; for if any of the pus from these tumors should get on a man's hand on which there is a recent cut, and thereby be absorbed into the system, it would be sure death. This animal should, therefore, be destroyed, and the stall, harness and everything that he came in contact with should be disinfected before allowing another horse to come in contact with them. If the owner is not satisfied that the disease is glanders or farcy, let him inoculate some old, worn-out horse with the virus from one of these tumors, and he will find out in two weeks that he has transmitted the great scourge of the horse. It *cannot be cured* in horse or other animal. Farcy runs its course until glanders develops, which will close the scene. Many men have died from this disease, contracted from the horse. In the interest of our friends, therefore, we are anxious that each should be able readily to distinguish the malady, and should know why, for his own sake and that of his neighbors, he should at once get rid of the afflicted animal. 2. The earliest noticeable symptoms are chiefly the following:—There is a slight rise in the temperature, discernible by the use of the thermometer. Should the temperature of a healthy animal, for instance, be about 100°, that of an infected one would, at this stage, range from 102° to 104°. At the same time there is a slight loss of appetite; a decrease in the flow of milk; rapid respiration; faintly, unusual sounds in the bronchial tubes; a peculiar grunt when forced to move; a dribbling of saliva from the mouth; a slightly accelerated pulse; often an occasional shivering fit; rarely a slight, hard, dry cough, especially after drinking; a disposition to keep apart from the rest of the herd, and, if pregnant, abortion. Like consumption in human beings, this disease cannot be cured; yet all cows suffering from it do not die, for nature incloses the diseased lung with a membrane, and in favorable cases the other organs of the body return to their normal functions. Still the recovered animal is not cured, for she has the effects of the disease inclosed within her body; and many instances are on record where a recovered cow has carried this disease into healthy herds a year after such recovery, and all this time she appeared perfectly healthy to non-professional eyes. There is, therefore, no cure for this malady, and the sooner the Government takes the matter in hand and stamps out this terribly fatal scourge the better it will be, not only for the Eastern States, but for the whole country, else we shall soon come to the condition of Australia, where it is an impossibility to control the disease, owing to the wild state of the country and the wide range afforded cattle. 3. The "American Veterinary Review," published monthly; $4 per annum; A. Liautard, M. D. V. S., editor, 141 West 54th Street, New York.

Very Hardy Flowering Shrubs.

A Subscriber, Fayette Co., Ia., writes us:

"In looking over the columns of the RURAL'S hardy tree special, it seemed to me that I was learning more of tree culture than could be learned by observation in a year. Still I am in doubt as to the hardiness of many (most) of the flowering trees and shrubs, and the thought, will they stand Iowa weather? puzzles me. The present Winter has given us three months of severe weather already, with no prospect of warming up at present; the thermometer has stood as low as 38° once and at 20° for several days at a time. I have been a resident of Northern Iowa for fifteen years and have never seen only one year in that time during which the mercury sank as low as 30°. Will you please give a list of shrubs and vines that will stand such weather, if there are any except natives.

The Iowa farmer's first tree planting is usually White Willow for wind-breaks; then a few apple (and the hardy ones are few) Cottonwood, Soft Maple, Box Elder and a few native pines, if they can be obtained. Shrubs are confined to lilacs and snowballs."

ANSWERED BY ELLWANGER & BARRY, ROCHESTER, NEW YORK.

It is very difficult, without actual experiment, to name any considerable number of flowering shrubs that will endure a climate where the mercury frequently falls during Winter to 30° below zero. We will name a few that we think will stand, but they will be much more likely to do so if sheltered from the prevailing Winter and early Spring winds, and planted on dry ground where they will ripen their wood well. This is important, because on the rich, moist prairie soils plants grow so late and so succulent that even very hardy things get winter-killed. Then a little protection for the first, and perhaps the second Winter would not be amiss.

Plants when well rooted and established in the ground can resist cold much better than those whose roots are near the surface. But we would say to your correspondent that even if all these which we are about to name should succumb and he were to fall back on his lilacs and snowballs, he would not be as badly off as he might be. He may have twenty varieties of lilacs if he chooses, white, red and purple, with all intermediate shades and a great variety of foliage and habit of growth. If he will plant twenty or, better still, fifty of these (in groups of a dozen), and mix with them the snowballs and other viburnums equally hardy, he will have a display worth a journey of many miles to see. However, we think the following if properly managed, as we have suggested, will stand by him through his hardest Winters:—

Berberry (Canadensis), our native; Cornus (Dogwood), Red-branched and Variegated-leaved; Deutzia, scabra and crenata: Lonicera, the Upright Honeysuckle, all the species and varieties; Philadelphus (Syringa or Mock-orange), several species and varieties; Spirea—Billiardi, crenata, obovata, opulifolia and its golden variety, perhaps, some others; Lilacs—twenty or more species and varieties, all beautiful and fragrant: Viburnum—lantanoides, prunifolium, rugosum, Opulus (the High Bush Cranberry) and Opulus sterilis, the snowball.

HARDY CLIMBERS.—Ampelopsis (quinquefolia), the "American Ivy." Honeysuckles—The common Woodbine; the Scarlet Trumpet; the Yellow and the Canadensis—perhaps others. Among flowering trees which will stand, we would suggest the thorns and Crab Apple.

Your correspondent, even in his very cold climate, might succeed with many fine shrubs, not named above, such as Weigelas, etc., etc., by giving them some protection in Winter. We advise him to try them; it will not cost much.

Club Root in Cabbages.

A. O., Meadville, Pa., asks the cause of, and remedy for, club root in cabbages.

ANSWER BY G. H. FRENCH.

"Club root," or "clump root," is a disease affecting the roots of cabbages, causing them to be very much enlarged. One writer says it is caused by the larva of a small beetle boring and burrowing into the roots soon after they are transplanted, or it may be later in the season. Another writer attributes the disease to the larva of what is known as the cabbage fly (Anthomyia brassicæ), working in the same manner in the roots. Without arguing as to which is correct, it is evident the disease is caused by an insect. The malady is found to be most common on ground that has been set to cabbages every year for a number of years, while the cabbages are seldom affected with the disease when set on new ground, or when alternated with some other crops. This suggests to us the most easily applied remedy—that of not raising cabbages on the same ground during successive years. A great many things have been applied as remedies to but little purpose, usually because the damage is mostly done before the presence of the disease is suspected, and therefore the remedies are applied too late. One writer states "that he has found by long experience that club root in cabbage can be remedied by boiling leaves and twigs of the scarlet-berried elderberry to a strong decoction, and pouring a gill, cold, on the center of each plant. One application is generally sufficient." The English, I am told, guard against all kinds of root-eating insects in cabbages by the following method: Before each plant is set its roots are wet and then dipped in soot, after which they are set in the ground as usual. This makes a more or less complete coating of soot around the roots. This serves to keep away insects, it being distasteful to them, and if not too strong serves to invigorate the growth of the plant.

Fertilizer Queries.

A Subscriber, Norwich, N. Y., asks, 1, what is the value of night soil as compared with horse and cow manure, and how should it be used; 2, what is the value of the scrapings of hides from tanneries—hair and lime, mostly; 3, what would be the effect of plaster on horse manure and straw as the stuff comes from the stable. 4, Referring to a recent article in the RURAL, under the caption, "Manure against Humus," he asks whether $100 could be more profitably spent in producing nitrogen, phosphoric acid and potash by purchasing grain, linseed meal, cotton-seed meal and wheat bran to be fed to farm stock, than if the same sum were paid directly for commercial fertilizers.

ANS.—1, There is very little difference between night soil and animal manure. The following figures will show the relative fertilizing values:

In 1,000 pounds of	Nitrogen.....	Phosphoric acid.....	Potash.....
Mixed barnyard manure, fresh.....	4.5 lb.	2.1 lb.	5.2 lb
Fresh night-soil, liquid and solid...	7.0 lb.	2.6 lb.	3.1 lb.

Night soil is best used mixed with earth in sufficient quantities to make a dry mass. 2, This kind of tannery waste is usually sold at one dollar a two-horse wagon load of 40 bushels, which is about its full value; hair contains less than one per cent of ash and about 17 per cent of nitrogen, but the nitrogen is very slowly available. 3, The effect would be to absorb any ammonia that might be produced in the manure, and nothing more. 4, One hundred dollars spent in such feed as you mention would be of greater benefit than if spent in commercial fertilizers; a large portion of the feed would be returned in milk, flesh or fat, and the remainder would add largely to the value of the manure; the two returns together would be considerably more in value than the cost of the feed, always supposing that the feeding should be done skillfully and economically and the manure well saved and managed.

Manure in Texas, Etc.

R. B. A., Pipe Creek, Bandera Co., Texas, has the manure accumulated from 1500 sheep since 1878, and wishing to raise Chester County Corn, he asks, 1, how many two-horse loads he should put on per acre; 2, if onions will do well so far South, and when they should be sown to have them for sale in the Fall and Winter; 3, will small fruits, strawberries, raspberries, etc., thrive in that locality; 4, who has pure-bred American Merino sheep for sale, and how much will they shear per head annually; 5, is English rape good feed for sheep?

ANS.—1. It will depend entirely upon the present fertility of the soil. The virgin soil of Western Texas is, as a rule, rich, and does not need much manure. We should think that 25 or 30 loads per acre would be sufficient, or even less. 2, Onions will do well in your latitude. Sow the seed in January or early in February. Harvest the crop when it is ripe, and preserve them in a shaded but airy place till you wish to sell. 3, The climate in Bandera County is too hot and dry for small fruits. The plants will in all probability be killed by the sun during July and August. But try a few strawberry and raspberry plants, by way of experiment, and report the result to the RURAL. 4, J. M. Campbell, Tilden, McMullen Co., F. W. Shaeffer, San Diago, Duval Co., and George Reynolds, Penites, Nueces Co., Texas, are breeders of American Merinos. The average weight of the washed fleece is about six pounds per head annually; but occasionally we hear of a ram of extraordinary size and quality shearing 15 to 20 pounds. 5. Yes; especially for feeding in Fall or Winter or early in Spring.

Culture of Cucumbers For Pickles.

E. J. S., Oneida, N. Y., asks for information as to the culture and profit of cucumbers for pickles.

ANS.—The ground should be plowed once or twice in the Spring, and, if sod land, it should be turned over the previous Fall. After the middle of June furrow out the field, having the furrows from four to five feet apart. At a distance of four feet apart, in these furrows, make the hills, and in each hill put a shovelful of well-rotted manure, over which throw a little earth, and on this plant the seed. The cultivator may be used in cultivating, though the work around the hills requires the hand-hoe. When the vines begin to run, pinch them off at the third joint and the crop will be increased. For pickles the seed should be sown the latter part of June or the first of July. The best variety for this purpose is the Green Prolific. It is well to plant plenty of seed as the "striped bug" may destroy some; and when the vines begin to run, all but three plants to a hill may be pulled up. Fine bone-flour sprinkled on the hills every day or two often rids the vines of these pests. A solution of tobacco put on the vines in the early morning and then a sprinkling of bone-dust are effectual, but there is nothing better than flour of sulphur mixed with plaster or finely-sifted coal ashes. We have no statistics at hand concerning the yield, cost and profit per acre, farther than that a large grower on Long Island realized a profit of from $125 to $150 per acre, when the cucumbers were contracted at $1.75 per thousand.

Gas Wells.

A. M. T., Farmington, W. Va., asks, 1, the address of some persons likely to purchase coal lands; 2, in a neighboring creek the water boils up in several places accompanied with gas that ignites readily, and our friend asks whether this is a sure sign that petroleum exists below, there being a petroleum well six miles away; 3, is there any means of analyzing gas, and if so, how should it be confined for transportation to the place of analysis.

ANS.—1. Write to Mr. B. R. Western, coal editor of the Mining Record, 61 Broadway, New York. 2. No. There are gas wells which produce nothing but gas, but it is a favorable indication of the proximity of oil. 3 Gas can be readily analyzed. A sample can be procured by inverting a bottle in the spring; the gas which enters the bottle will drive out the air and by keeping the bottle mouth downwards until it is corked tightly, the gas can be secured. If you want the gas analyzed it can be done for about $5, through Mr. Western, the above-named. But it will be hardly worth while. The gas is a common product and is simply carburetted hydrogen with varying proportions of carbon in it.

Alfalfa.

S. E. S., South Livonia, N. Y., having seen an article from the RURAL attached to a circular about Alfalfa, asks for further information about that fodder plant.

ANS.—Alfalfa needs a rich, well-drained soil. The plant, unlike our red clover, is perennial. It makes a comparatively feeble growth the first season and should never be cut or pastured. It spreads less than red clover and requires, therefore, more seed to the acre—not less than 15 pounds. It succeeds admirably in California and Kansas, and is being tried in Northern and Eastern States. We know of one instance where it is doing well in Southern Canada. It will endure any amount of drought, as its roots extend to a great depth in the soil. We should have no fear as to "getting rid of it" by plowing. In Kansas Professor Shelton informs us that he cut "four large crops from the same ground" in 1879. The ground should be thoroughly prepared, the seed harrowed in and rolled.

Digestibility of Foods.

F. W. L., Smith's Grove, Ky., asks whether we have any data as to the time it takes cattle, horses and sheep to digest hay, straw and fodder corn.

ANS.—For very obvious reasons it is impossible to arrive at any direct knowledge of the time required for the digestion of the foods mentioned. The nearest approach to it is in those few cases in which post-mortem examinations have been made of healthy animals that have been slaughtered. It has been observed by butchers that food is present in the stomachs of ruminating animals 12 hours after they have been fed; while it is known that a horse digests his food much more rapidly. In Dr. Beaumont's well-known observations made directly upon the stomach of a living man, which had been opened by an injury and had healed, it is recorded that cooked corn-meal was completely digested in four hours and fifteen minutes. From the well-known periods of the returning appetite of a horse there is reason to believe that a meal of hay or other fodder and corn or oats is digested in four or five hours. A cow or ox requires longer than this to completely digest the food, as the process of rumination occupies a considerable time. It is one of those subjects upon which we shall perhaps never have precise data.

Bitter Milk from a Farrow Cow.

H. G. C., Watkins, N. Y., has a farrow cow that gives bitter milk; some time since he saw in the RURAL a recommendation to give one ounce of saltpeter a day in a like case; he has tried the recipe for two weeks with very little benefit. He has been feeding corn-stalks and a little straw with one quart of buckwheat each day, and he asks for some preventive of the bitter milk.

ANS.—Nothing that you could give the cow could change the natural effect of the poor feed you are giving. "Nothing can come of nothing," and it would be difficult to find a poorer feed than you are using. Buckwheat is the worst possible feed for milk and butter, and straw and corn-stalks are very poor fodder. If you were to cut up the corn-stalks and straw, and give the cow two or three quarts a day of corn meal, it might avoid the defect complained of. But a farrow cow's milk may be bitter in spite of all treatment and devices, because the condition of the cow may cause it, and that may not be helped probably. But to feed a farrow cow on poor feed is provocative of such trouble.

Cleaning Pearl Millet Seed.

M. S., Kansas, asks how to clean seed from the heads of Pearl Millet.

ANSWERED BY W. B. JONES.

In the absence of a power "machine" for cleaning the Pearl Millet seed, the simplest way of doing it is by use of a common horse curry-comb. Place the heads of millet on a board or table and pass the curry-comb gently along them, combing off the seed from the husks. Some one should devise a machine for cleaning this admirable grain and make money out of it. I have one, but it is not perfected in the mechanism, yet it daily does the work of cleaning from 30 to 50 bushels. This grain cannot be thrashed or treated like any other. It must be taken off by the combing process. Some instrument or machine with revolving teeth would be the right thing. Pearl Millet as a green soiling forage plant for all the Southern and Middle States on rich, sandy soils, exceeds any plant yet tried, and must become a favorite crop in the future of soiling and ensilage. [A trial of the Rural Branching Sorghum may change Dr. Jones's opinion.—EDS.]

Hen Manure and Ashes.

T. P. D., Ostreme, Mich., having a quantity of hen manure and wood ashes, asks how to apply them, with best results, to corn—would it be best to mix them and apply them in the hill and then plant, or would it be better to sow them broadcast before the last dragging.

ANS.—In no case should the wood ashes and hen droppings be mixed for any length of time before they are used, as the former would liberate the nitrogen in the latter, most of which would go to waste. If mixed just before application, however, the soil would retain the liberated nitrogen. Unless land is very poor and manure scarce we *never* advise manuring in the hill. Hill-manuring helps young plants, but renders the least assistance when assistance is most needed. You need not be afraid of sowing too much broadcast. The proper quantity would depend entirely upon the fertility of the soil. It *may* be that your land does not need potash. Try on one part the hen manure and on another the ashes.

A Recipe for Making Posts Durable.

W. D. I. Yakima, W. T., asks our opinion as to the value of the following recipe for making posts durable:—"The American Chemist says that a Western farmer discovered many years ago that wood could be made to last longer than iron in the ground. Time and weather, he says, seem to have no effect on it. The posts can be prepared for less than two cents apiece. This is the recipe: Take boiled linseed oil and stir in it pulverized charcoal to the consistency of paint. Put a coat of this over the timber, and, he adds, there is not a man who will live to see it rot."

ANS.—Wood is rotted by the action of the air and moisture. Any substance which will tend to prevent this action will in the same measure preserve the wood. To what extent the above recipe will effect this can be ascertained only by experiment, and we know of none having been made.

Using Refuse Animal Matter as a Fertilizer.

S. E., Saugus, Mass., has 100 tons of the refuse from a glue factory, including the residuum after the extraction of the gelatine in glue-making, and chippings of the skins of animals with some of the hair on them, and he asks how to compost it so as to fit it for fertilizing purposes more speedily and economically than by mixing it with muck.

ANS.—Under these circumstances there is no occasion to undertake the heavy labor of composting all this 100 tons of valuable fertilizer in the way you propose. You can more easily arrive at the same end by spreading it directly on the soil and plowing it in with a light lap furrow. Then the harrow will mix it with the soil and it will be the very best compost you could possibly make without the labor of mixing it and turning it and hauling three times as many loads to the field. Precisely the same end is reached in either way, and you had better choose the simplest and easiest.

Injury to a Horse's Knee.

J. F. A.,—address mislaid—says that about six weeks ago his mare, while pawing in the stable, struck her knee. It swelled to twice its natural size. He sweated the place with bran wet with vinegar in which smart-weed had been steeped. The swelling was reduced and the inflammation removed, but the large bone on the inside of the leg above the knee, and also the front of the knee, continue enlarged, and he asks what will reduce the enlargement.

ANS.—Rub the following ointment on the enlarged part: Cantharides, half an ounce; biniodide of mercury, two drachms, and lard, four ounces. Smear the leg *below* the blister with sweet oil to prevent excoriation from the product of the blister running down, and secure the animal so that it will be impossible to get her mouth to the blistered part. Repeat if necessary. Give a couple of weeks' rest.

Incipient Ringbone.

J. C., Stewart, Minn., has a valuable young mare on one of whose fore-legs a ringbone is making its appearance, rendering her very lame, and he asks how to treat it.

ANS.—Have a regular veterinary surgeon fire and blister the affected limb at once, and give two months' rest at grass; and, if any lameness remains, repeat the operation. If there is no competent surgeon at hand, take the following ointment, and, after clipping the hair short, apply with friction:—Cantharides, powder, half an ounce; lard, three ounces. Secure the animal so that she cannot get her mouth to the blistered limb; give rest as in firing, and repeat if necessary.

Feed for Cows in Winter.

J. C. K., Castile, N. Y., asks what feed is the best for milch cows in Winter.

ANS.—There is no better food than clover hay or well cured corn fodder, cut and well mixed with corn, oats and wheat or rye bran ground together in equal parts. Four to six quarts a day of this ground feed may be given to a cow that is milking well. If the labor of cutting and preparing the food is more than the extra milk is worth the feed may be given dry. But the cut and moist feed will add at least one-third to the quantity of milk and one-third less hay or fodder will be used.

Hardy Cactuses.

F. F. A., Loudonville, N. Y., asks us to name and describe the kinds of cactus that are hardy enough to stand the Winters of this State.

ANS.—Opuntia vulgaris, the common prickly pear; O. Missouriensis, which is thickly covered with tufts of bristles; O. Rafinesquii which is somewhat like vulgaris and several of its Western forms: also Echinocactus Simpsoni, a neat but rather scarce white-spined "pincushion" species; and Echinocereus Krausei, a handsome, red-blooming "bunch" cactus.

Miscellaneous.

W. H., Van Wert, Ohio, asks what percentage of nutriment is there in oat straw, turnips and wild prairie grass.

ANS.—The following table gives the information desired:—

Per cent of	Oat straw.	Turnips.	Prairie hay.
Total albuminoids, or flesh-formers	2.3	1.1	7.5
Digestible albuminoids	0.8	1.1	3.4
Total carbohydr's fat-formers, inc. fiber	36.4	6.1	51.7
Digestible carbohydrates	18.7	6.1	34.9
Total fat	1.0	0.1	1.5
Digestible fat	0.	0.1	0.5

It will be noticed that the whole of the organic matter of turnips is considered as digestible nutriment. It must be taken into account that these are combined with 88 per cent. of water, while the oats and prairie hay have but 14 per cent. This fact leaves the indigestible organic matter of turnips so small in amount as to be practically not worth considering. Taking account of the fact that turnips contain six times as much water as the other substances, they are seen to be much more nutritious in proportion to the dry matter.

A Subscriber,—address mislaid—has five fields for a rotation of crops for mixed husbandry, but he finds that he can never get enough of grass and he asks whether he should make another field, reducing the size, of course, of those he has now.

ANS.—The fault with a five-field rotation is that it is exhaustive of the soil and does not produce manure. It is necessarily confined to corn, oats, wheat, clover and grass, and these crops are totally inconsistent with good farming and the keeping of sufficient live stock. A seven-course rotation is preferable, and it may be worked on four fields very well by having three fields under two crops. This rotation would be wheat, grass, pasture, corn, roots or fodder crops, barley or oats, seeded to clover, and lastly clover. The advantages of this rotation are, two fields for hay and one for pasture, one field of roots or fodder crops, and two succeeding cultivated crops by which the soil is cleansed from weeds. These advantages are obvious. A five field rotation is but little better than a four field one, because enough cattle cannot be kept.

W. A. D., Clinton, Conn., says that a year ago he had some raspberry canes which he thought had gone through the Winter uninjured, but when they should have put forth leaves they failed to do so, as they had been badly winter-killed. Last Spring he bought from Mr. J. T. Lovett some Cuthbert Raspberry plants which were very fine and made a rapid growth. He pinched them back from time to time and consequently they grew stout, bushy canes. But seeing it stated, in our Special Small Fruit Number, that the Cuthbert had been somewhat injured in some places, and thinking, therefore, that he might be mistaken in his belief with regard to the safety of his own, he has cut off the tops of several canes and sent them to us for our opinion on the matter.

ANS.—The specimens sent us are not injured in the least.

N. B. B., Pittsburgh, Ind., sends us a piece of the small intestines of a sheep that died suddenly without having shown any noticed signs of sickness. The bit of intestine, like all other small ones, was covered with little hard lumps, and in one place a large hole allowed the food to pass through; at this place there was a large, soft lump; and our friend asks what was the matter with that unfortunate sheep. The village doctor says the intestines showed signs of typhoid fever, but our friend "can't see it."

ANS.—The village doctor is right; under the microscope the peculiar organisms present in enteric, intestinal or typhoid fever are abundant. The inflammation caused the rupture of the intestine which is always followed by death in a few hours. The lumps are old deposits, resulting from previous inflammation, and have no connection with the present trouble. They consist chiefly of phosphate of lime and are by no means uncommon in the viscera of animals.

S. C. West Northfield, Mass., asks, 1, how much ground planted to fodder corn will it take to fill a pit twenty feet long, twelve feet wide and six feet deep, or 1,440 cubic feet; and, 2, if such a pit were properly filled what would be the value of its contents as compared with that of hay.

ANS.—2, Green corn fodder packed in such a pit weighs one ton for every 47 cubic feet. The pit will therefore hold about 31 tons. This may be raised on one acre; it has been grown on half an acre; but can be easily grown on one, by planting any large kind of corn, as the Southern white or Western Dent corn, and manuring and cultivating it liberally. The feeding value, as compared with hay, must be estimated in proportion to the water contained in the corn, which is equal to 75 per cent. while in hay there is only 15 per cent. Otherwise the fodder is nearly as valuable as the hay.

H. S., Easton, Md., asks whether it is advisable to plant whole potatoes; he has always cut them to a few eyes fearing to have too many plants in a hill.

ANS.—A good deal has been said in our columns on this question, to which our inquirer is respectfully referred. Whole potatoes will give a larger yield of small potatoes. Single eyes, if placed eight inches or more apart in the drills will give a better yield of large potatoes. We made some very careful experiments touching this subject, at the Rural Farm last season, the result of which we publish in this issue.

J. D. K., Lebanon, Va., asks, 1, how far from the ground and from each other should the wires be paced in making a wire fence to render it effectual against pigs, sheep and other stock; 2, will cuttings of Osage Orange of last year's growth, grow, if planted, and when should they be cut and set out.

ANS.—1, The lowest should be six inches from the ground. This and the next should be one foot apart, after that it doesn't so much matter. 2. There are only two ways of making hedges of the Osage Orange—from cuttings from the roots and from seed. The method of making such hedges was described in full in the RURAL for May 22 '80.

G. H. Parkhurst, Kings Co., N. Y., desires to know if the Chinese Yam (Dioscorea batatas, we presume) would not be a good substitute for the potato which is now so difficult to raise on account of the bugs.

ANS.—No. This has been tried again and again. The roots are too tender and too long; they grow too deeply in the ground. The larger end is at the bottom and it is difficult, therefore, to harvest the crop. Besides, the taste is not agreeable to most persons. Its first value is as a hardy, herbaceous, ornamental vine.

J. W., Ripon, Wis., says that if we wish he will send on for trial a specimen of the Jordan Prolific Potato which does well in that neighborhood.

ANS.—Yes, thanks. We are glad to try all very promising things and to report upon them. It is the only way by which we are enabled to present our readers with *fresh, original*, trustworthy information regarding NEW things. But we beg of our friends not to send us new varieties which are plainly inferior to old kinds.

M. A. P., Sterling Station, N. Y., asks, 1, where can a Weeping Beech, like that figured in the RURAL of February 12th, be obtained. 2, Whether Blount Corn will ripen thereabouts.

ANS.—Of *any* of the nurserymen advertising in our columns. Send for their catalogues. 2, It is doubtful if it will mature. Could not you try a small plot? It ripened with us last year two weeks earlier than it did the year previously. Perhaps you could acclimatize it. Dr. Chamberlin, who raised the first-premium crop, advertises seed at Medina, N. Y., not far from your place.

A Subscriber, Smithtown, L. I., asks, 1, what kind of Spring wheat is best for Long Island; 2 whether Spring wheat makes good flour.

ANS.—We have tried many different kinds of Spring wheat, but have never been very successful with any. Spring Mediterranean and "China Tea," as it is catalogued, have proven best. Champlain and Defiance promised finely one season, but hot weather and frequent showers seemed to shrivel the grain. Yes, good Spring wheat makes good flour, especially by the "new process" milling.

B. P., Okolona, Miss., asks us to recommend a washing machine for a family of six.

ANS.—We cannot very well answer such questions satisfactorily, because we need the information which can only be gained by experience with many different machines. A friend, however, recommends the Erie and Keystone Washers made by F. F. Adams & Co., Erie, Pa. Another, the Nonpareil Washer; still another, the Doty made by the Metropolitan Wringer Co., No. 32 Cortland St., N. Y. Perhaps the Robbins would answer nicely.

N. A., Dillsburg, Pa., asks, 1, whether we have tried the Russian White Oats, and if they are good; 2, when a clover sod has been turned under for wheat, will clover catch again.

ANS.—1. No. We propose to try them this Spring. 2, Decidedly, yes. A clover catch depends upon the seed, the preparation of the soil, and the weather which follows. Some talk of a clover catch as if chance had to do with it. Clover is as certain to grow as wheat if the conditions are made as favorable.

H. Y., Concord, has a cow from one of whose teats pieces of curdled milk come once or twice a week, and he asks how to treat her.

ANS.—This is probably caused by a disordered condition of the blood, or it may be caused by congestion of the udder. Give the cow eight ounces of Epsom salts, and afterwards one ounce of saltpeter once a day for three or four days. If the cow's dung is hard or dry this should be remedied by laxative food such as bran, without corn meal.

S. H., Auburn, N. Y., asks, 1, what is the speediest way of restoring ammonia to charred bone and leather which had been used in case-hardening tools; 2, having received the White Elephant Potato, he asks whether it will be necessary to send more postage stamps to secure the rest of the seed.

ANS.—1. Mix them with blood, hen manure and muck, guano, sulphate of ammonia, fish, farm manure, or, indeed, any substance rich in nitrogen. 2. No. You have sent your share of postage; otherwise you would not have received the Elephant.

A Subscriber, address mislaid, asks whether English Walnuts do well in the latitude of Central New York.

ANS.—English Walnuts do not grow as thriftily in this country as in England, especially in the northern latitude. The nuts are of as good quality, but the trees do not bear as well as they do in a more favorable climate. With high culture and a sheltered location they would produce more than they usually do growing in lawns without any care.

G. G. B., Manchester, Vt., asks how much more per month for a year can a farmer afford to pay a hired man if he does not board him than if he does.

ANS.—It is very clear that the difference should be the value of the board. This is easily ascertained, and it should be added to the amount of the wages. A frequent rate of wages is $15 a month and board, and $25 a month without board, $10 a month being generally considered as the price of a month's board.

A. J. P., Johnston, N. Y., has a Japan Snowball which in Spring is infested with small green worms that do not eat the leaves, but cause them to curl and the blossoms to fall. They don't seem fond of Hellebore, and he asks for some remedy they would be likely to take to more kindly.

ANS.—Try a tablespoonful of Paris-green to a pail of water. Sprinkle the bush as if it were a potato plant.

A. M., Lomont, Mich., having 12 peach trees to set out the coming Spring, asks, 1, how early should he plant them; 2, whether he can find the RURAL at the newspaper offices; 3, what is the best fruit drier, and where can it be found.

ANS.—1. As soon as the frost is out of the ground until the buds begin to push. 2. Sometimes; not always. 3. We must refer you to our advertising columns. We do not know which is the best.

W. B. N., no address, asks, 1, whether there is any known complete and thorough protection for plums and peaches against the curculio, one that is inexpensive, easy of application and not injurious to tree or fruit; he says he has just such a thing, and asks, 2, whether it would be advisable to apply for a patent.

ANS.—1. No. 2. Yes, if you are certain as to its efficacy, etc.

W. S., Lincoln, Neb., says that some eight years ago he saw in Missouri a fence built of pickets wattled in between wires, and having been told it was covered by a patent he asks whether it is patented, as he wanted to build one like it.

ANS.—We have made some inquiries about this sort of fence; but can learn nothing definite. It is probably patented, however.

E. F. D. Lynn, Mass., asks what value as a fertilizer have wood ashes and charcoal (mostly charcoal) the remains of a burnt frame building.

ANS.—The ashes would have only the value of leached ashes, as they are leached we presume. The charcoal would have no value as a fertilizer, as it is insoluble; but on a stiff soil it would have some mechanical benefit in lightening it.

F. M. B., Bucklin, Mo., asks whether there is any preparation into which pine shingles can be dipped, to preserve them, without injuring the water from the roof for cistern purposes.

ANS.—To steep them in crude petroleum is the best; it would flavor the water, but after a time this difficulty would disappear.

R. M. L., Oakburn, N. Y., asks whether the firm of G. H. W. Bates, of Boston, who advertise violins for $3 50, is trustworthy.

ANS.—Allowance *must* in some cases be made for extravagant language in advertisements. A *fine* violin *can not* be sold except at a loss for $3 50. The firm is good.

J. M. M., Strawberry Plains, Tenn., asks whether there is in this market a grass called Oat Grass.

ANS.—We do not find any grass of that name in any of the seed-men's catalogues, nor is it quoted in any of the market reports.

C. P. R., Brighton, O., asks for a recipe for a cheap, light-colored paint for a board fence.

ANS.—The RURAL has given several within the past year. But we have had no experience with

such cheap paints. Would some of our readers who have had, kindly answer.

H. H. Allen asks why we cannot give market reports up to the date of the paper.

ANS.—We give market reports up to the very hour of going to press. Your mistake is in comparing the *date* of market reports with date of paper. The RURAL is dated *ahead* nearly a week.

J. B., McLean Co., Ill., asks where can he obtain seed of the Chester County Mammoth and Blount's White Prolific Corn.

ANS.—Inasmuch as many of our advertising patrons have both kinds to sell, we do not think it would be quite fair for us to particularize.

A. G. Vaughan, Chester Co., Pa., inquires where he can get the best strain of Plymouth Rocks.

ANS.—We have had several strains at the Rural Grounds, and like Mr. C. S. Cooper's as well as any. His advertisement appears last in this column.

A. L. Long, Florida, says he has written to E. & O. Ward, who advertise in the RURAL, for one of their circulars, but has received no reply. Do they handle fruits and vegetables?

ANS.—Yes. The above note was forwarded to the Messrs. Ward, who reply that the application was not received by them.

G. S. N., Middlebury, Pa., asks whether the Hoosier Grain Drill, made in Richmond, Ind., will plant pumpkin seed with the corn.

ANS.—Yes, it will plant pumpkin seeds with the corn as well as corn alone, though the pumpkin seeds would not be dropped with as much regularity.

S. B. P., Berlin, Pa., asks whether a silo must be built frost-proof.

ANS.—It is only necessary that air should be excluded.

H. C., Peterboro, Ont., asks where thereabouts the common White-flowering Horse-chestnut can be had, and at what price.

ANS.—About 50 cents each. Please consult advertising columns for nurserymen.

J. E. D. B., Waverly, N. Y., asks where he can get seed of the Waushakum Corn, referred to in the RURAL Corn Special.

ANS.—From E. L. Sturtevant, South Framingham, Mass.

G. W., Auburn, N. Y., asks where would he be likely to get seeds of the Geranium sanguineum which was included in our Free Seed Distribution a year ago.

ANS.—Try Woolson & Co., Passaic, N. J.

W. H., Ionia, Mich., asks how to make movable racks for barnyard stock.

ANS.—We have in preparation an illustrated article on racks and other feeding conveniences, which we hope to publish shortly.

W. M., Penn Yan, N. Y., asks where can the Japan Snowball be got.

ANS.—Send for catalogue of the Kissena Nurseries, Flushing, L. I., or Ellwanger & Barry, Rochester, N. Y.

Many questions are asked as to where certain hardy trees and shrubs can be purchased.

ANS.—We reply—Send for catalogues announced in our columns.

I. P., North Blenheim, N. Y., sends a package of Spring wheat for name.

ANS.—We cannot name the variety, having had very little experience with Spring wheats.

T. J. L., Lowville, N. Y., asks where can he get the Buist Hardy Passion-vine.

ANS.—Write to Robert Buist, Jr., 922 Market Street, Philadelphia. He may know—we do not.

G. S. S., Snyder Co., Pa.—We have never tried pumpkin seeds in the corn drill alluded to. But we do not see why the machine would not drop them.

B. Steiner and at least fifty others inquire as to the hay sling mentioned by Professor Roberts in his late article. An answer is made by him elsewhere in this issue.

R. B. W., Mountain View, Ont. Can., asks where can he procure seed corn suitable for that latitude.

ANS.—Of William Rennie, Toronto, Canada.

W. S. S., Niagara, Ont., asks whether the Chester County Mammoth Corn ripens so far north.

ANS.—We should say it would not ripen there.

Stock and Poultry.

POWELL BRO'S,

Springboro, Crawford County, Pa.

THE MOST EXTENSIVE IMPORTERS OF

CLYDESDALES

IN AMERICA.

One importation for 1881 already received, and another on the way, and another ready to leave Scotland, and others still to follow,

BOWKER'S

HILL AND DRILL

PHOSPHATE

SEND FOR PAMPHLET.

This is a true bone superphosphate, and may be used *on any crop*, in the hill or drill or broadcast, either *with* or *without* manure, and will produce a much earlier and larger crop. In the Report of the Mass. Inspector of Fertilizers, its valuation is from $3 to $10 per ton higher than other Phosphates which sell at the same price. The past year over 3000 tons were sold against 100 tons three years ago, showing that it is liked by the farmers. If there is no local agent near you, send to us.

Also for sale STOCKBRIDGE MANURES.

BENSON, MAULE & CO. 223 Church Street, Philadelphia, Pa.

PURE SUGAR CANE SEED

The undersigned keeps a supply of Early Amber and Early Orange cane seed, the product of different latitudes; hence adapted to various climates. The Orange is especially recommended for sugar making and for districts subject to hot sun in July and August. It has received the indorsement of the Mississippi Valley Cane Growers' Association at its late meeting.

Prices of seed at St. Louis: Early Amber, by mail, 3 pounds, $1; by express or freight per pound, 15c.; large lots, 10c. Usual discounts to the trade.

Early Orange, by mail, 2½ pounds, $1: by express or freight, per pound 20c.; large lots, 15c.

Kansas Orange, for northern culture, prices same as Early Orange.

No orders filled for less than $1. Remit by draft money order or registered letter.

Caution must be taken in selecting Orange seed, as when cleaned, none but an expert can detect it from some other variety, and the desire to speculate may induce some to mislead by selling other seed as Orange. It was for this reason that I had placed this seed in reliable hands last season for cultivation, in order to secure reliably pure seed for my trade.

For Women.

CONDUCTED BY MISS RAY CLARK.

HER SYSTEM.

EDGERTON.

THERE lived, in days not very long gone by—
I could not tell you where, if I should try—
A lady, who was worthy, kind and good,
And all domestic arts well understood;
Her cooking, always tempting to the taste,
She took great pride in doing, free from waste;
She'd set a dinner fit for any king,
From ham and eggs, or some such simple thing;
She had a way, peculiarly her own,
Of always doing well whate'er she done;
She took great pride in always being neat,
As well as spreading toothsome viands to eat.
Her fav'rite hobby, all through life, had been
To keep her house as shining as a pin.
"A very model," she at length was termed,
And all her ways were patterned, taught and learned—
"A place for everything," she'd say with grace,
"And everything exactly in its place."

But all in vain her systematic plan,
Since she was wedded to a careless man;
He'd tell his wife, with blandly smiling face,
That *he* for everything had special place,
The only trouble being, that he forgot,
And ne'er again could recollect the spot.
He'd scatter helter-skelter, here and there,
And leave his traps a lying everywhere.

At length she hit upon a happy plan
By which she thought to cure a careless man;
She kept a bag of most capacious size,
Hung in a certain spot, hid from his eyes,
And in it dropped his little odds and ends,
As he would toss them to the careless winds,
And thought, forsooth, at some convenient time,
She'd empty out, and shame him of his crime.
But he, more cunning than she'd ever thought,
Had watched the woman well, till he found out
Where she, as stealthily as any cat
Had carried off and hidden, this or that.
"Aha!" said he, "this system suits me well,
I'll not be bothered any more to tell
Where anything may be I chance to quest,
For here, I find my lady's hidden nest!"

And any article he chanced to lack,
He'd go and gobble it from out the sack.
The upshot of her system, we are told,
Was, *being left with just the bag to hold.*

[This is how Mary Wager-Fisher's plan worked at our house.]

DESCRIPTION OF CUTS.

FIG. 166.—DRESS FOR LITTLE GIRL FROM FOUR TO SIX YEARS OF AGE.

The dress is of dark-green plaid, with hood lining, cuffs and sash, of red satin.

FIGURE 167, Key to figures. 1, black and white check. 2, salmon. 3, green check. 4, satin—pink and white stripe. 5, dark brown. 6, lavender and white. 7, black. 8, light green. 9, sky-blue, my mother's wedding frock. 10, cherry. 11, silver. 12, green and black check. 13, bottle-green. 14, black velvet. 15, scarlet velvet. 16, navy-blue. 17, striped gray. 18, violet satin. 19, black and white check. 20, brocaded white ribbon. 21, plum. 22, gray.

FIG. 169.—MUFF WITH SAC.

This muff is of black embossed velvet, with pointed drape of velvet, embroidered with silk or beads and edged with fringe; the sac is of black satin, trimmed with deep black lace.

FIG. 170.—BORDER: CROSS-STITCH AND DRAWN THREADS.

This border is suitable to be worked on crash, art canvas, or coarse linen. The cross-stitch is worked with colored Andalusian wool. The method of working over the drawn threads is clearly shown in the illustration.

FIG. 171.—BORDER: CROSS-STITCH.

This border is worked in cross-stitch with colored cotton or marking filoselle. A few back stitches are also employed. It is suitable to be worked round doilys, table-covers, servlettes, etc.

FIG. 172.—EVENING-CAP AND COLLAR.

The cap is composed of Breton lace, ornamented with a bouquet of flowers, and fastened at the back with a bow of ribbon. Collar of fine checked muslin, embroidered with crimson and blue silk, and edged with lace.

FIG. 173.—CRAVAT.

The cravat is of old-gold satin, edged with two rows of black lace, embroidered with gold; it is gathered at the back and front of throat, and is fastened under a bow of narrow ribbon.

FIG. 174.—BORDER EMBROIDERY.

This border is suitable to be worked over a joining of two materials; a braid is placed exactly over the join; the long and knot stitches on each side may either be worked in silk or wool.

CONCERNING PIANOS AND GIRLS.

MARY WAGER-FISHER.

I HAVE a great deal of sympathy with the young woman who, when asked if she played the piano, replied: "No, Heaven be thanked!" and I wish that there were a great many more who felt in a like way, for the piano has really become a national grievance, and the harm it has done intellectually, socially and esthetically is incalculable. Now that piano playing has become so common that people are satiated with it, and are turning to other occupations and accomplishments for their daughters, it is to be hoped that the *greatest* accomplishment possible to a woman will receive the attention it deserves. I refer to the art of talking well.

I suppose it would not be an exaggeration to say that not one-twentieth of all the women and girls in the country who own a piano, or are "dying" to possess one, can be credited with speaking the English language beautifully, so that it is a delight to listen to them.

In order to be a beautiful talker, one must possess a cultivated voice, a well stored mind, produced either by reading, travel, or observation, and the ability to express one's self fluently and elegantly.

Any woman who can do this, has the accomplishment *par excellence* of all accomplishments.

FIG. 166.

She can amuse, interest, entertain, and also instruct those about her, with a delight that is infinite in its range.

Society never wearies of her—she is the center of attraction; she possesses the charm which never grows old nor stale. Moreover, her great possession is in and of herself, and her delight in being able to express her thoughts and feelings in a fitting way, is very great.

Beauty, art and science have their fascination, but none of them equal that of a beautiful talker who has music in her voice, grace in manner and gesture, and eloquence in expression.

When Washington sat to Gilbert Stuart for the famous Stuart portrait, he had Miss Chew of Germantown, often accompany him, as her conversation, he said, brought out his best expression.

The fame of Madame de Stael's wonderful conversation will in all probability outlive the fame of the best pianist that ever lived.

Next to being a beautiful talker, I place the gift of beautiful singing. The two are very nearly allied in the effect produced upon others, and have much in common as an accomplishment which gratifies the possessor of it. There is a charm in a charming voice falling from the lips of a woman especially, that is beyond all measure, when the words she speaks are truly mated to the voice that utters them. But the piano—the dreadful piano, and the still more dreadful thrumming—the money wasted—the time wasted—the misdirected abilities—the back aches and the head aches, and I might well add the ear aches, that are the outcome every year of the piano and the music lesson! Is there not something better girls for the than all that?

I imagine I am as fond of instrumental music as most people, and I had my day at piano thrumming; but it was a comparatively short one.

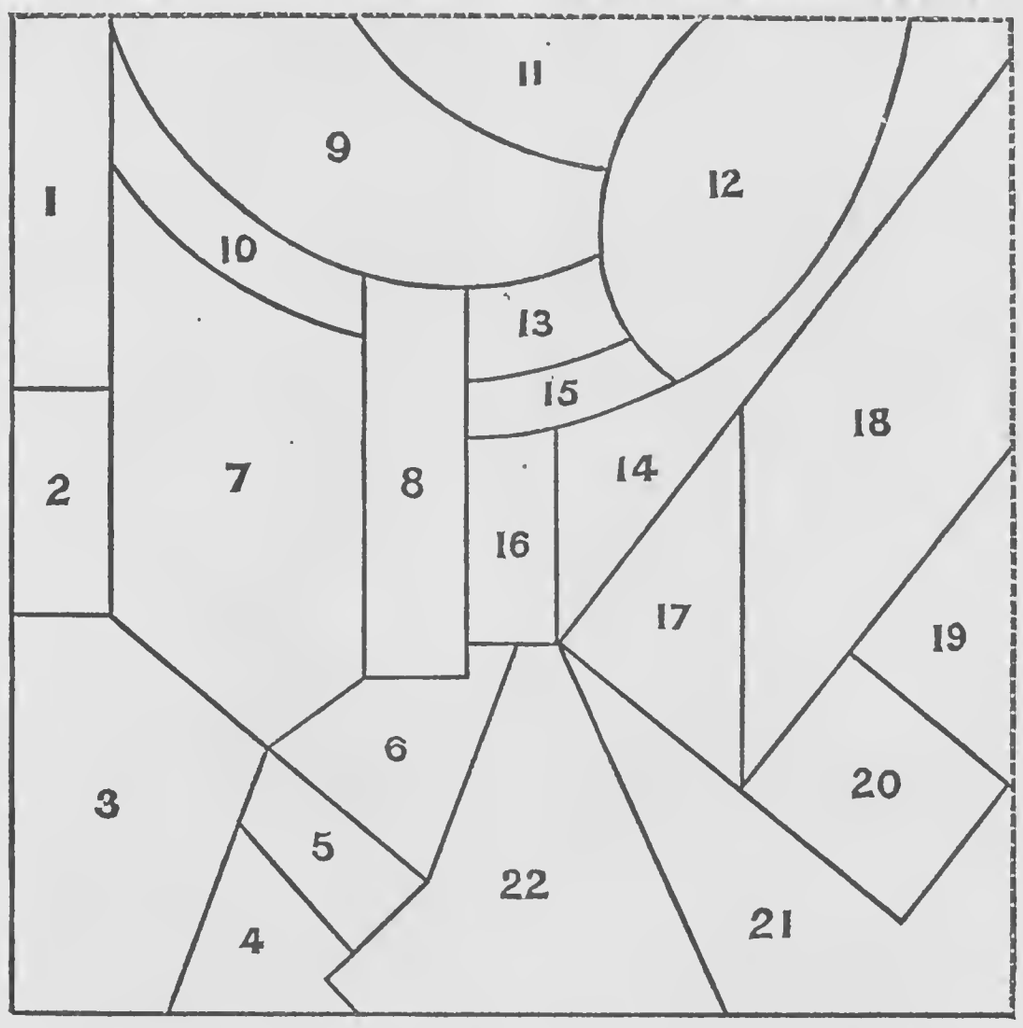

FIG. 167.

heard the usual praises that music teachers indulge in regarding my talent for music, I sang a little; that is I made a noise of varied sounds. But I very quickly perceived that with all the musical advantages possible, I should never be anything better than a fifth or sixth rate player to say nothing of singing, and I wisely concluded it was not worth the trouble.

And what of the thousands of young girls, who from the age of six to sixteen are placed at the piano and are absolutely forced to practice from one to four hours a day, whose girlhood is consumed in an almost profitless task, unless it may be satisfying the vanity of foolish an short-sighted parents. Is it not most pitiful?

The sound of singing and of music is delightful in a home, and serves a noble purpose, but only when it is a natural and an agreeable expression of feeling. A girl who goes singing through the house like a bird, pouring out a flood of gay and bright song, is like a rose in mid-winter; but the girl who is asked to play, who waits to be urged a little, and who goes through her score mechanically, or precisely as some one has taught her, who can make a great deal of noise and bob her hands about on the keyboard in a way that her rustic auditors think "perfectly splendid." Nothing, to the ear of an intelligent lover of music can be more dismal, and nothing, perhaps, to the soul of the girl less enjoyable. Poor thing, I say! Had it not been for the Juggernaut piano, she might have learned to draw beautifully—an exquisite accomplishment—to have learned to talk well, or perhaps to spell and write well, or to have cultivated flowers to such an extent both indoors and out-of-doors as to have delighted the eyes and noses too, of hundreds of people, and had the keenest sort of happiness, herself.

To young people who have an irrepressible taste for musical study, there is but one bit of advice—to go ahead.

People who have a decided bent for any thing, know by the best sort of knowledge, what they should do.

It is for the average girl for whom I plead; the girl who has no special talent for music, but spends her youth at the piano, because she, or her friends think it is fashionable, or "nice," or because some other girl is learning to play, who will be as sorry a failure as herself, and who might, if the same amount of money were expended in her behalf, as the piano and all its belongings cost, be developed into a really fine, useful and accomplished woman.

Neither do I think, because the piano has already been bought, that the girl must learn to play on it, when it is evident that to make her

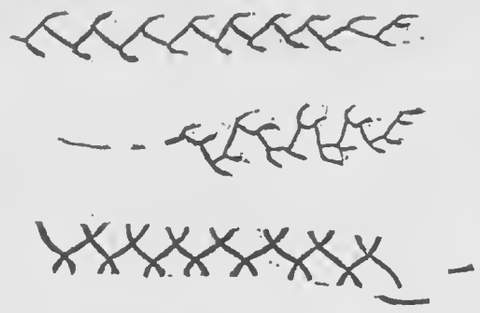

FIG. 168.

"practice" is distasteful and irksome. It is like eating an unwholesome dish of food for the sake of "saving" it.

To girls who are waiting, hoping, longing and planning for a piano, I want to say "DON'T." Think about it all around. Think of the room it will take up in the house and—in your time! Think of the money it will cost. Think what a heavy thing it is to move about. Think how carefully it must be cared for. Think how, of all accomplishments it is the most common. Think of the never ceasing practice, of the constant outlay of money it will entail, then think of other things that might serve you and yours vastly better.

Perhaps it may not be amiss to tell you that if you wish to study music for the sake of being fashionable, that it is quite the fashion now for misses and young ladies to learn to play the violin, the flute, the oboe, the harp, the clarinet, the bassoon, the kettle drum.

Of wind instruments, Mr. Sidney Lanier, who is an authority on the subject, says:—"No one at all acquainted with this subject will undervalue the benefits to female health to be brought about by the systematic use of wind instruments. Out of personal knowledge, the writer pleases himself often with picturing how many consumptive chests, dismal shoulders and melancholy spines would disappear; how many rosy cheeks would blossom; how many erect forms would delight the eyes which mourn over their drooping—under the stimulus of those long, equable and generous inspirations and respirations which the execution of every moderately difficult piece on a wind instrument requires."

Where there is a family of several girls, or of boys and girls, very delightful little orchestras can be formed, by each one learning to play upon a different instrument (always leaving out the piano!).

There is no instrument of the orchestra, excepting, perhaps, the heavier bass, which a woman cannot play successfully, and upon some of these instruments Mr. Lanier thinks that women, because of their superior daintiness, would make

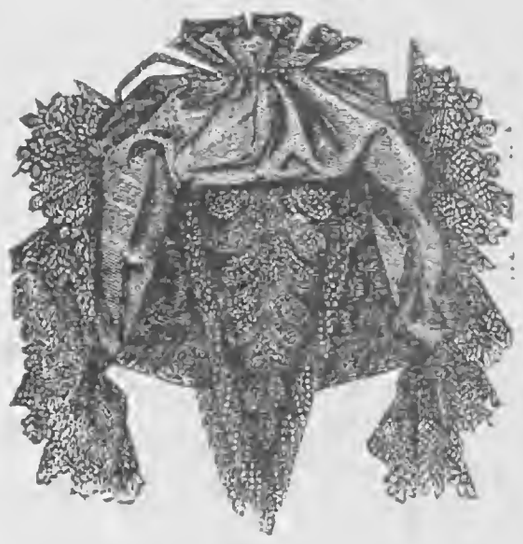

FIG. 169.

more successful players than men. This is especially so in playing the flute, and, one might also reasonably suppose, in playing the violin. So if any member of the family must play the piano, let it be one of the boys, who has no desire to increase the size of his chest. But if you have the gift of song—a singing voice—learn to sing as beautifully as possible. A beautiful singer is worth a thousand pianists, and a beautiful talker is still better. Remember that; and remember, too, that however lacking in money or advantages you may be, that you can do much yourself towards making of yourself a fine talker.

MRS. GARFIELD.

LUCRETIA GARFIELD—now mistress of the Executive mansion, is the daughter of an Ohio farmer. The public is not informed that she spent her girlhood in reading trashy novels, in curling her hair or in hemming ruffles for her petticoats. But it is informed that she learned latin, and learned it so thoroughly that years after she prepared her sons (in latin) for college.

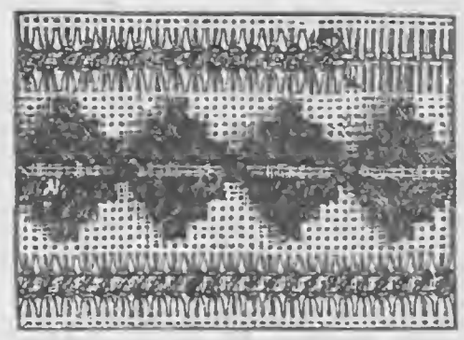

FIG. 170.

Although a thorough going housekeeper, the mother of quite a family of children, and always obliged to economize (for the Garfield's are not rich) she has kept her mind bright with reading and study, and herself an intelligent companion for her husband. It is worth while for our young farmerines to consider the possibilities that lie in their own future, and to ask themselves if they are spending the golden hours of their youth in such a way as will best fit them for positions of eminence and usefulness.

MARY WAGER-FISHER.

AN impertinent busybody importuned a young lady with the question, "What shall I say to people who ask me if you are going to be married?" "Say the truth," the girl promptly replied. "Yes, and what is truth?" continued the questioner, eagerly. "That you know nothing about it," was the conclusive reply.

CORRESPONDENT'S CORNER.

I SEND an illustration of one of my silk patchwork blocks, desired by "A New Subscriber." Of course no two blocks are alike. The block, as shown in Fig. 167, is thirteen inches square, and the key to the figures will indicates the color of the silks used. If "New Subscriber" actually begins a quilt, she will finish it in a short time, as it is very fascinating employment. M. W.-F.

DEAR MISS RAY:

Please excuse me for not sending the cat-stitch sooner, but I have been quite busy since I received the RURAL.

I think I worked my sister's sacque in coral-stitch, but the others I saw were worked in cat-stitch.

I should have said that the narrow striped bed-ticking is the prettiest foundation for a sacque.

The cat-stitch is the one represented at the bottom of Fig 168, and is the one usually used to lay open seams in flannel. It must be worked from you to get it right.

The stitch at the top is coral, or feather (I think coral is the more correct name). This must be worked towards you. The center one is double-coral, or double-feather stitch, but it is not suitable for working bed-ticking.

I shall try to tell you before long how to make lovely rugs, something, I think, entirely new to many of the RURAL sisters. MRS. W. V. A.

Mrs. R. S. will please notice this answer to her inquiry. Also please send address to RURAL'S office. R. C.

Literary Miscellany.

GO SLOW.

When you a pair of bright eyes meet,
That makes your heart in rapture beat;
When one voice seems to you more sweet
Than any other voice you know,
Go slow, my friend, go slow;
For brightest eyes have oft betrayed,
And sweetest voice of youth and maid
The very falsest thing have said,
And thereby wrought a deal of woe;
Go slow, my friend, go slow.

When you're convinced you are a poet,
And wishing all the world to know it,
Call on some editor to show it.
Your verses full of glow and blow,
Go slow, my friend, go slow;
For many a one has done the same,
And thought to grasp the hand of Fame,
And yet has never seen his name
In print. And why, waste baskets know:
Go slow, my friend, go slow.

When you to greed for money yield,
And long the mighty pow'r to wield
That's always found in golden field,
With senseless pomp and pride and show,
Go slow, my friend, go slow.
For thousands, tempted by the glare
Of wealth, have fallen in the snare
Set for the thief. And now despair,
Regret and shame have brought them low;
Go slow, my friend, go slow.

The good old Earth is never wrong:
Each of her works takes just so long;
Months pass before a happy throng
Of daisies in the meadows grow:
Go slow, my friend, go slow.
And Spring gives life to Summer's flow'rs,
And Summer's sun and Summer's show'rs
Prepare the fruit for Autumn bow'rs.
And Autumn frost brings Winter snow—
Go slow, my friend, go slow.

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

(Continued from page 178

CHAPTER VII.

RIDING IN THE PHILLEGOMOTER.

After rambling along for about half an hour I came to a cross street just as one of the long-distance phillegomoters descended to the pavement. A sudden impulse prompted me to take a ride in it, so I stepped aboard along with the little group who were waiting. Curious to observe every operation of this wonderful machine, I stood looking intently out of the window in the door as the car rose to the level of the track. I heard a voice say "Sit down!" but before I could obey the command I realized its importance: for the suddenness with which the car started off caused me to measure my length on the floor. One gentleman kindly interposed an arm, which somewhat broke my fall, and he, with two others, assisted me to my feet. Red with confusion, I stood shaking the dust from my clothing, when again a voice cried out, "Sit down!" A feeling as if my feet were disposed to stand still while the rest of my body was inclined to move forward would have ended in another fall had not a gentleman caught me in his arm and forced me into a seat.

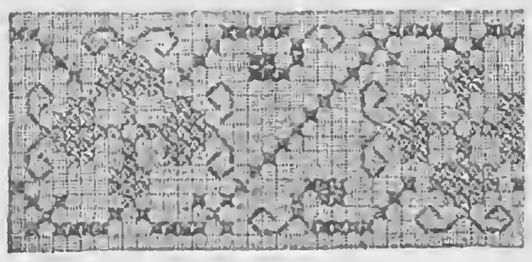

FIG. 171.

My mortification was so great that I believe I would have rushed out of the car had I realized that a station had been reached, but before my confused mind was able to take in the situation the car had descended to the sidewalk, taken on several passengers, and was rising again to its track.

I expected to see a smile on every countenance as one result of my mishap, but I was surprised to observe that not one of my fellow passengers showed the slightest disposition to laugh. On the contrary, there was an anxious look on every countenance, which seemed to at once disappear when, in answer to many kind inquiries, I replied that I was wholly uninjured. I could not but observe, however, that I was regarded by many with a look of pity; and when the gentleman next me asked kindly after my general health, all my fellow passengers seemed to stretch their ears to catch the reply, with so much solicitude that it was clearly apparent that they regarded me as a poor, unfortunate invalid, whose system could ill bear the jar of the fall which I had received. I was conscious of the fact that my physical appearance was far below that robust health which was a prominent characteristic of the people about me, but I never considered myself a person of weakly constitution. It is true that I suffered occasionally from headache and indigestion, and now and then a bilious attack obliged me to summon a physician; but these I regarded as the common, unavoidable ills of life, and I considered myself exceedingly fortunate, and that it was an evidence of the integrity of my constitution that I was never brought down to a languishing bed of sickness.

On five different occasions during my brief stay in the city inquiries had been made after my health, with a kindly solicitude which led me to fear that these keen-eyed people discovered something in my appearance which was really alarming, and I began to feel that it would be a matter of prudence to consult a physician. So I asked the gentleman next me if he could tell me where one might be found.

"Physician!" he repeated, with a look which seemed to imply that the word conveyed no idea to his mind.

"A doctor—one who heals the sick," I explained.

"Oh, yes, I understand you now," he replied. "But really, sir, I believe there are only two or three persons in the city who are ever called upon for advice in cases of physical debility. But never having had occasion to consult one, I cannot tell you where any of them may be found."

FIG. 172.

He then turned to an old gentleman who sat a couple of seats beyond him, and repeated my inquiry to him. He was an old man of a hundred and twenty-five or thirty years, judging from his appearance as compared with that of the old men whose ages I had learned. But even he was unable to tell where a healer of the sick might be found. "There is, however," said he, "a friend of mine, a very learned man, who has made ancient medicine a study, who, I think, would be able to give you some useful advice. His name is Autleman, and he lives on Ninety-second avenue between Two Hundred and Twenty-first and second st."

I remarked that I was an entire stranger in the city and requested him to give me the necessary directions to find the locality. The gentleman whom I first addressed at once offered himself as my conductor; for he said that I, being unused to their rapid mode of traveling, would be likely to be carried beyond my reckoning and thus occasion delay, while he would be able to conduct me by the quickest and most direct route. "And despatch," added he "is all important."

"Is the distance far?" I asked, with some anxiety.

"Between eleven and twelve miles," he replied. "But it is only a matter of about as many minutes, if we make prompt connections," he added, discerning the look of anxious surprise in my face.

I was beginning to feel that we could not get there any too soon. In fact a deathly sickness seemed to be stealing over me. Ninety-second avenue was away at the other side of the city, and Two Hundred and Twenty-first street was in a direction directly opposite to that in which we were going. So it was necessary for us to get out at the next station, cross the city to Ninety-second avenue and then go back to Two Hundred and Twenty-first. We had to use both the long and short distance lines, and four changes of cars were necessary. But we made the trip without any delay worth mentioning, and with a celerity of movement which would certainly have been fruitful of mishaps to me had I not been under the guidance of one naturally well endowed with vigor and quickness of thought and motion. It was a down, up and then advancing movement, during which one had barely time to get well settled in his seat before a mile station had been reached. And here I may observe that the seats, which were ranged along both sides of the car, were each a separate compartment whose projecting sides were well padded, so as to give suitable rests to the bodies of the passengers against the sudden movements of the motor.

It required some experience, I found to ride successfully in one of these cars. Promptness in getting up as soon as it touched the pavement, or getting on while those leaving it were getting off, and taking a seat before it had again reached the level of the track was essential to safety and dispatch in riding on the phillegomoter.

We reached Dr.—or rather Mr. Autleman's;—for there are none who follow medicine as a profession in this country—in just eleven minutes from the moment our purpose was taken. I almost forgot to say that I was at no expense for the long ride which I had taken. The different lines or phillegomoters being all owned by the city, the cost of running them, which was surprisingly low, was laid as a tax on the people so that they were free to all.

Mr. Autleman was not in, and an hour or more passed before he arrived. The gentleman who had performed such a kindly service for me, left me because of engagements which would not permit of further delay.

I cannot describe my state of mind during the time that I waited for relief from my sudden and unaccountable sickness. Men have died with much less pain than I experienced but few ever suffered greater mental disquietude in view of probable death. The good lady of the house, to whom I made known my story, showed the kindliest interest in me, and spoke of my condition in a tone of encouragement. But she could not disguise from my watchful eye the look of concern which appeared in her most sympathetic countenance. She repeatedly assured me that her husband would soon be home, and, unknown to me, sent a messenger to hasten his return, and she was so successful in keeping my mind occupied with pleasant conversation that I verily believe she was instrumental in preventing me from falling a victim to my morbid imagination.

At last the master of the house returned. He was a middle-aged man as the expression is understood in this country, say seventy-five or eighty years of age, and by far the finest specimen of an intellectual man that I had yet seen among this most noble people. His grand forehead, projecting far over his face, and rising broad, full, and high, spoke of a store-house for knowledge of unlimited capacity, and a reasoning power capable of resolving the most hidden secrets of nature. While his penetrating eye, gleaming from under his shaggy eyebrow indicated a critical acumen which searched to the very last analyses every subject which engaged his powerful mind. In other respects his face indicated great power combined with much delicacy, and though an expression of benevolence was not wanting, it seemed to be kept in obeyance by the commanding energy which was expressed in every lineament.

With many apologies for presuming to trespass on his time and attention, I made known the object of my visit, and by whom it had been recommended. Taking a seat beside me with a very deliberate air, he asked me to give him something of my history. I thought it strange that he should make such a request of a person in my condition, and gently suggested that he might, perhaps, first give me a cordial or tonic of some sort to relieve my distress.

"You need no cordial," he replied, in a most decided and emphatic manner, which was both silencing and reassuring.

From the questions which he asked as I proceeded with the account of my life, I observed that he was particularly interested in knowing about my parentage, my occupation and habits of life.

During the progress of my narrative, his eyes were bent upon me with the all-searching gaze of a seer, and what I told him seemed to be but little more than a confirmation of the story which his keen eyes read in my face and physique.

"There is no occasion for you to feel any anxiety over your present condition," said he, when I had finished my account of myself. "If you live among us and adopt our habits, you may reasonably expect a life prolonged to seventy-five or eighty years. But if you continue in your old habits, this period will be shortened at least twenty-five years.

"You have been unfortunate in your parentage, having inherited a physical constitution in which there are many points of weakness. You have been unfortunate in your education, in not having been thoroughly instructed in the laws which govern your various bodily functions, and trained to obey them. You have been unfortunate in your occupation and habits of life, inasmuch as that they have not been founded upon those inimitable laws of the physical constitution, the obedience of which is health and the enjoyment of life, but whose disobedience is disease and death.

"Every individual who is born into the world receives from his parents a heritage of constitutional vigor which is like so much capital in a bank. If it be rightly managed for him in infancy, and if he be instructed and trained to use it wisely when he himself gains control of it, it will be a continual advantage and enjoyment to him throughout a life which it will greatly prolong. But through ignorance, negligence or wilfulness it may be squandered, and the individual may find himself a bankrupt in all that makes life enjoyable before one-quarter of his years are told.

FIG. 173.

"Now your inheritance, not very large in the beginning, has been used with neither prudence nor intelligence; hence to our people, among whom health is regarded as the very foundation of happiness in the present world, you appear puny and feeble at a period of life when your physical vigor should be at its very acme.

"The only advice which you need is this: Observe the habits of the people about you, and cordially adopt them. And although you will never attain a large measure of physical vigor, you will yet be able to pass many years free from any portion of the terror which has driven you to consult me to-day."

He rose as he finished speaking, which I construed in a desire on his part that the interview might end. It is needless to say that I felt immediate relief, and, at the same time a strong suspicion came over me that my ill-feeling was surely imaginary. At all events I placed implicit confidence in the words of my adviser, for never yet had I met a person whose presence inspired me with so much respect for his wisdom and integrity. I took my departure with many thanks and apologies, which were cut short by a look from him the meaning of which could not mistake.

To be continued.

WHAT WILL HAPPEN TO YOU IF YOU LIVE TO BE OLD.

You will at first be surprised to hear yourself called an old man, or "the old gentleman" This you will soon begin to consider as a token of respect, but when, by way of insult, you are called "old dad" by insolent boys, you will long to see the bear coming out of the woods.

No, I am not an old man, will be your unspoken thoughts. I can walk, run and jump, which latter an old man cannot do. I have good appetite, good eyesight, good digestion, hear well, sleep well and enjoy life. True, there are some gray hairs and some wrinkles, but what of that? Others have the same that have never indulged the thought of being old. Why, there is my neighbor, he is nearly ten years older than I, he is engaged in active business with full as much anxiety and industry as his sons. True, he wears spectacles, so do many younger men or even myself, but that is simply an infirmity of slight account. And so you will argue from year to year, trying to convince yourself that you are not an old man, not even failing; not much, not much.

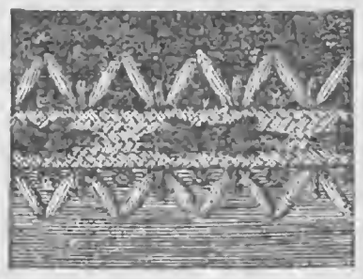

FIG. 174.

But at last you will be compelled to acknowledge that your joints are a little too stiff, that you get weary with a little extra exertion, and finally, that you get very tired. You hold your book at an inconvenient distance, your newspaper is blurred and you conclude to submit to wearing spectacles, at first the fashionable *pince nez*, but eventually this is not so convenient and as you have made up your mind to agree with your friends that you *are* in reality an old man, you adopt the old fashioned bow spectacles.

Time goes on, weariness increases, spectacles must be changed, partial baldness comes, hearing is capricious, not really deafness but an inability to distinguish between the words spoken to you; your hair has lost its gray and put on the white, your hands are a bunch of wrinkles and veins, your face has lost its color and your flesh is shrunken, and weight diminishes. You fall and are hardly able to rise, the slight moisture naturally exuding from the skin has nearly dried up, and for the want of the friction that it should afford, things drop from your hands despite your clutch. You incline forward either in standing, walking or sitting, you try to counteract this attitude of decrepitude and to stand erect, but the cartilages that have held the joints in proper shape have shrunken on one side from unnatural pressure and will not let you up.

Ambition fails, memory is treacherous, the tongue does not obey volition, and you fall over the least obstruction, and finally you are ready to say with the immortal poet, "sans teeth, sans eyes, sans taste, sans everything." VIELAND.

A DISTINGUISHED SUCCESS.

Some acute observer has framed a proverb that an army of sheep led by a lion is better than an army of lions led by a sheep. Exaggeration though this is, it is an expression of the proved truth that no matter how good the materials and sound the principles of any enterprise, the essential thing to success is that the management be good. Nothing is simpler than the rules of getting rich: one has only to buy cheap and sell dear. The thing is stated in less than ten words, but not one in a thousand men is able to do this simple thing. Nothing can be simpler than the business of banks, and because banking does not legitimately include ordinary business risks, the expression, "as safe as a bank," arose; yet the wrecks of banks are strown all along. Nothing can be simpler than the foundation principles of mining life; there is no "if" in them, no probability.

Life insurance is the only business in the world, if rightly managed. But this little "if" means everything; and when companies fail the real lesson is, not that the system is discredited, but that there has been weakness in the practice. How shall the companies where there is no weakness be distinguished from the rest? Time has already supplied the test. In the New York Life, which has now issued its thirty-sixth annual report, time has especially set the seal of approval. This company has seen the country grow, the railroad system develop, the telegraph come into general use, the cable connect the nations; it has passed through two wars and two financial crises; and it has grown large and strong as it has grown old. Starting without capital stock and without funds, it has accumulated forty-three millions of unquestionable assets, and has now outstanding one hundred and thirty-five millions in insurance. It is as solid and as trustworthy as any thing of human construction can be. It has done a great work of usefulness already, and is now better prepared than ever before to continue this work. Always

in the front rank in point of security, progressiveness, equity and economy, it presents unsurpassed claims to the consideration of intending insurers.

THE expression "A 1," popularly used to designate the first quality of articles, is copied from the symbols of the British and foreign shipping-list of the Lloyds. "A" is used to designate the character or conditions of the hull of a vessel, and the figure "1" to denote the efficient state of her anchors, cables, and stores. If those are insufficient in quantity or quality, the figure "2" is used to indicate the same. When it is said of a ship, "she is A 1," it means that she is all right as to hull, rigging, and equipments.

Hop Bitters give good digestion, active liver good circulation and buoyant spirits.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING THE INETRFERENCE OF THE FATHER-IN-LAW AND THE MOTHER-IN-LAW IN DOMESTIC AFFAIRS.

MARY WAGER-FISHER.

ANAXIMANDER came home from his office a night or two ago, and as we were at dinner he remarked: "I think that a good many people are made unhappy by the interference or peculiarities of their relatives in their domestic affairs. A client of mine who was in the office to-day, was telling me of the trouble she had in her family. She has her own mother with her and her father-in-law, and I imagine that she has as much annoyance from the one as from the other, etc., etc.," an extension of conversation that need not be repeated here, but which further illustrates the matter in hand.

A great deal of anathema has been hurled in the newspapers at the "mother-in-law," but such expressions have come chiefly from men who for well or ill founded reasons have come to regard that relative as altogether a superfluous personage in their own households. But I find that women, as a rule, have more trouble from the father-in-law, who, if he be given to meddling with household affairs, is a nuisance of the first water. I wish to say, before proceeding further, that some of the sweetest and most delightful members of families are sometimes the father or mother-in-law, and no word of praise can be too high for them. But there is another class equally well-meaning may be, but who succeed in making the younger households, of which they may be permanent or occasional members, extremely unhappy from their habits of meddling with what—I put it in plain terms—is none of their business. And I am going to point out some of the things which parents-in-law do, which they ought not to do, and ought to do.

I'll begin with the father-in-law. He will please to keep out of the kitchen just as much as he possibly can. He will not poke his nose into closets or cupboards, parley with the domestics, investigate the condition of the swill barrel, the ash barrel, the coal bin, worry himself about the kerosene or gas bills, or make purchases of provisions for the family under the pretence that he can buy more cheaply than the mistress of the house; let him do none of these things unless especially commissioned so to do by the mistress of the house. If he thinks that the daughter-in-law or son-in-law is wasteful, improvident or a bad manager, the best thing for him to do, decidedly, is to keep his thoughts to himself, for in all probability things are better managed and better taken care of by the second generation than they were by the first. And *even if they are not*, it is far better to pass the matter over in silence than to comment upon the same, and thereby engender bad feelings. When advice is asked, give it to the best of your judgment, but don't proffer it *too freely* unasked.

Do the father and mother live who think that their children, when they marry, are quite as competent to manage a household as they themselves were before them when they married? I opine not. But it does not follow that they are not, none the less. At all events, they like to do as they please and not be made to feel that they are still in leading-strings.

I think one great failing of the mother-in-law is a proneness to criticise "John." True, John may not be a piece of perfection; if he had been he would not have married her daughter. The mother-in-law is as prone to tell her daughter how she ought to manage John, and she is apt to complain to John about what a hard time her daughter has. Then, too, the mother-in-law is given, more than the father-in-law, to criticising the habits of the children and how "shockingly they behave." I think when parents presume to speak disrespectfully of the husband or wife of their child, to the child, that the duty of the latter is to disable their own guns at once with a well-directed shot. Such comments are altogether out of place and should never be allowed. Another fault of the father and mother-in-law—and it is one that the younger folks are not free from—is their tendency to a "penny wise and pound foolish" policy, fretting over trifles and occupying themselves so much with trivial matters as quite to overlook matters of real importance. To be able to save and apply one's best energies, time, opportunity and money to the *important* things, and let the unimportant things "go," is genius—the greatest gift with which one can be endowed. A fretful, peevish, hypersensitive parent-in-law in a household, is as a thorn in the flesh. The older a person grows, the more amiable and less irritable he ought to become. By the time a man is seventy he should know how silly and useless it is to fret, how many and great the trials of life are, and do all he can to smooth the pathway of the younger feet about him.

Nobody likes a visitor who comments upon the way the house is managed—unless the words are commendatory—or who invades the kitchen, or asks why you don't have things so-and so. And what is true in regard to a visitor is equally true in regard to a parent. He should remember that he is not in his own home, if the reins of government and of management have been intrusted to other hands. He should no more venture to meddle with the affairs of the household than he would if he were a guest in the house of a friend, or a boarder in a hotel. And the same applies to the mother-in-law and to one and all other relatives dwelling in the household, who are not authorized to act in such capacity by a mandate from head-quarters.

Finally, if parents live with their children, ought they not in all reason to conform so far as possible to the customs that prevail in the house? And when the children live with their parents, they ought, in all conscience, to conform to the customs of the parents. In either case, it is impertinence to meddle with servants, or to comment upon the "mismanagement" of an establishment that is not your own. If the father-in-law and the mother-in-law desire to make their presence in the home of their children a pleasure and a blessing, they will most scrupulously *mind their own business*, difficult as it may be.

A great deal might be said concerning the duty of the daughter-in-law and the son-in-law, but that topic is not under discussion at this moment, and then, too, a sunny-haired laddie is begging me, book in hand, to read to him "about the bears," so here's to the bears.

THE KITCHEN CLUB AT HILLSIDE.

ANNIE L. JACK.

IT is a long time since I have given our readers a sketch of the doings of the Kitchen Club. But in the meantime the season has gone round and with it many changes. The Methodist minister's wife has moved away, and taken with her our best wishes and a new tea set, and new-made graves in the churchyard have made a sad break among the members. "Some are married, some are dead," but everything must be renewed, even as the seasons are, and a few of the ladies met at Hillside to discuss the given topic. It was "Pin-Money," and we found it touched the feelings of all, married or single, though the younger members took a brighter view of the subject than those who had suffered more deeply. Mrs. Chapman read from Scribner's in "Topics for the Times," a wise man's opinion, and, though Miss Whitand said papa was always willing to give her what she asked, we advised all contemplating matrimony to have a marriage settlement however small—something to call their own.

Young ladies, if enterprising, can earn something for themselves outside of their home; art needlework is only one outlet, but women could make for themselves many other ways. Mrs. Welsh read an extract from a paper which was to the effect that a wood engraver, being asked why he did not employ girls, replied that a man engaging in the business undertook it as a life work, but a woman seemed to have no ambition to excel. She does not feel that her independence is to be sustained by it and generally marries, and gives it up as soon as possible. I thought this something of a libel from my knowledge of our sex; but then every one must judge from his or her own experience. Mrs. Tompkins advised ladies to take a specialty in fruit growing—to raise one thing well and of the best quality for spare money, while Miss MacGregor told us she bought all her groceries with the produce of her bees, and thought in bee-keeping there was a field for usefulness, that was open to women.

Some of the young ladies had tried poultry with different measures of success. So much depends on care and perseverance in *everything!* But Mrs. Chapman's remarks impressed us deeply, and we determined that our daughters should profit therefrom. She said "It requires more courage to ask your husband for fifty cents, than it would to take care of your children through the whooping-cough. You work, and save, and manage his household according to your best knowledge; he is what is called a 'good provider;' there is no lack of plenty to eat, or even to wear; but—who has not seen the look—'My good woman, what do you need with money?' 'To jingle it in our pockets, my lord and master, as we did when children, one cent against another; to pay our postage, give to poorer neighbors' children, and to spend it in a hundred other inconsistent ways. So let us, as members of this club, strive to be independent and earn for ourselves if possible, or at least let us teach our daughters the way to attain excellence in one branch of business for profit." We smiled, and commended the energetic lady's remarks, and adjourned to the tea table still discussing the merits of the case.

DOMESTIC RECIPES.

Pie Plant Pie.

Slice very thin into an earthen dish. Allow a large coffeecupful of pie-plant to a large teacupful of white sugar and two teaspoonfuls of flour. Stir together, let stand while making the crust.

A Nice Plain Pudding.

One quart of flour; butter the size of an egg; a pint of milk; two tablespoonfuls of baking powder; one cup of cut raisins. Steam one hour in a two-quart dish. Boil a pint of milk, add sugar, two tablespoonfuls of flour and flavoring for the sauce.

Pumpkin Pie.

As made 100 years ago with this difference that then they made a big panful. I will give you ingredients for one pie. One coffee cupful of stewed pumpkins; two of milk; a small handful of flour; two teaspoonfuls of ginger, a dust of allspice or nutmeg on top—no eggs. Bake in a very quick oven. The crust will not be soggy, if the oven be hot enough on the bottom. MRS. G. C. C.

Bread Muffins.

Take four or five slices of bakers' bread, cut off the crusts, put into a pan and pour over hot water, only just sufficient to soak the slices. Let stand an hour, drain off any liquor that you can, beat the mass smooth, mix in half a pint of sweet milk, two tablespoonfuls of sifted flour, a tablespoonful of melted butter, a little salt and three well-beaten eggs. Have muffin rings as well as baking-pan hot and buttered and fill each two-thirds full Bake brown in a quick oven. Eaten hot.

Apple-Corn Pone.

One quart of finely chopped apples; one quart of Indian meal; scald with a pint of boiling water, add sweet milk to make a stiff batter, then stir in the apples, add a little salt. Bake in a *close* vessel three hours or pour into a tin pail, cover tightly and boil in a kettle of water for the same time. Eaten with sweetened milk or cream. MARY B.

Wanted—Stamping Powder.

Can any of our readers give W. Rasch a recipe for a stamping powder that will stamp on all kinds of cloth?

For Neuralgia, Pains and Aches in the Back, Kidneys or Limbs,—Hop Bitters.

Trees, Seeds, Plants, &c.

CHOICE PLANTS AT LOW PRICES

These collections (Strawberries excepted), *packed to carry safely a thirty days' journey* if the order is sent early. I prepay mail packages; purchasers pay express charges. At these prices no alterations made. Shall be pleased to *double* but can not *divide* a collection.

GRAPES—
1 Prentiss, $1.50. 1 Brighton, 30c.
1 Moore's Early, 60c. 1 Lady, 40c.
By mail, $2.50; by express, $2.25.

STRAWBERRIES—
12 Kirkwood, 12 Marvin, 12 Longfellow, 12 Warren, 12 Brilliant, 12 Glendale, 12 Sharpless, 12 Duchess, 12 C. Downing, 12 Cumberland Triumph, and 2 of the Bidwell. Order early. The supply of Bidwell is limited. By mail, $1.00. By express, $3.00.

HOME NEWS.

MONDAY, March 14, 1881.

MESSRS. Wm. M. Evarts, of New York, Allen G. Thurman, of Ohio, and Timothy Howe, of Wisconsin have been appointed Commissioners to the International Monetary Conference at Paris, to be held in April. Hon. Levi P. Morton has been appointed Minister to France. Mr. Lowell, present Minister to England, has been requested by the President to retain that position.

Judge J. W. McDill, of Iowa has been appointed by the Governor to fill the vacancy caused by Senator Kirkwood's elevation to the Cabinet. Mr. Frye, of Maine, takes Mr. Blaine's seat in the Senate, and ex-Secretary Ramsey will probably succeed Mr. Windom from Minnesota. Angus Cameron was nominated for Senator, from Wisconsin, on the 48th ballot.

On the arrival of the ex-President and Mrs. Hayes, with the family, at Tremont, Ohio, on March 8th, they were met at the depot by about three thousand citizens, and with bands of music and shouts and cheers, were escorted to their residence. There Mr. Homer Everett, in a speech full of cordiality and sincere wishes for their prosperity and happiness, welcomed the ex-President and his family home. Mr. and Mrs. Hayes then held an informal reception, shaking hands with fully two thousand persons.

The Yorktown Centennial Committee, of which Senator Johnston, of Virginia, is chairman, have appointed a committee consisting of the chairman, Senator Butler, of South Carolina, and Representative Loring, of Massachusetts, to prepare invitations. The committee have decided to invite the President and Cabinet, the members of the Forty-sixth and Forty-seventh Congresses and Governors of all the States and Territories. The latter are to be conferred with at once to learn what military organizations contemplate participating in the celebration.

The Whittaker trial is "dragging its slow length along," with no probability of approaching its end very soon. Experts in handwriting have been examined this week, but no one, unless it is Whittaker, knows whether he wrote the note of warning or not. H. B. Claflin, S. V. White, G. I. Seney, H. R. Bennett and Stewart L. Woodford have raised $500 to pay Whittaker's counsel in his court-martial.

A German socialist meeting was held recently in Faneuil Hall, Boston. There were 4,000 present. The speakers were the German socialists, Fritzsche and Viereck, Wendell Phillips, John Swinton and others. Resolutions expressing sympathy with the German socialists were adopted.

The heavy storm of rain and wind on the 9th inst. cleared all the ice out of the Hudson River as far up as Sing Sing. The propeller Leader made its first trip of the season Thursday morning, from that village to New York.

Edison has removed from Menlo Park, N. J., to Fifth avenue, New York, considering his invention complete. He now proposes to light whole cities from central stations.

It is feared that Professor E. D. Sanborn, of Dartmouth College, who has been connected with the institution for 35 years, will soon be forced to give up on account of ill-health. He has also been so unfortunate as to lose most of his fortune by unlucky speculations.

Immigration sets in strongly this Spring, and the arrivals in 1881 are likely to exceed those of last year when they were the largest in the history of the country. During the week just past the landings at Castle Garden numbered 5,323, an increase of 2,479 over the first week of March, 1880.

The Union Pacific railroad has declared a quarterly dividend of one and three-fourths per cent. This rate is likely, hereafter, to prevail. Sidney Dillon was elected president of the road. The surplus earnings for the year were $13,204,000.

Fire was discovered in a room in the basement of the Wisconsin Capitol, at Madison, on Thursday afternoon, 3d inst., but was soon extinguished. The room is used for storing paints and oil, and the fire is supposed to have originated spontaneously in a heap of rags that lay in a corner. During the excitement, "Old Abe," the famous war eagle, screamed and flapped his wings, and being let loose, took a trip to another portion of the basement, and remained there till all danger was over.

John Hay, Assistant Secretary of State, on account of private engagements, will not be able to comply with President Garfields and Secretary Blaine's request to remain in the Department. He has been succeeded by Judge Bancroft Davis, who held the same position under Seward in Lincoln's time.

Mrs. Elizabeth K. Churchill, widely known as a speaker and writer on the rights of women and reform generally, died in Providence, R. I., on the 7th inst. She has been residing near Boston.

Californians are pronouncing eulogies on George W. Ridley, deceased, because he gave a sack of flour which was sold and resold during the war until it netted $50,000 for the United States Sanitary Commission. Giving a sack of flour is a generous thing, but some eulogy ought to be reserved for the man who contributed the most to the $50,000.

Mr. Henry G. Pearson has been nominated by the President to be Postmaster of this city. He is a son-in-law of ex-Postmaster James, and was formerly Assistant Postmaster.

Professor J. M. Van Vleck of Wesleyan University has been appointed by the bishops of the Methodist Episcopal Church as one of the delegates to the Ecumenical Methodist Conference, to be held in City Road Chapel, London, England, beginning on the 7th of September, 1881. The Hon. Oliver Hoyt of Stamford is the only other delegate from Connecticut.

A protracted and bitter controversy, growing out of defalcations in the chemical laboratory at Michigan University, has been closed by the resignation of Prof. Rose, who with Prof. Douglass had charge of the accounts of that department.

The Atchison, Topeka and Santa Fe Railroad made a connection on the 11th inst. at Dinning Junction, where a silver spike was driven in at 3:45 p. m. Engineer O'Neill of engine 503 of the Atchison, Topeka and Santa Fe road ran the first engine to the Southern Pacific road. There was no further demonstration.

A bill has been introduced in the Assembly appropriating $3,000 towards the erection of a monument in memory of General Nicholas Herkimer and his associates in the battle of Oriskany, and to contribute thereto such stone in the locks of the Chenango canal as are not needed by the State.

Miss Barbara Scott, of Montreal, bequeathed $30,000 to found a chair of civil engineering in the McGill College; $2,000 for a classical scholarship, to be called "The Barbara Scott Scholarship;" and $2,000 to the building fund of St. Gabriel Church, of Montreal.

It is said the postal card has decreased the sale of writing paper $12,000,000 annually in the United States.

Twenty-eight men and women formed a cremation society at New York lately with Rev. J. D. Benglass, a chaplain in the United States navy, as president. All active members will be cremated free of charge at death. A company with $50,000 capital is to be incorporated.

A large stone weighing 2,000 pounds, in the flouring mills of August Fischer, of Chicago, burst recently with a loud noise, and three persons were seriously injured by the flying pieces. The stone was an imported article, four feet in diameter and one foot thick, and was making about 275 revolutions per minute.

[La Crosse Republican Leader.]

Having been cured by St. Jacobs Oil, I recommend the same to all sufferers with Rheumatism, says Mr. L. Shiffman, 2804 Calumet Ave., Chicago, Ill.

FOREIGN NEWS.

The Czar of all the Russians, Alexander II, has at length been murdered by the Nihilists. Yesterday he attended church in the morning in St. Petersburg, and afterwards witnessed a military parade. While returning from this to the Winter Palace in a closed carriage, escorted by eight Cossacks, an Orsini bomb, made of glass and charged with nitro-glycerine, was thrown at the carriage and exploded just behind it destroying the back part of it. The Czar and his brother, the Grand Duke Michael, alighted unhurt. The coachman begged the Emperor to re-enter the shattered vehicle, but he moved a few paces to see some of his escort that had been wounded. The thrower of the bomb was at once arrested and tried to shoot the Czar, but the pistol was knocked aside. At this moment a second bomb was thrown by another person at the Emperor's feet, and instantly exploding, shattered both legs below the knees, severely injured the lower part of the body and tore the left eye out of the socket. The Emperor fell with a loud cry, and was taken to the Winter Palace, close at hand, in an unconscious condition. He lingered for nearly an hour and-a-half and died at 25 minutes past three, the only word he uttered having been the name of the Czarewitch, his eldest son, who was at once proclaimed emperor on the Czar's death. A Cossack and a passer-by were killed by the explosion, and two or three others severely wounded. The thrower of the second bomb was also instantly arrested, and one of the wretches is said to have been so roughly handled by the angry populace that he died. The name of the first assassin is said to be Poussakoff. Both were disguised as peasants, and stood on opposite sides of the road that runs by the imperial stables close to the Winter Palace. Intense indignation is cablegrammed from St. Petersburg and all the European capitals. All the troops in the Russian capital are under arms in their quarters. All the members of the royal family in the city at once hastened to the death-bed of the dying Emperor. Immense crowds thronged the streets; a cordon of Cossacks encircled the spot where the assassination took place. Telegrams were at once sent all over the Empire and to all foreign courts and capitals, announcing the calamity. Messages of condolence were at once sent by all governments, including our own, to the Czarewitch and the Imperial family. The news of the death of his Imperial nephew is reported to have been a terrible shock to the aged Emperor of Germany.

What influence the death of the Czar may have upon European affairs it is as yet hard to predict. This morning's cablegrams announce that Greece is resolved upon war with Turkey, as the latter seems determined not to yield all the territory claimed by the former. The question is now being discussed by the ambassadors of the Great Powers in Constantinople; it is probable that Greece will restrain her 75,000 men, at least until the disposition of the new Russian autocrat becomes known with regard to the "Eastern Question." Hitherto he has been considered as favorable to the "Old Russian" party, and therefore hostile to foreign influence in Russia, and especially to German influence.

The late Czar was born April 29, 1818, so that he had nearly completed his sixty-third year. He mounted the throne on March 2, 1855, on the death of his father, the iron-willed Nicholas, and for a year continued the Crimean War, in which Russia was single-handed against Great Britain, France, Sardinia and Turkey, with Austria a passive enemy. After the fall of Sebastapol on September '55, negotiations for peace were begun, and the Treaty of Paris finally put an end to hostilities in March, 1856. Since then the Emperor's career has been that of a reformer: he released Russia from military routine, discipline and dictation: annulled the impediments against Russians visiting foreign lands; granted a general amnesty to thousands of Poles and Russians condemned to Siberia during the preceding reign. His greatest measure of reform, however, was the emancipation of the serfs, which was decreed March 3, 1861, and carried out the two following years. The first attempt on his life was made April 15, 1866. A second attempt was made during his visit to the Paris Exhibition in 1867. The three late attempts on his life by the Nihilists have been already noticed in these columns:—that of Solovieff, who on April 2, 1879, fired three times at the Emperor in St. Petersburgh; the attempt last year to blow up the train on which he was traveling from Livadia in the Crimea to Moscow, and the other attempt a little later, to destroy him by blowing up the dining-room of the Winter Palace, while he was at dinner.

AGRICULTURAL NEWS.

AT Russell, Kansas, on April 13, 40,000 head of sheep are to be sheared by machinery..... The Indiana Legislature has voted against a law to compel owners to keep stock under fence, on the ground that it would be cruel to compel the poor man to shut up or pasture his single cow..... Accounts all over the country agree that bees have suffered severely in winter-quarters from starvation, dysentery, etc..... The seventeen-year locusts are expected to appear in June next in Marquette and Green Lake counties, Wis., in the neighborhood of Wheeling, W. Va., and in parts of Maryland and Virginia. They may also appear in Northwestern Ohio, Lancaster County, Pa., and Westchester County, N. Y. The thirteen-year locusts will probably be seen in Southern Illinois. The potato-bug will be found wherever there is a potato planted, without regard to State and county lines. The lightning-rod man will be out also early in June .....One of the largest peach orchards in the world is in Chambers County, Ala., near the Georgia line. It contains 250 acres and has yielded in past seasons $70,000 worth of fruit.....The following is a summary of the seed distribution by the Agri. Dept. of field and garden, and flower seeds during the year: To Senators and Members of Congress, 759,679 packages; agricultural societies, 17,444 packages; statistical correspondents, 139,729 packages; granges, 355,452 packages; special farmers, 127,644 packages; miscellaneous applicants, 181,305 packages. Total number of packages, 2,581,253.....The Colorado Cattle Growers' Association, in session at Denver, the other day, adopted a series of resolution regarding pleuro-pneumonia, concluding as follows: "Resolved, That we recommend a convention, to be held in Kansas City in September or October next, in the interest of Western stockmen, for the purpose of creating combined action in pressing the necessity upon Congress for national legislation on the subject of contagious diseases of live stock, and that we solicit correspondence on this point."

Fuel has been so scarce in Minnesota during the recent snow blockades that many families have burned hay and unthreshed wheat, and Appleton, a village of 400 to 500 people, did not have more than half a cord of wood and two or three tons of coal last week in the whole town. In other places two or three families have crowded together in one house and burned the vacated dwellings..... Two pickeling factories at Pleasantville, on the Hudson River, have used this season, 11,000,000 cucumbers.....Our butter trade with France is rapidly increasing. Up to Saturday, February 21 we had exported 324,629 pounds this year. How much of it was oleomargarine?.....Large quantities of hay are being imported from Canada to this city and Philadelphia. The import duty is 20 per cent.; the freight to this place, $50 per carload; wholesale price here in bales, $20 to $24..... .....Very full reports from the wheat region tributary to St. Louis, show that hitherto damage from the cold weather has been trifling; the acreage is much larger than last year, and the prospect is good for a large crop. Reports from Illinois are equally favorable.....At the late meeting of the Illinois State Board or Agriculture held at Springfield, Peoria was selected as the place to hold the State Fairs for the next two years.

A beet sugar factory is to be built at Berthier, Province of Quebec, Canada.....The average yield of Indian corn per acre throughout the United States is 29 2 bushels .....Advices from Texas say that the cold wave that swept over the State during the 10th, 11th and 12th of February, was more disastrous to stock than any that had preceded it this Winter. The herds and flocks had become emaciated and weak, and many animals were unable to stand the severe weather..... From the returns of Australia it appears that more than 2,500,000 acres of land are sown in wheat, being twice the area some eight years ago. The average yield was about ten bushels per acre. The largest wheat-growing district, South Australia, has an average of little more than seven bushels per acre, while New Zealand averaged nearly twenty-three bushels and New South Wales fourteen and three-fourths bushels per acre.

The Michigan Legislature has just passed a bill "for the protection of dairymen and to prevent deception in the sale of butter." It provides that all packages composed in part of suet or tallow shall be plainly branded "Oleomargarine," and that all made in part of lard shall be branded "Butterine," together with the name of the manufacturer in each case. A proper penalty is provided for failure to obey the law.....The Anti-Monopoly League lately started here is spreading like "wild-fire" all over the country. Branches have already been established in 25 States, and others are being constantly organized. Farmers—as they ought—are taking a lively interest in the movement.....The gross income derived from tobacco by farmers in the United States is stated at about $22,000,000.....Good English landlords are still returning to their tenants from 20 to 50 per cent. of their rents.....In Germany the weather has been dry and pretty favorable for farming operations .....In the Argentine Republic the harvest has been good, but there is not much surplus wheat for export.....In France the weather has been dry and frosty, and Spring cultivation is being proceeded with; the growing crops are generally spoken of favorably.

Late advices from Australia say that the harvest has been unusually heavy in New South Wales. Grass was very scarce and a water famine was threatened; bush fires were raging in several parts of the colony, and caused a great destruction of fences and grass.....In Victoria much satisfaction was felt at the success of an experimental export of fresh meat to England ....An extremely successful Wool Exhibition had been held.....Powell Brothers, of Springboro Pa., made two importations of choice Clydesdales last month; all arrived here in excellent condition.....On February 28, the Annual Meeting of the Clydesdale Horse Society of Great Britain and Ireland was held at Glasgow, Scotland. The third volume of the Stud-book was to be issued within a week. From reports it seems that exports of Clydesdales to the Continent, the colonies and this country are rapidly increasing, while in the United Kingdom these horses are becoming prime favorites.....

The New York Legislature has passed a bill abolishing canal tolls on west-bound freight.... Earnest Flagg, manufacturer of oleomargarine in this city, has failed, and is accused of "sharp practice" with his creditors.....Bradstreet's of the 12th of March contains despatches from Cincinnati and tributary points, Chicago, Louisville, St. Louis, St. Joseph, Kansas City, Indianapolis, the Iowa pork centers, and Milwaukee, in response to the charges made abroad concerning the prevalence of hog cholera and trichinosis in the United States. They report a healthier condition of hogs than for years previously, and say there is no ground whatever for apprehension. Some of the correspondents stigmatize the charges as a "bear" movement.

The River Platte wheat crop for 1880–81 has been variously estimated. This crop in the cluster of Santa Fe colonies around Esparanza and San Carlos aggregated 937,600 bushels against 300,000 bushels for the previous crop. The chief export is expected to be Flour. Adelaide, South Australia, advices of the 8th of January, 1880, state that the Government statistics of the Wheat crop of 1880 made 11,205,040 bushels for that colony, of which 10,747,146 bushels had been shipped up to the close of 1880, leaving a residue to bring forward into 1881 of 457,894 bushels. The crop being harvested in January and February, 1881, will not be equal in either quantity or quality to last year's outcome. It is estimated that the crop of 1881 will give an average yield of six bushels per acre, which will make an export surplus of about 6,533,333 bushels. The harvest on January 8, 1881, was in full swing with the weather all that could be desired.

There is now quite a free movement of grain from St. Louis, via the Mississippi River to New Orleans, which is indicated by the export clearances from thence to Europe. The boat "Oakland" took eight barges in tow on the 6th inst. for New Orleans. The barges carried 263,000 bushels of corn and 90,000 bushels of wheat for export to Europe. This is said to be the largest amount of grain ever taken down the Mississippi River in one tow of barges .....An insurance company has been formed in Prussia to insure against loss of hogs by trichinæ.....Mr. Lancaster, near London, has 46 acres of celery, and his celery commands the highest prices in market. His plantation, at 10,000 plants per acre, requires 460,000 plants. They are set in trenches, and vast quantities of manure are used. Seven horses are used in his 50-acre vegetable garden. Radishes between the celery bring about $140 per acre, and the celery $250 per acre. The labor comes to $250 per week in Summer and Autumn.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, MARCH 12.

Did You Know It?

Some people suffer for years from weak kidneys and torpid bowels and liver. If you know such a person tell them that Kidney-Wort is a certain cure. It can now be had in either liquid form or as a dry vegetable powder. The same effect either way.—Evansville Tribune.

Women that have been bedridden for years have been entirely cured of female weakness by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

$25 in Doctor's visits, will do you less good than one bottle of Hop Bitters.

BURNETT'S COCOAINE

Has Received Universal Endorsement.

No other preparation possesses such remarkable properties for embellishing and strengthening the hair and rendering it dark and glossy. It cures baldness and eradicates dandruff.

Burnett's Flavoring Extracts are the best.

The Markets.

HAY AND STRAW—The stormy weather has interfered with trade and receipts of Hay have accumulated. First quality coarse Eastern and Northern at $22@23 ℔ ton; poor and medium at $18@21. SEED—Calcutta Linseed nominally $2@2 10 ℔ bu; and Western Flaxseed is quiet, $1 40@1 45 ℔ bush. Clover Seed at 8½@9½c ℔ lb for Western and New York; Timothy at $2 25@2 90; Red Top at $2 30@2 40 ℔ bag; and Canary Seed at $2 45@2 55 ℔ bag.

Chicago.—Wheat firm No 2 Red Winter, 99½c; @$1 01½; No 2 Chicago Spring, 99½c@$1 00½ cash, $1.00½, April; $1 04½@1 05, June; $1 04½ May. CORN firm 38c.@33½c, cash; 33½c.@33¾c. April; 42½c@42¾c., May. OATS steady at 28c@31½c, cash; 29½c.@29¾ April; 33½, May. RYE firm at 98c @$1. BARLEY steady at $1.05. PORK active, at $15 50, cash and April; $15 62½@15 65, May; $15 75@15 80, June. LARD active, but lower, at $10 55, cash; $10 55@10 58½, April; $10 65@10 67½ May. Bulk-meats active firm, and higher; Shoulders $5 10; Short Rib $8 Short Clear, $8 40. BUTTER Trade was fair, and the prices given below were easily realized: Creamery 30@34c; Dairy choice 25@28c; Dairy, fair to good 20@23c; Ladle-packed 16@20c; Packing stock 13@15c; Roll butter 15@20 Grease 8@10c. CHEESE.—There was a good demand for fine goods and such were firmly held. Full cream 12½@13½c; Part skim, choice 10½@11½ Part skim, fair to good 9½@10½; Part skim, hard 7½@8½; Low grades 4@6c. SEEDS.—Prime clover quotable at $5 00, prime timothy at $2 60, and flaxseed weak at $1 20. Other kinds were neglected. Sales were made of 505 bags timothy seed at $2 56@2 61 for good to choice. Hogs good demand; common to fair mixed, $5 30@6 50, light $5.50@5 80 choice heavy, $5 90@6 50; nearly all sold at an advance of 5c. CATTLE market quiet and weak; prices steady; common to fair shipping, slow at $4 @4 50; good to choice, $4 65@5 20; exports, $5 40 @5 60; no extra offered; butchers' and canning, $2 50@3 75, mainly at $3@3 25; stockers and feeders scarce and wanted at $3 25@4 25. SHEEP good demand; common to medium, $4 50@5 25; choice $5 50@5 90.

Cincinnati.—WHEAT in good demand at full prices; No 2 Red Winter, $1,06; CORN quiet; No. 2 Mixed 44c. OATS in fair demand and firm; No. 2 Mixed, 37c @37½c. RYE easy; No 2 at $1.12@$1.14. BARLEY strong; No. 2 Fall, $1.03@$1.05. PORK easier at $15 25. LARD firm at 10½c. Bulk-meats quiet; Shoulders, $5; Clear Rib, $7,95. Bacon stronger; Shoulders, $5.90; Clear Rib, $8.80; Clear Sides, $9.12½.

St. Louis, Mo.—WHEAT higher, but slow; No. 2 Red Fall, 1,02½@1 02½, cash and March; $1.03⅞@$1 04, April; $1 05⅝@$1.05⅞, May; $1.03½, June; No. 3 do, 99c @99½c; No 4 do, 93@93½c. CORN 39½c.@39¾c., cash; 39¾c @40c., March; 40½c @40¾c., April; 41c @41½c., May and June. OATS firm, but slow at 33½c., cash; 33¾c. bid, March; 33½c., bid, April. RYE firm at $1 02½@$1.03. PORK steady at $15.65@15,75, cash; $15.55 bid, March and April. LARD firm at $10 30 bid. Bulk-meats firm; Shoulders, $5@5.05; Clear Rib, $7.90@$8; Clear Sides, $8 20@$8 25, Bacon dull; Shoulders, 5¾c.; Clear Rib, 8¼c.; Clear Sides, 8¾c.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 12, 1880.

BEANS AND PEAS.—The feeling among holders of prime beans, and the offering is of prime average thus far it quite firm, Sales are making in white 5c. below what last week, but there are marks that are held above quotations. No animation in red kidneys, Green peas firm at $1.70@1.75 for good and $1 80 for selected Wisconsin. Southern B. E. peas steady at $2 10@2.15.

Marrow beans prime $2.10, do, other $1.95@2 00, medium prime $2.10, do. other $1.95@2 pea $1.90 @2 10 white kidney $1.90@2.10, red do. prime $1.55@ 1.65 do. other $1.40@1.50, black or turtle soup $1.40, Lima $4.50@5.

BEESWAX.—A moderate trade is in progress, with 24½c@25c. quoted.

BUTTER.—Business is still running in its recent channel. Strictly fine grades are warring with the approach to Spring, and nearly all owners offer stock freely We say nearly all, for there is an old-fashioned line of trade which remains in this city that will use good-flavored, grass-bodied butter up to the latest period. This has to be catered for and a number of sound, sweet, honest dairies or selections of same are held with a view of furnishing a sure demand. As before, very common goods which, however, are mostly to be seen in late Western receipts drag and have more of a range price than a settled line of quotations. Supplies at the moment are moderate, as railroad transportation is not clear.

Creamery: choice fresh 34@35c fair to prime, 28@ 33c.; Fall, 23@28c.; Summer, 19@23c.; State dairies, entire choice, 23@24c; poor to good, 16@20c.; firkins, range 16@23c.; pails and half tubs, choice, 28@27c; other, 15@22c; Welsh tubs, best Fall, 24@25c; other, 16@22c; Western imitation creamery, 22@23c.; dairy, fresh, 23@24c; other, 14@22c; factory, fine, 20@21c.; other, 13@15c., very poor, 11@12c.

Receipts for week 14,830 pkgs.

Exports do., 3,100 do.

CHEESE—Exporters have been doing little and the home demand has been moderate. Prices have not varied materially. Here and there an effort to close out supplies has led to an easier price, but as a rule supplies are carried along with confidence. Quotations are for

State factory, fancy, at 13¼@13½c.; do. good and prime, 12¾@13c.; do. fair, at 11¾@11¾c.; do. half skimmed, 9¾@10½c.; Wisconsin factory, fine, at 12¾@ 13c.; do. good to prime, 12@12½c.; do. fair to good, 11@12c.; Ohio factory, fine, 12½@13c.; do. good to prime, 11¾@12¼c.; do, flat, fair to good, 10¾@11½c.; do. poor to fair 8@10c.

Receipts for week, 12,192 boxes.

Exports for week, 19,065 boxes.

Liverpool cable, 68s.

Steam to Gt. Britain, 25s.@30s.

COTTON.—There has been a sharp pressure to sell this week and lower prices have resulted. The cause has been "too much cotton," with the dull look of the foreign markets, and the wants of the spinners moderate. Latest prices are for

March, 10.68@10.69c.; April, 10 68@10 69c.; May, 10.79 @10.80c.; June, 10.88@10 90c.; July, 10.99@11c.; August, 11.03@11.05c.; September, 10.60@10 62c.; October, 10 31 @10 33c.; November, 10.21@10.23c.; December, 10.21 @10,23c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Receipts for the week, 25,988 bales, Exports do. 11,041 do.

DRIED FRUITS.—Apples have a moderate export trade and hold to steady prices. Peaches move out slowly. Small fruits are quiet. Quotations:

Evaporated apples at 8@8½c. for the better qualities; sliced apples at 4½@5¾c. for good to choice North Carolina; 4@4½c. for Va. apples, 4@4½c. for Tenn. do; 4½@5c. for State do; 4½@4¾c. for western, Ohio and Mich. Peaches at 23@ 9c. for evaporated peeled; 13½c. for unpeeled do.; N. C. peeled at 19@ 22c; for the better qualities, unpeeled peaches at 6@6½c. for halves and 6c. for quarters. Plums at 15@16c. Blackberries at 7½@8c. Cherries at 17½c. Raspberries at 23c. Whortleberries 10½@11c.

Receipts for the week, all kinds, 1,093 pkgs.

Exports dried apples, 4,974 pkgs.

EGGS—Receipts for week, 11,641 bbls.; do. last week 9,331 do. There are at the moment two styles of sellers in the market one has great faith in the possible falling off in supplies before the active season of Lent is over, while the other adopts the sensible plan of giving consumers the full benefit of the lower fluctuations that have attended the market during the week. The market closes weak at following rates:

Near points, 19c.; Pa. and State, 23½c.; Western 18½c.; Southern, 18c.

FRESH FRUITS.—Apples have softened badly during the week and many parcels for which a good Spring outlet was expected are rolled to wagon venders or anybody who can handle rejections. Choice sound dry fruit is firm but not selling in a wholesale way. In fact it is a remark in the trade that single barrels can be had as low as, mixed lots $1 75@1 50; Baldwins and russets $1 62@1,75; greenings $1,25@ 1.50; very common lots upon which the buyer takes all risk 50@$1. Cranberries quiet, a return of buyers would find an easier market, Nominal rates. Cape Cod bbls. 44@7, crates N J, $1.25@1.87. Fla. oranges winding up with an improvement, the range is $1.50 @4 for poor to best bright out cases. Fla. strawberries in good demand when prime, poor to perfect 50c.@$1 per quart; hot-house berries $1,50@2, grapes scarce this season. Peanuts have rather more activity at late prices. Va hand-picked, 4¾@4¾ other, 3½@4; shelled, 3½@4½. Hickory nuts a drug at 75@85 per bush. of 50 lbs. Pecans 7@8c. per ℔.

Exports of apples for week, 16,500 bbls

FLOUR.—Shippers have bought less freely, the exports for the week being 8,000 sacks and 1,600 bbls. The home trade demand has been fair. Prices have shown firmness, and in instances a slight advance,

Latest prices are: $4.15@4.15 for very inferior to very choice winterline State and Western: $4.25@4 60 for poor to choice extra State and Western, odd lots and lines; $4.50@4 65 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4 35@5.25; good to choice do at $5.35@6.10, (very choice up to $6.25@6.50 and fancy at $6.50@6 75;) red and amber winter wheat inferior to choice trade and fancy at $4.35@6; round hoop Ohio, $4.40@4 75; and trade and family brands of do. at $4.85 @6.25, the latter for very choice; St. Louis $4.60@5 50 for inferior to good extra; $5,50@6 35 for good, to choice, and up to $6.75@7 for very fancy brands; Minn. clear, inferior to very fancy at $4 35@5; Minnesota "straight," poor to very choice, at $5 25@6.75, and patent inferior to fancy at $5.75@8,25; city mill extra at $5.55@5.65 for fair to choice for the West Indies; do. for England at $4.30@4.65 for poor to choice spring wheat; do. trade and family extras, $5.55@6.15 do, for South America $5.65@6.00, the latter for very choice; No. 1 at $3 10@3.65 for very inferior to very fancy.

Receipts for week, flour, bbls. 117,410 corn meal, do. 675; wheat, bush. 395,700; corn, do. 420,175; oats do. 214,670; rye, do 15,200; malt, do. 26,000; barley, do. 41,212; beans, do., 7,716; rice, pkgs. 2,511.

Exports for week, flour, bbls. 102 335; corn meal, do. 4 520; wheat, bush 1,131,263; corn, do. 451,567; oats, do. 2,000; peas, pkgs. 2,004; beans, do. 470; rice do 699.

GRAIN.—Wheat has had freer export demand, the shipments for the week being 994,000 bush. Speculative trading has been good; prices have shown frequent changes and closed firm, latest prices are for

No. 1 white at $1.18@1.18½, do. March at $1,18¾@ 1,18¾; do. April at $1.17¾@1.18¾; do. May at $1.16¾@ 1.16¾. No. 2 white at $1.17@1.17¾; ungraded white at $1.16@1.17¾; mixed winter at $1.18¾; No. 1 red at $1.20¾@1.20¾; No. 2 red at $1.21¾@1.21¾; do. March at $1,20¾@1.20¾; do, April at $1.20@@1.20¾; do May at $1.19¾@1.19¾; do. June at $1.18¾; No 3 red at $1.18¾ @1.18½; ungraded red at 80c@$1..0¾; ungraded spring at 85@95¾c.

Rye firm; quoted at $1.04 for full lots.

Corn is active and strong; shipments for the week, 142,0 0 bush; latest prices are for

New York No. 2 at 58¾@59c, do. March at 58¾@53¾c do. April at 56¾c., do May at 54¾@55, do. June at 51¾@52c., No. 2 old crop at 67¾, No. 3 at 56¾@56¾; ungraded mixed Western at 56@58¾; New York steamer mixed at 57¾@57¾, New York steamer yellow at 57¾@57¾; Southern white at 61c.

Oats advanced early in the week but closed more in favor of buyers, with a moderate trade. Latest prices are for

No. 1 white at 47¾; New York No. 2 white at 45¾ @45¾; No. 3 white at 43¾@44 N. Y. No. 2 at 40¾@44, do. March at 43¾, do. April at 43¾@43¾; do, May at 43¾@43; No. 3 at 43; ungraded white Western at 44¾@47¾; ungraded mixed Western 42¾@45; white State at 45, No. 2 Chicago quoted at 44.

HAY AND STRAW.—Demand is fairly active and prices showing firmness. Quotations are for

Hay, prime timothy at $1.15@1.20@100 lbs.; medium timothy at $1,10@1.15 do.; shipping grades at $1@1.05 do.; clover mixed at $1.05@1.10, clover at $1@1.05. do. Straw—No. 1 rye at $1,20 ℔ 100 lbs.; No. 2 rye at 80@85c. do.; oats and wheat at 80@85c. do.

The custom of storing hay in the city is becoming less and less a feature. At one time after the close of navigation the trade depended largely upon Fall storage and crammed barges that were kept at this end of the route. Now the bulk of hay used in and exported from New York has a steady railroad delivery, with commodious platforms, where enough can be held, in case of delayed trains, for pressing wants. The railroad system is also very convenient for shipping purposes: the business being greatly facilitated by the fact that a vessel can load direct from the station, instead of losing time by waiting for truck loads from storehouses. What is termed shipping hay also represents the grade used by car and stage routes. There used to be a wider classification in shipping and prime hay, but the enlarged use of good common has brought about a higher standard of the former. The past Winter, with its stiff prices, has developed a new source of supplies in the way of daily arrivals from the Western States. Canada, before, was the resource in case of a small domestic crop, but this season we have used all the Dominion could spare and have found room for the product of more remote points.

Exports for week, 254 bales.

HOPS.—Exports for the week have been 727 bales, and from Sept. 1, 35,716 bales, with for the corresponding period the previous year 41,337 bales. The market has a firm tone and is fairly active. The larger movement in the interior on wants of exporters has most influence. Quotations are for

	Cents per ℔.
New Yorks, crop 1880, choice	22 @23
Do. medium	19 @20
New Yorks, crop 1880, low to fair	15 @17

Wisconsin, crop 1880	16 @22
Yearlings, crop 1879, choice	12 @18
Olds, all growths	4 @10
Bavarians	30 @35
Pacific coast, new	19 @23

Receipts for week, 2,212 bales,

Exports do., 968 do.

LEATHER.—Quotations for hemlock sole are, 23 @23c. for light: 22½@25c. for middle; 22½@24½c. for heavy, and 20@22c. for good damaged.

OIL-CAKE.—Western is quoted at 29.50 per ton.

POULTRY AND GAME.—Receipts of dressed poultry are light and prices are unusually strong. A feature of the week is a sale of Vermont frozen poultry amounting to $20,000. Turkeys and ducks, 19c; chickens and geese, 15c. The demand is unusually good for Lent, Western frozen poultry quoted 18c.

Turkeys, small choice, 15@16c, other, 12@14c. Chickens, broilers, 24@25c.; Phila., 17@19c.; other 13½@15c. Fowls and chicks, 12@14c.; fowls, dry-picked, 14@14c.; other, 11½@13½c. Capons, large, 23c.; small and slips, 18@20c. Ducks, choice, 18@20c.; other, 14@17. Geese, extra, 12c.; other, 7@11c. Squabs, white, $3@ 3.50 ℔ doz. do. dark, $1 50@3.

Live poultry is active and high, stimulated by a demand for an approaching Jewish holiday.

Fowls, N. J., 14@15c.; other, 13½@14½c.; roosters, 8@10c.; turkeys, 14@15c.; ducks, choice, $1@1.25; other 75c @$1; geese, extra $2,25; other $1 25@2.

Wild pigeons have a quick sale at $1 75@2.00 ℔ doz. Wild ducks are unsettled; Western very slow, Norfolk Canvas-backs $1@1.25; Havre de Grace $1.75; Western 60@75c.; Havre de Grace red-heads, $1@ 1.25 Norfolk, 75c@$1; Norfolk mallard and black, 10@60c.; Western mallard and red-heads, 40c.; common, including teal, 30@30c.

PROVISIONS.—Hog products have tended higher on an active demand

Mess pork quoted at $15,60@16 for old and $16½@ 16¾ for new, $16 for April delivery add $16,10 for May delivery. Bacon at 8@9 for long clear and 9 for short clear. Beef at $21@23 for city extra; India mess 10 tcs.; $ 0.50 for extra mess in barrels and $9.50 for plain mess in bbls. Beef hams at $23@23. Lard—Western steam at 10.85 for spot lots; 10.8 ¼ for March; 10.85@10.87½ for April, 10.92½ for May and 10.95@ 0.97 for June, Steamer at 11¼@11¾. Tallow at 6¼@6¾ for prime.

Receipts for week, beef, bbls and tcs, 669 pork, 1,750 bbls.; cut-meats, 23,799 pkgs; lard; 15,764 pkgs.

Exports for week, beef bbls and tcs., 2,580, pork, 4,775 bbls.; cut-meats, 17,657,853 lbs.; lard, 7,150,450.

TOBACCO.—Exporters have been buying moderately and the home demand fair, with prices well sustained. Quotations are for

WOOL.—The market has been rather more active this week and the position is somewhat steadier, without, however, any advance made, prices standing essentially as quoted last week.

LIVE STOCK MARKETS

NEW YORK, Saturday, March 13, 1880.

BEEVES.—Receipts for the week 11,618 head; do. last week, 13,407 do. The week has been an unsatisfactory one and many lots of Chicago and St. Louis bought cattle have made a loss to owners. Prices, compared with Wednesday, were a shade stronger on good to prime steers, but common to medium stock kept adding to sellers' losses. Some rough Michigan oxen sold at 7@8c. to dress 56 ℔s. The bulk of the sales were at 9@10¼c. to dress 56@54 ℔s. for ordinary to very good steers, though 8¾c, was sometimes quoted, to dress 55 ℔s. A few fine quality loads sold at 11¼@11¾c. to dress 57 ℔s.

MILCH COWS—Dull, with a nominal range of $40@ 50 ℔ head, a few selected at $60. The latter grade of milkers are worth quite as much at home as here.

VEAL CALVES.—Live calves have ruled steady and firm. Dressed, with uncertain weather, have had an irregular place: best State, 10c.

Live calves, choice, 8½c.; fair to prime, 7@8; poor, 5¾@6½c.; Mt. Holly, 6¾@8¾c.; buttermilk, 6@8; grassers, 5@6c; dressed choice, 10½c.; fair to prime, 8¾@10c.; very poor and poor, 5@7c. Calves that dress under 60 ℔s. are confiscated by the police.

SHEEP AND LAMBS.—Receipts for week, 28,121 head; do. last week, 26,678 do. Sheep have sold briskly, as smaller receipts are indicated for next week. Sheep, 5¾@6¾c.; a few wethers at 7c.; yearlings, 6½@7½c; a few extras 7c. Spring lambs quoted $8@9 ℔ head.

SWINE.—Receipts for the week, 20,425 head; do. last week, 31,744 do. Market steady common mixed Western, 5¾@ 5¾c.; prime corn-fed hogs scarce and wanted; 6@6¾c; country dressed pork, light, 5@8¾c.; medium, 7¾@7¾c.; heavy, 7¾c.; city dressed, 7¾@7¾c. The season is growing short for very heavy hogs. Pork tenderloins, 11¾c.

Ref., *Irving National Bank*, New York City.

A CARD FROM CONRAD WILSON.

THE suspension of "The Business Farmer," though unavoidable at the time it occurred, does not by any means terminate the work intended, nor will it necessarily prevent the final attainment of some objects deemed important. But the new departure now proposed requires a change of base, and some variation in the plan. Having nearly recovered from the late severe prostration to which, for a time, I was compelled to succumb, I now feel warranted in resuming my work, in which already some results have been accomplished, while others more important are left unfinished.

In justice to other parties, it is proper to say here, that the company who have hitherto co-operated to aid my efforts have been prompted from the first by unselfish motives, and a deep interest in farming topics rather than with a view to pecuniary profit. It ought also perhaps to be further stated, that soon after the company was formed we lost the services of the two most efficient parties. The Rev. Mr. Brown was suddenly removed by death, and Mr. Charles Cook was called away on private business in Canada. Yet no wish has been expressed by the company to abandon the paper. On this point, however, it is incumbent on *me* to say, that I could not expect, nor can I even consent to, any further effort on their part to sustain the paper, since the cause of interruption was no fault of theirs.

Periodicals are often transient, but *Truth* survives. If the doctrines of "The Business Farmer" are sound, their future is assured. The journal may disappear, but the work will go on through other channels. To my friends and patrons I owe a debt of gratitude, and they will hear from me at intervals that I trust will not be few or far between. All subscribers who have renewed for the present year will find the matter arranged to their satisfaction.

In another column of this journal I have presented a few comments on some Feeding experiments of great value conducted by parties whose views, experience and reputation, give much weight to their teaching.

New York, March 8. Box 2695.

GOLD MEDAL, PARIS, 1878.

FARMING FOR BOYS AND GIRLS—NO. 15.

HENRY STEWART.

Artificial Fertilizers.

PLANTS cannot live or grow without food. They are provided with organs for taking in food, precisely as animals are, but as they are fixed in the soil they cannot, like animals, go from place to place in search of food, but this must be brought to them. And the supply must be liberal, or the crops will not be large enough to pay for the labor spent upon them. The farm, as a rule, cannot keep itself supplied with manure, and a farmer is obliged to look to other sources to make up the needed supply. Fortunately, we have many of these sources from which fertilizers can be procured, and as these are not made on the farm in the *natural* manner, they are called *artificial*. The most commonly used of these fertilizers are lime, guano, bones, superphosphate of lime, gypsum and the potash salts.

Lime is very largely used as a manure. It is made from limestone by burning it in kilns, by which the character of the stone is entirely changed. If we take a piece of marble, which is limestone, and put it into water, or to the tongue, no change occurs, and no taste is perceived. But when this stone is burned and made into lime, we have a very different substance. If we put it into water, it begins to crack and swell and fall apart, and becomes so hot as to set fire to wood that may be in contact with it. If we put the tongue to it we find it to taste very strong, to be hot and pungent, and if the contact is prolonged it will destroy the skin. If a very small piece of it enters the eye by accident, the eye is seriously injured and sometimes the sight is lost. This is because in burning, the lime has been made caustic, and in this state burns and corrodes any moist, organic tissue which it touches. The substance must be moist, because moisture is necessary to any chemical decomposition, and we shall see how this behavior of lime is due to a chemical action. Limestone contains lime and carbonic acid, 56 lbs. of the former to 44 lbs. of the latter in every 100 pounds. By burning 100 pounds of limestone the 44 pounds of carbonic acid is driven off into the air and we have 56 pounds of lime left. But the lime immediately strives to get back to the condition of limestone which is natural to it, by seizing upon the carbonic acid again, and uniting with it. Therefore if the lime is brought into contact with any organic substance, either vegetable or animal, it burns, corrodes or decomposes it in the attempt to take from it whatever carbonic acid it may have about it.

This is precisely the action of a fire which deprives carbonaceous substances of its carbon. But lime has also a very strong affinity for water, as may be seen if we put 53 pounds of water to 66 pounds of lime. The lime takes up all the water, swelling up and falling to a fine powder, but yet remaining as dry as before. The water has chemically united with this lime and we cannot see it any more, and in forming this union it has given out a great heat, sufficient to inflame wood. When, therefore, a piece of lime comes in contact with any moist substance, it instantly robs it of the water it contains, and in doing this it destroys the tissue and causes it to rot and fall to powder. This is, then, what is meant by a substance being caustic. Now it is upon this peculiar property of lime—as well as on account of its behavior to some mineral substances in the soil which may be spoken of hereafter—that its value to the farmer depends. Let us follow up its action when applied to a field.

The farmer plows the soil and mixes with it the roots of the previous crop and the remains of former crops: weeds, or manure that has been applied in former years. He procures some lime and exposes it to the air until it has absorbed some water and has fallen to a coarse powder; this is done that it may be spread conveniently. He spreads the lime evenly on the plowed ground, and harrows the surface so that the lime and the soil may become well mixed. Every particle of lime that comes in contact with a fragment of vegetable matter in the soil begins to corrode it, to rot and eat it away, by taking its carbonic acid and its water from it; and it soon reduces it to perfect decomposition. It is then soluble, and when the farmer sows his seed and the seed sprouts, and throws out roots, the root hairs, or the plants' mouths, spread out and open their pores to suck in food. A genial shower falls; dissolves the plant food newly made by the lime, and carries it to the myriad little mouths open and eager to receive it. The plants well supplied with food thrive, and show by their bright, deep verdure, and their strength and vigor, how well the lime is serving its purpose in the soil.

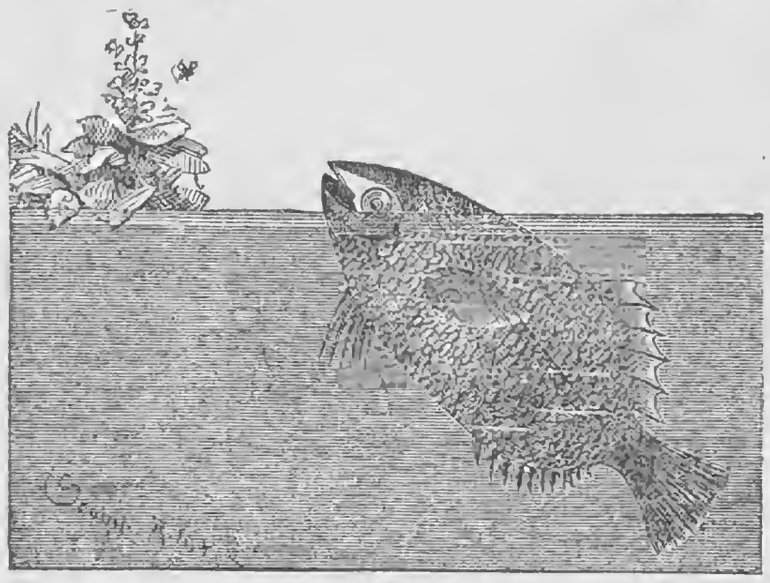
But it should not be forgotten that lime is itself a necessary plant food. In 1,000 pounds of clover there are 19 pounds of lime; in 1,000 pounds of corn stalks, 5½ pounds; in 1,000 pounds of tobacco, 73 pounds. There is much more lime than potash in wood ashes, and if it were not for the lime that exists in the grass a grazing animal could have no bones. So that while for this reason alone, it is necessary for the soil, yet its greatest value is derived from the chemical action upon organic matter, which has been explained, as well as upon a very similar action which it has upon some mineral matters, to be explained hereafter.

THE ARCHER FISH.

UNCLE MARK.

Probably almost all of the boys and girls, who will read this little sketch, have seen the common brook trout jump out of the water after flies and bugs. Having such a slender form and great muscular power, it can leap almost its whole length above the water to catch the unwary little fly which has ventured too near its unseen enemy. Indeed, a young friend of mine has a fine, pet trout which is kept in a tub, and he has to lay pieces of board across the tub to keep the spotted beauty from jumping out and becoming a meal for the cats. Sometimes a piece of meat is put on the end of a stick and held a foot or so above the surface of the water, but the trout likes no better fun than to jump up after it, and he scarce ever falls back without the dainty morsel.

But it is quite otherwise with the archer fish. Poor, clumsy, heavy-bodied fellow, he likes flies and bugs just as well as the sprightly trout, but he can't jump. That's quite out of the question with him, so he might often go without his breakfast or dinner had not the same wise Power who gave him the appetite, provided also means whereby it might be gratified. Yet he gets his



THE ARCHER FISH.—FIG. 175.

fly or his bug quite as often as the trout, and that, too, at a distance over which no trout could jump. The little fly which has just been sipping the sweets of the thyme or water lily, sails bravely homeward, so high above the water that, he thinks, no danger may be feared from a trout, however agile, but he does not mistrust another enemy. Perhaps it is the noise of his wings; perhaps it is the shadow of his body that attracts the attention of the little archer fish as he swims among the weeds and pebbles of the pond; but slowly the little hunter approaches the surface, and so directs his course that when his nose rises above the water, as we see him in the picture, he is at that point which is nearest to his game. Then, without warning, he shoots a little crystal bullet from his mouth—a drop of water—and down comes the fly. It has been said that this little archer is so sure of his game that he has been known to secure it at a distance of three feet, and triumphantly bear it away to his home among the pebbles. There are few, if any, specimens of this archer fish in this country, as his native place is in the fresh-water lakes of Japan.

LETTER FROM THE COUSINS.

UNCLE MARK:—As I have not written a letter before for the Cousin's department (not having been a member of the club), I thought I would send you a few lines, hoping they will prove interesting enough for publication. I am a farmer's boy living on a pleasant farm in the eastern part of Columbia County. I have three fine sheep which were given me by a neighbor when they were little lambs, and also a full-blooded Jersey calf, which I bought with my own money. My mother has some house plants, but during the very cold weather we have had they nearly all froze, at least the prettiest of them. The country about here abounds in foxes, and I can hear them barking almost any night. Hunters are out after them nearly every day, and they kill a great many. They can get from one to two dollars apiece for their skins. The weather now is quite mild, but we have had a very severe Winter. I shall be glad when Spring comes.

Canaan, Columbia Co., N. Y. PORTER DARROW.

DEAR UNCLE MARK:—I am a little girl and live at Prairie du Sac, Wisconsin; my step-father takes the RURAL. My mamma takes great delight in the flower and fruit department, and although she has very poor health she loves to cultivate flowers, as that is about all she is able to do. I thought, if you would allow me to become your little niece, that perhaps you would remember me in your seed distribution, so that I might help this Summer to make mamma's life pleasant and happy. I have grown up sisters and brother, also a little half sister that I love dearly. Her name is Flora Steele, we named her after the flowers, for my mamma worships flowers and her baby. DORA BROWN.

Prairie du Sac, Sauk Co., Wis.

DEAR UNCLE MARK:

If you please, I would like to join the Horticultural Club, as I am interested in Horticulture. I exhibited at our last fair 12 kinds of grain in the head, 20 kinds of grasses and 30 kinds of apples, and got the premiums on them. The specimens were all properly named, except the native grasses.

I am 13 years old and go to school and study reading, writing, spelling, geography, grammar and practical arithmetic. A. S. EMMONS.

Drowsiness, biliousness, pains and aches, and ague, Hop Bitters always cures.

Sabbath Reading.

THE UPWARD FLIGHT.

MRS. L. S. HAGNER.

ARE we almost there?
Have we scaled the height?
Are those the home-lights which gleam afar?
Have we bade farewell to the shadowy night,
And entered the realm of the morning star?

Faint to my ear come the sounds of earth,
The wailing of anguish and wild despair;
The hollow ring of her hollow mirth
Is lost in the depths of this upper air:

And now a breath like the breath of morn,
A light—a radiance, spreads around,
And forms of that mystic radiance born
Seem floating hither, glory crowned!

Oh angel! lend thy sheltering wing,
I see the portals of light unrolled,
With songs of welcome their arches ring,
The ransomed are safe in the Heavenly fold.

PIETY.

THE touchstone of piety is love to God. "The greatest of all the commandments is this, Thou shalt love the Lord thy God with all thy heart, with all thy soul, and with all thy mind, and with all thy strength." To a good man, God, though unseen, is a distinct personality, a being whom he loves. And it is no exaggeration for a man whose heart is all on flame with devotion to look up to the Great Presence and say, "Whom have I in heaven but Thee? and there is none upon earth that I desire beside Thee," the dearest ones, both on earth and in heaven, though dearly beloved and desired, being lost sight of in the absorbing contemplation of Him whose love, shed abroad in the heart, commands its supremest affection and its warmest delight.

But it is not every one who can say this directly he begins to serve God, nor even after he has made some way in the Christian life. The Divine life in the soul is a growth. The way of a Christian is a "Pilgrim's Progress;" if a Christian is standing still in the way he is losing his religion. If a godly man is not becoming better, he is almost certainly becoming worse. But if the glow of devotion is more fervid, and love to the Great Father is becoming more intense, the man is surely advancing in the life of the soul. The warmth and fervor of devotion to God are therefore the measurement of the soul's progress in godliness. Here, then, is the milestone by which to mark the soul's advance: can I say, "Whom have I in heaven but Thee?" If so, I am making way in my religion.

A FULL CUP.

WHEN the saintly Payson was dying, he exclaimed, "I long to hand a full cup of happiness to every human being." This was the language of a heart thoroughly purged of all selfish affection and filled with the spirit of that love, which led our adorable Jesus to give his life for human redemption. If every Christian would go out daily among men, filled with such longing for human happiness, what marvelous changes would soon be wrought in human society! The selfish element would be eliminated from the dealings of the Christian business man. Not justice merely, but benevolence, would enter into his every-day trade. The same spirit would rule his home and church life. He would become an incarnation of good-will toward all, and would so preach the Gospel by his deeds that man would see his good works; and glorify his Heavenly Father. The spirit of Payson is worthy of every man's imitation. Happy he who can truthfully say, "I long to hand a cup of happiness to every human being."—Zion's Herald.

How natural and how beautiful was that old Greek idea which gave a graceful spirit to each stately whispering tree, and held it an act of piety to plant a sapling where the felled trunk had stood, lest the pretty dryad should go homeless on the wold.

"But ah! my friend, the days were brief
Whereof the poets talk:
When that, which breathes within the leaf,
Could slip its bark and walk."

For trees and leaves do, really, breath. They seem, also, to toss their arms and sway, and bend towards each other, as though there were an earnest language in their murmurous sound, which cannot shape itself into words.

THE stars grow brighter as the night darkens. As the lights of earth are put out one by one, the countenance of heaven makes plainer revelation. Grace makes a very sunset of what to nature is the most impenetrable darkness, and the plaintive strains of the Miserere merge in spite of humility into songs of triumph; for the walls between the dying soul and the heavenly Jerusalem are so nearly fretted through that the loud Alleluias mingle with the contrite love whose eyes are closing on the cross. Precious in the sight of the Lord is the death of His saints.—F. W. Faber.

Now, I say the times are full of promise. I look over the earth, and nearly everything is hopeful. Christianity is growing stronger. To-day there are more Bibles, more Sunday-school children, more teachers, more spiritual songs, more sermons, than there ever were on any Sabbath since the light of the sun dawned on the Garden of Eden.—Bishop Simpson.

WHILE we are looking at unseen and eternal things, Christ, Christ only, is our sole foundation. He will be with us through the Valley. He will receive us when it is passed through. He will present us faultless to the Father. His blood, His righteousness, His spirit His image—these are the glorious dress He gives. Let us, day by day, put on Christ; so shall we be found clothed with the garments of salvation.—Bickersteth.

PERSONAL ITEMS.

Senator-elect Mitchell of Pennsylvania, wears a chin whisker in the California style.

Frances E. Willard this week presented Mrs. Hayes's portrait, secured by the temperance women as a testimonial to her temperance principles, to President Garfield, and it was hung in the White House next to Martha Washington's.

Whitelaw Reid, editor of the N. Y. Tribune, is said to be actually engaged to the daughter of D. O. Mills, the California banker, estimated to be worth anywhere from $10,000,000 to $25,000,000. These gossips report that the marriage is to take place early in April, and that the bridal trip will be an extensive tour on the Continent.

The train bearing ex President Hayes and his party from Washington, and going at full speed, collided Saturday afternoon with two engines and a train of empty cars near Severn station on the Baltimore and Potomac railroad, 15 miles from Baltimore Two men were killed and several injured. None of the Hayes party, who were in the last car of their train, received more than slight bruises.

[Worcester (Mass.) Spy]

Nothing on Earth so Good.

Certainly a strong opinion, said one of our reporters to whom the following was detailed by Mr. Henry Kaschop, with Mr. Geo E Miller, 418 Main St., this city; "I suffered so badly with rheumatism in my leg last winter, that I was unable to attend to my work, being completely helpless. I heard of St Jacobs Oil and bought a bottle, after using which I felt greatly relieved. With the use of the second bottle I was completely cured In my estimation there is nothing on earth so good for rheumatism as St. Jacobs Oil. It acts like a charm."

Real Estate.

NORTHERN TEXAS

Offers greater attractions in way of good, cheap lands, healthy country, mild climate, abundance of timber and water than any other section now open to settlement. In it the TEXAS AND PACIFIC RAILWAY is now being extended westward over one mile per day, and is now offering for sale at low prices and on easy terms over 4,000,000 acres of land.

For descriptive circulars and maps giving truthful information, address W. H. ABRAMS,
Land Commissioner T. & P. Ry., Marshall, Texas.

LANDS AND HOMES

Short winters, low taxes, good society, convenient markets, superior schools, healthful climate. Excellent for Stock, Fruit, and Farming. The best Tobacco Region in the West. 1,000,000 acres well watered Timber and Prairie Lands along the line of the St. Louis and San Francisco R. R. for sale at from $2.50 to $8 per acre on seven years' time. Free transportation from St. Louis to purchasers of land. Send for maps and circulars.

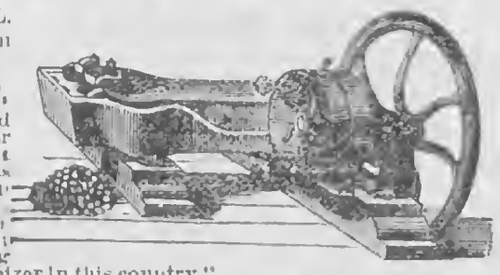
CHEAPEST AND BEST FERTILIZER.---FOLLOW NATURE.

WHICH USES GROUND LIMESTONE IN MAKING SOIL.

Every Farmer can prepare his own FERTILIZER with an ORDINARY HORSE POWER by using

Forster's Combined Crusher & Pulverizer.



Crushes and grinds Limestone at one operation. Ground Raw Limestone has been used as a Fertilizer in Germany for 50 years, and found to be three times as valuable as Burnt Lime. With above Machine, it does not cost as much as Burnt Lime.—W. W. REED, of Erie, Pa., says: "The GROUND LIMESTONE proved to be the most economical Fertilizer showing a profit over Bone Dust of $1.96 per Acre; over Phosphate of $1.28 per acre; over Guano of $9.70 per Acre; and over Salts of $5.95 per Acre."—JOHN G. BEAR, Montgomery, Lycoming Co., Pa., says:—"I believe it to be the *cheapest* and *best* Fertilizer in this country."

ESPECIALLY VALUABLE FOR SPRING CROPS, CORN, etc. Machine is exceedingly simple and not liable to get out of order. Address TOTTEN & CO., Pittsburgh, Pa. ☞ ONLY MAKERS.

STOCKBRIDGE
MANURES
SEND FOR PAMPHLET.

These manures are the richest fertilizers now manufactured, and the best substitute for, and costing *much less* than guano, which is now practically out of the market. Unlike guano, they *are not stimulants* and *exhaustive*, but *permanent* and *lasting*, being composed of bone, potash, etc. You can draw at one load enough for 3 to 5 acres, or as much plant-food as is contained in 20 loads of ordinary straw manure. Corn, potatoes, hay, etc., are bringing such good prices that it will pay to use the Stockbridge extensively. If there is no local agent near you, send to us

Humorous.

"You don't know how glad I am to see you, Clara, dear." "Oh, yes I do," replied Clara dear; "Johnny told me that he heard you say you would rather die than see me."

MOTHER: "Now, Gerty, be a good girl, and give Aunt Julia a kiss and say good night."—Gerty: "No, no! if I kiss her she'll box my ears, like she did papa's last night."

"SHET dat do', Sam." "Why, it ain't cold, marm." "Golly, you shet dat do' you brat; ob course it ain't cold, it's me dat's cold. Tink I care wedder de do's cole or not!"

NEW style pocket handkerchiefs have the day of the week embroidered on them. This is to prevent a lazy man from carrying the same handkerchief the week through.

"MRS. BROWN, I do wish you would try to bring David out a little. Why, do you know he's so bashful that I really think if he caught the measles they wouldn't come out."

PECK'S Sun has been looking up the millinery business, and it finds that thirty cents' worth of velvet, three cents' worth of wire and forty cents' worth of feathers can be stirred up and sold for $25.

"KISS," said young Charles, "is a noun, we allow; but tell me, my dear, is it proper or common?" Lovely Mary blushed deep and exclaimed: "Why I vow, I think that a kiss is both proper and common."

A YOUNG lady was caressing a pretty spaniel and murmuring: "I do love a nice dog!" "Ah?" sighed a dandy standing near, "I would I were a dog." "Never mind," retorted the young lady sharply, "you'll grow."

TEACHER—"John, what are your boots made of?" Boy—"Of leather." "Where does the leather come from?" "From the hide of the ox." "What animal, therefore, supplies you with boots and gives you meat to eat?" "My father."—Galveston News.

A GENTLEMAN from Indiana recently registered at an Illinois hotel and looked at the printed notice in his bedroom, "Please do not blow out the gas." The occupant of the adjoining room heard him remark, "I pay my money, and I am going to blow out the gas if I want to."

Something the Tourist Needs.

The tourist and the commercial traveler who visits foreign lands, or regions of his own country where vicissitudes of climate are among the influences prejudicial to health, omits a necessary precaution if he takes with him no medicinal safeguard against illness. The most reliable, if due credit be given to the statement of travelers, mariners, and emigrants who have used it, is Hostetter's Stomach Bitters, a sovereign protective against malarial and ship fever, and disorders of the stomach, liver and bowels, to which persons in transitu from one country to another, in the Tropics, and emigrants to the far West are peculiarly subject. The highly accredited medicine nullifies bad atmospheric influences, the effects of impure water, and inures the constitution to changes of temperature and an unaccustomed climate. Hardship and fatigue are endured with less danger or evil consequences if the system is fortified with this incomparable tonic and nervine.

CHOICE SEEDS! BEST OFFER YET.

The New Sheep Dip!
LITTLE'S CHEMICAL FLUID.
Non-Poisonous, Non-corrosive Disinfectant, and Specific for Scab and Mange, and any skin disease, Ticks, Lice and all insect pests. Worms in the throat and other internal parasites in Sheep and Lambs. Also a Certain Cure of Sore Eyes in Sheep and Lambs.
Is now extensively used in all the great wool-growing countries of the world, and is rapidly superseding all other preparations. In Australia it is the recognized Dip, and in New Zealand it is used in the Government Dipping Stations, and is highly recommended by the principal Sheep Inspectors. In the United States also, although only recently introduced, it is having a large sale, especially in California, and during the last 12 months many thousand gallons have been shipped to that State alone. A large demand has arisen from one end of the country to another, from parties who have satisfied themselves of its merits.
It is before all other Dips in the simplicity of its preparation. It mixes at once with **cold** water, and a single trial will prove that on coming into contact with the water the whole is changed into a milk-white Dip, which is **distinctly not the case with any other material.** May be used in the coldest weather with perfect safety.
Send 3-cent stamp for Testimonials and prices to

Situation as Gardener Wanted.

A young married man, having six years experience desires permanent employment as Gardener. Understands care and cultivation of lawns and all hardy shrubs, trees, flowers and vegetables. Also understands horses. Six years in last situation. Best references given, among them, Editor of "Rural New-Yorker." Address HENRY RANDALL,
River Edge, Bergen Co., N. J.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

THE RURAL NEW-YORKER

Ralph Evans

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XL. No. 13. WHOLE No. 1626. | NEW YORK, MARCH 26, 1881. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Floricultural.

A STUDY IN ORNAMENTAL GARDENING.

PETER B. MEAD.

WE are running so much to "bedding" and "ribboning" in these days that there is a real danger in the near future of many forgetting that there is any other method of adorning the lawn or the garden, and there would, therefore, seem to be a necessity for occasionally presenting examples of other styles, better fitted to the means and surroundings of most American homes. I do not propose just now, however, to discuss the merits or demerits of any particular style of gardening.

The accompanying illustration is presented not only as an example of excellent taste, but also as a *study*. It is one of those things that will adapt itself to a great many places. I doubt whether any man, woman, or even child, can look at it without being impressed with its quiet, yet expressive beauty. It is simple, but very suggestive. How much more charming to see the plants so disposed as to develop their individuality, rather than that want of arrangement in which all individuality is lost in a crowded mass of color. In the former case we have beauty of form as well as color; in the latter, color alone. To this may be added that the illustration is susceptible of many variations from year to year at a very small cost, which is a point of much importance to those of moderate means.

But let us examine the picture, and see what it is. On the left we have a corner of the dwelling, showing a window prettily flanked on one side by a clematis, and on the other by a climbing rose. A modest little greenhouse is a fit companion, and in good taste. The walks are spacious, as they always should be where the grounds will admit of it, as they are convenient and conducive to comfort and enjoyment, as well as expressive of the largeness of the owner's heart, (sometimes of his purse) The vase at the sharp angle of the lawn is in the right place, and produces a good effect; and, what is better still, it has only a single plant in it. The oval bed is in a good position, and may be seen equally well from either walk. Through the center of this bed are three standard roses. Outside of these a row of Japan Lilies and gladioli, alternated, produce a good effect, which is enhanced by herbaceous plants between each. A border of variegated alyssum makes a neat finish to the whole.

A GARDEN SCENE.—Fig. 176.

In the border in the middle ground on the right, we have a row of hollyhocks alternated with Japan Lilies, and between each a Scarlet Pelargonium. For a background to these there is a mass of shrubbery with an irregular or broken outline, and some large trees in the distance. On the left, in the foreground, is a fine specimen of the Castor Oil Bean with its imposing ornamental foliage. Beneath the window, and commanding a view of the whole, is a rustic seat, where the family and friends may sit on a quiet eve, and enjoy the companionship of the birds and those other charming but voiceless children of Nature. Just at the moment we are looking at the picture the lady of the house has come out to gather a few flowers for the dinner table, and her little boy is eagerly pulling her by the hand to show her where to find the prettiest and the sweetest flowers. Who, that has ever been a boy, cannot remember something just like this?

I have said that this picture is presented partly as a *study*; by which I mean that many of the plants in the oval bed and in the border may be changed every year, if deemed necessary, without impairing the effect, and securing more variety than by massing, and at much less expense, as the principal plants are hardy and permanent ones. I will suggest a few changes by way of example, and leave the reader to make others, holding myself ready at any time to make any suggestions that may be needed. For example, remove the middle standard rose, and put in its place a Hydrangea paniculata grandiflora with a single stem five or six feet high. The top or head will need to be annually pruned to keep it in good shape and prevent it from getting too large. The lilies should not be often disturbed. Clumps of tigridias may take the place of the gladioli. Between the lilies and the tigridias put a plant of scarlet pelargonium one year, coleus the next, and so on. The border may one year be variegated alyssum, the next blue Lobelia, etc. The vase may one year have a Lomaria, the next a Sago Palm or a pritchardia. There are many annuals that may also be used with good effect.

In this way a pleasing variety of changes may be made every year. In the places not occupied by the plants above named may be dotted, all over the bed, clumps of snowdrops, scillas, triteleias, tulips, hyacinths, etc, for early Spring flowers, and these may be succeeded by Sweet Alyssum, mignonette, and other low-growing annuals.

I now turn the picture over to the readers of the RURAL, confident that they will find much pleasure in its study, even though they may have no plot of ground to which to transfer it.

THE PRETTY PRIMROSES.

WE have had so much pleasure and enjoyment during the past severe Winter from a few pots of Chinese Primroses (Primula Sinensis fimbriata) in our sunny window, that I felt like telling all who have never tried it how easy it is to grow them in the house successfully. Only four small three or four-inch pots have filled our window with a blaze of beauty ever since Thanksgiving Day, and more florliferous little creatures of the vegetable kingdom I never beheld. A hundred separate flowers could be counted upon the little plants at almost any time, and there is very little sign of abatement even yet; new buds continue to expand daily. The flowers are single, some pink, others white. The fragrance is delicate and delightfully fresh, reminding one of the leafy woods in June. The foliage is in itself almost as pretty as the flowers. The ferny green leaves in the colored varieties are shaded with maroon on the under side, and borne on stems of a similar color.

But the florists and amateur window gardeners will say, "Fudge! he's got the old natural single species of this well known plant, such as may be found growing wild in many parts of Europe; and what's the use of going off into ecstacies about that, when so many choice strains of double sorts are to be had at almost any greenhouse." Precisely, and this is a remark I may as well answer in advance. The new and choice varieties are certainly very beautiful, but they are also very uncertain, sportive, unreliable and tender and often indifferent bloomers at best. The late magnificent strains offered by many English growers at almost fabulous prices are indeed most tempting to any lover of flowers, both in colored representation and the glowing descriptions sent out. An exquisite colored plate in the London Garden last year almost tempted me to a small importation of the little beauties even at those high prices. But the risk of loss seemed too great; and I have since learned that the plants sent out proved sportive and unreliable in many cases, and experience with the double white which has long been common here has proven that its constitution has suffered by the florists' efforts to produce double flowers. And yet I would not ask any one to entirely discard the double varieties from his collection. I only plead for a place on every shelf for a few plants of the single sorts, and promise an abundance of pretty bloom in every case.

My plants were raised from seed said to have been collected from the finest strains of double sorts in England. But I obtained no double flowers; nor need any expect to do so in similar cases except by the merest chance. The only sure way of obtaining such is to buy plants of a reliable grower. The seeds are very small and require careful treatment to germinate; but once started the plants progress steadily, and soon become strong enough to bloom. The cultural directions found in first-class catalogues will lead to success if carefully followed. When old enough the plants will bloom in spite of your teeth, and in almost any location; and I really know of no other flowering plant on the whole list that will bloom so profusely in a sunny window in Winter, or give so much pleasure for so little care and pains Remember its leaves are averse to direct contact with water; apply it to the soil carefully. Give the plants rest in a shaded border in Summer if you can prevail upon them to take it. Do not overpot them, but change into larger pots when the roots ask for more room.

H. HENDRICKS.

CROCUSES are now (21st) blooming in sheltered places of the Rural Grounds. The yellows are always the first to bloom—the white next. The leaves of hyacinths and tulips are just beginning to show themselves.

Horticultural.

RURALISMS.

THE best method of keeping fruit is just now receiving a good deal of attention, both at home and abroad. The subject is one of great importance, and deserves all the attention it is likely to get. There are two quite opposite views advanced, both here and in Europe, and it would seem, quite independently of each other. One might be called the "wet" method and the other the "dry" method. I would suggest to those interested in the controversy (as all of us are, of course.) that it will greatly help to a solution of the question if it be borne in mind that all kinds of fruit will not keep equally well under the same conditions. At a future time I will contribute something to the "dry" side; just now, however, I will add a couple of items to the "wet" side.

Many years ago I had a box of Beefsteak Geranium (Saxifraga sarmentosa), which I directed to be left out, and it was placed under one of the grape-vines. In November I happened to see it, brushed aside the leaves, and found a bunch of grapes almost completely buried in the soil which had been thoroughly riddled with earth-worms. The box was then taken to the cellar and the earth kept moist. In the following March I attended a stated meeting of the trustees and faculty of the University of New York. It was usual at that time to have a little supper or lunch after the meeting, and that bunch of grapes was placed on the table in sound condition, and pronounced to be good by such men as Pro-

fessor John W. Draper, Luther Bradish, Professor Gardiner and others, all of whom, except the first, have passed away. I have since then many times preserved bunches of grapes suspended in pots of sand or charcoal powder, the bunches inverted generally, and the sand or charcoal kept moist, but not soddened. This is only a hint.

Again, last Summer bushels of apples were blown from the trees by the great gale of wind which all will remember, and some of these fell on a piece of ground which had just been dug over and on which boards were placed for a walk. Some early Summer apples got under one of these boards and were pressed into the soft soil by repeated treading. In October this board was lifted and the apples then discovered. They were in a perfectly sound condition. I simply state the facts, and leave others to make the comments.

The Epiphyllum truncatum and its varieties bid fair to become popular plants for Winter blooming in rooms, and they are worthy of being a good deal more popular than they are in the greenhouse. The inquiries of the lady of St. Louis have been followed by others. I have heretofore stated that my plants began blooming in November, and now (March 5) the last flowers are just fading. It is not meant, of course, that one plant or one variety has been in flower all this time, but a collection of varieties, which, with a little management, will give a succession of bloom daily during the period above mentioned. There is not a dwelling in the whole country that has not at least one window where a few of these plants will grow well and bloom profusely, and with as little trouble as any plant that grows. And then they look so gay and cheerful. They must receive treatment, however, a little different from that generally recommended to insure this succession of bloom. In the room I have them suspended, and in the greenhouse set on brackets, and either way they are beautiful.

There are many who take pleasure in ornamenting, or rather adorning, the home, who are unconscious of the beautiful and inexpensive material that is always at hand to those who live in the country or the suburbs of a city. I was much pleased recently, on making an evening call at a neighbor's, to see the reception-room beautifully adorned with a rush very common in marshy places and commonly called Cat's Tail (Typha latifolia). I had never thought of it as an ornamental plant before, though I can never see it without going back along the path of time to a period when there was no Fourth of July to a boy without a bundle of Cat's Tail—now, alas! robbed of all its poetry by "punk" and other vulgar inventions. The rushes had been cut pretty close to the ground, and placed against the wall all around the room, the butts resting on the floor. The effect was not only pleasing, but exceedingly picturesque. The young ladies who arranged them had the good sense and good taste not to cut them all of the same length, but to use them just as they came from the meadow, and this not only avoided stiffness and monotony, but secured a charming naturalness and variety. In addition to the rushes, vases were tastefully filled with native grasses mixed with the eulalia and erianthus. The effect of the whole was delightful; and as I threw myself on the lounge, involuntarily I found myself humming the pretty and plaintive old song, "Green grow the rushes, O!" I commend the example of these young ladies to others. There is no part of the country that will not afford similar material for making home pleasant during the Winter.

HORTICOLA.

Small Fruits in Kansas.—In spite of a very severe Winter grapes are all right. Blackberries are badly damaged, and so are strawberries, except where well mulched. Of raspberries, the Mammoth Cluster has stood the Winter about as well as usual. So has my Cuthbert without any protection whatever, and the ground has been free from weeds. I left them in this condition in order to test their hardiness thoroughly, and must say that I am well pleased with them. During the last ten years, I have tested most of the leading varieties of promise, and have discarded all but Mammoth Cluster. It is the berry for this climate. I can raise them, any ordinary season, measuring three-fourths of an inch in diameter. To the incredulous I will say that I have even beaten that; and although I have never tried the Gregg, I will pay a liberal premium for any Greggs that will beat my Mammoth Clusters in size. I shall plant both Gregg and Turner this Spring. A. B. D.

Edgerton, Kan.

NOTES FROM THE RURAL GROUNDS.

How to Treat the Seeds of the Free Distribution of the Rural New-Yorker.

White Elephant Potato.—We would advise to cut the potato so that there shall be but one eye to a piece and so that each eye shall have as much flesh as possible. These pieces we should plant in rich, loamy soil not less than one foot apart. In case of threatened dry weather, a mulch of leaves, straw or manure would be found serviceable.

Washington Oats.—These had better be sown thinly in drills of prepared soil. Each plant should have plenty of room so as to tiller and to produce the best yield.

The Rural Branching Sorghum.—The R. N.-Y., contrary to its wont, has praised this sorghum almost unqualifiedly as a fodder plant. And our faith is as strong now as at any previous time. We have tested it for three years and the results have been such that we prefer it to any other forage plant which we have ever seen or tried. The early growth of the Branching Sorghum is disheartening. All who try it would, if not cautioned to suspend judgment, consider it a failure one month after it appears above the ground. It then gives no promise of the splendid growth which shortly thereafter takes place. When it attains the hight of five feet, and a half-dozen or more leafy stalks are cut from each seed and every stalk continues to grow as if no interruption had occurred, its real value begins to break upon the cultivator.

It is of the first importance that the prepared plot be free and be kept free of weeds. If otherwise, those unfamiliar with its slow germination and its resemblance to grass, would probably be unable to distinguish the rows. Prepare the soil as for corn—the *mellower* the better. Sow the seeds from one inch to one foot apart in drills four feet apart. Press the soil over the seeds and cover half an inch deep. If sown but one inch apart, the plants at the first hoeing should be thinned out so as to stand not *less* than 18 inches apart. This thick sowing would thus insure an even stand, but where, as in the present case, it is desirable to raise as many plants as possible, the seed supply being very limited, six inches apart might be better, in which case it would be necessary to destroy fewer young plants. Another method is to plant four seeds in a place—a *flat* hill, if the expression is allowable—these hills to be two feet apart, all but one plant to be destroyed at the first cultivation. We advise our friends not to sow before *late May* or even June 1st for this climate. If in late Summer those who raise this sorghum will make the trial of placing equal quantities of this and corn stalks and leaves before their horses or cattle, they will ascertain that the sorghum will be eaten first. For ensilaging purposes we should suppose it would prove far more valuable than corn, while we are in hopes that the sorghum industry may find in this a rival of the several canes now employed for the production of sirup and sugar.

The Argenteuil Asparagus.—Our friends are advised to prepare small plots for this asparagus thoroughly. Select a rich, loamy soil if possible. If not, make it rich by the addition of well-rotted manure. Work it over several times with hoe and spade. Sow the seeds six inches apart in the drills—the drills 12 inches apart. Compact the soil over the seeds and leave the surface smooth and mellow. Let it be borne in mind that asparagus seeds are often *slow* to germinate—requiring sometimes a month or more. Attend to this seed-bed—Keep it free from weeds and the plants may next Spring be set in their permanent beds and cuttings for the table be made the year after.

Giant Dutch Purple Asparagus.—Same instructions in every respect as for the French Argenteuil.

Picotees, Carnations and Chinese Pinks.—These may be sown, as soon as received, in boxes, pans or flower pots. It does not matter so long as a thorough drainage is provided for. Use for this purpose plenty of broken flower pots—or bits of charcoal, or even pebbles or small stones will answer. Fill with rich fibrous soil, such as that from decayed sods, and add a liberal proportion of sand. Mix *thoroughly*. Sow the seeds at least an inch apart (two inches would be better); compact the soil by pressing the bottom of a flower pot upon it and cover to the depth of an eighth of an inch. Again press the soil—but gently and evenly. Place in a temperature as uniform as possible; avoid *hot* sunshine, and cover with panes or pieces of glass. Later these seeds may be sown in the open ground. In this case we would advise sowing in pots or boxes, as above explained, and plunging them in the ground until the rim of the pot is on a level with the surrounding soil, using glass to cover as before. Again, the seeds may be sown in late May in a well prepared, out-of-door border where the plants are to grow. In this case the percentage of loss, of course, will be greater.

We may be excused for insisting that the seeds of this present seed-distribution are worthy of especial care. They are, in so far as we may judge, the best of their kinds. The White Elephant, we believe, will prove as a late potato all that the Beauty of Hebron (previously sent out by the R. N.-Y.) has proven as an early potato. It is now offered for sale but cannot be purchased for less than one dollar per pound. The Rural Branching Sorghum, whatever it may prove in different climates and soils, has cost us $25 per hundred pounds. The asparagus seeds have cost us to import $175 per hundred pounds. The picotees and carnations have cost us to import from $10 per pound (the lowest) to $150 per pound (the highest). In making these distributions it is, as has often been stated before, no part of our plan to offer the seeds in large quantities. Our object is merely to introduce new plants for the farm and garden which (without cost to our readers) give the best promise of proving superior to well-known kinds; and we may call attention to our previous distributions to show that thus far we have been as successful as could reasonably have been expected.

If half of our new native grapes turn out half as good as they promise to do, the miserable Malaga Grape now sold everywhere in such immense quantities should soon become a fruit of the past.

Pomological.

EXTRA-HARDY APPLES.

T. H. HOSKINS, M.D.

The list of extra-hardy apples given on page 802 of the Rural of December 4, in which the Messrs. Chase, of Geneva, mention 15 varieties as being "as hardy as the Duchess of Oldenburgh," contains many which are far from being as hardy as that variety in Northwestern Vermont. Differences in hardiness that would not be noted in more favorable localities are very conspicuous here. The Tetofsky is as hardy as the Duchess, but Alexander, though a "Russian," is not. It must take its place considerably lower, alongside of Red Astrachan and St. Lawrence. Though hardy, Tetofsky is of little value as an orchard apple, on account of its habit of dropping nearly all its fruit before ripening. The Yellow Transparent is equally hardy, a little earlier, of much better quality, and does not drop. It is not quite so large as Tetofsky, but is of good, even, merchantable size, ranking with Early Harvest. The Tetofsky was dropped from the list of the Iowa Horticultural Society at its meeting of December 4, 1879, and the Yellow Transparent favorably reported on.

The "Peach," if by this name is meant the "*Pomme Peche*," or Peach of Montreal, ranks very near the Duchess of Oldenburgh in hardiness, and is better in quality, but not nearly so valuable as a market apple, being much more easily defaced in handling. This variety is not in "the books," and must not be confounded with various others bearing the same name. Its season is with the Duchess,—the first half of September, here.

Aucubafolia, instead of being very hardy, is a quite tender variety, long ago rejected here and in the Northwest on that account. It is a nice apple where it can be grown. The genuine may be easily known by its leaves being spotted with white, for which peculiarity the name was given—I have reason to think other sorts have been distributed under that name.

Clark's Orange I do not know. If it is the Fall Orange, or Holden Pippin, it is neither hardy nor profitable in very cold localities.

Plumb's Cider is hardy, and a good late Fall variety. It has not proved productive with me on trees 12 years planted.

Wealthy is the king of "iron-clad" early Winter apples, sometimes keeping well until April. If always reliable as a keeper, it would be preferable to the Baldwin anywhere, being equal in size and productiveness, finer in color, and better in quality.

Bethel (known in St. Lawrence Co., N. Y., under the name of the Stone Apple, having been carried there from Bethel, Vt., by a man of that name), is the equal of the Wealthy in size and quality, and a far better keeper. It is a free bearer in rich valley land, but rather shy on the hills, except in favored spots. It is about equal with Alexander and St. Lawrence in hardiness. The Messrs. Chase give it as keeping only as long as Wealthy, which is a great mistake. It keeps fully as well as the Baldwin.

Haas, or Gros Pomier, is hardy, productive and of fair size. It is very popular at the Northwest; but, so far, in the East it has been found quite poor in quality. It is a late Fall variety, and not a good keeper. The Messrs. Chase err greatly in giving its season as "December to March."

"Rubicon" (which is a synonym for the Pawpaw, or Western Baldwin of Michigan), is not very hardy, and so far is not regarded as valuable in this vicinity. The Michigan Horticultural Society say of it "must have suitable soil and good culture." This makes it a garden apple, likely to fail in ordinary orchard culture, which quite agrees with experience here.

McIntosh Red is a new variety, resembling the Fameuse in appearance and flavor, but generally larger. Specimens of the same size as Fameuse cannot be distinguished from that variety, but the tree is quite distinct, and so far, with me, seems hardier—I doubt its keeping much longer than the Fameuse.

Pewaukee, though a seedling of Duchess, is very inferior to it in hardiness. It kills badly here, and I burned a large number of three-year-old trees last Spring, as unfit to sell. I regret this, as it was a promising, and if hardy, would have been a valuable sort. It is less hardy than Fameuse.

The Quince, if either the "Quince," or "Cole's Quince" of the books, is not a Winter apple—See Downing. Cole's Quince is about as hardy as St. Lawrence. I annex a list of

Genuine "Iron-clad"

varieties, as tested in my grounds during the past 14 years, that are all productive, good and profitable.

Yellow Transparent	August.
Duchess of Oldenburgh	September.
Peach of Montreal	September.
Pringle Sweet	September.
Switzer	October.
Prollfic Sweeting	October.
Riabinouka	November.
Wealthy	December to March.
Magog Red Streak	December to May.
St. Johnsbury Sweet	Dec'b'r. to February.
Newport Sweet	December to May.
Scott's Winter	February to July.

All of the above-named varieties, except Switzer and the three last-named sweets, have been illustrated and described during the last two years in the Rural. Switzer is one of the new Russians, closely resembling Red Astrachan in size, form and color, but later in season and much superior as a dessert fruit. Prolific Sweeting is also one of the new Russians, large, roundish-oblate in form, good for cooking or eating out of the hand. The St. Johnsbury and Newport Sweets are good baking apples, and the former a fair eating fruit. Both are of good size, the St. Johnsbury beautifully striped with red, the Newport something like the Talman, but flatter. I hope to forward specimens of all these to the Rural, during the coming year.

Orleans Co., Vt.

MORE ABOUT PEACHES.

T. T. LYON.

Variegated Free is a name that came to us with trees imported from Pennsylvania. I fail to find the name in any of our recent works on fruit, or even in the catalogues of nurserymen. It may very possibly prove to be an old variety sailing under a pseudonym. Whether old or new, it proves here to be an exceedingly beautiful, pale-fleshed, purplish-red peach, tender and delicate in texture, very juicy, mild, but rich in flavor, ripening this season from the 20th to the 30th of September. Productive.

Richmond, which with Atlanta, is a seedling of the late Dr. Sylvester, of Lyons, N. Y., is characterized by W. C. Barry as unsatisfactory in Western New York. Both are highly successful here; Richmond taking high rank as a market peach in defiance of the competition of Early Crawford of nearly the same season, and Atlanta vindicating its claim as a prominent amateur variety on account of its fine appearance and high quality. Both are apparently growing in estimation among planters.

Crawford's Late has a fine reputation here as a market peach on strong soils, and has been extensively planted within the last three or four years. I fancy, however, that the popular verdict would be that it is only good to sell—not good enough to be grown for home use as compared with many others of the same season. In fact, my advice to all except market planters, would be to let it severely alone. There are dozens of better sorts, any one of which would more than fill its place for this purpose.

Hill's Chili (with a very long array of synonyms) seems to have taken a prominent position among commercial planters here on account of its hardiness and fine shipping qualities. Experienced and discriminating planters have long since condemned it for lack of quality, unattractive appearance and deficient size, unless thoroughly thinned. Its popularity is rapidly waning. Indeed, it seems surprising that it has so long stood in the way of more desirable and, elsewhere, more popular varieties.

Keyport White—a variety whose origin I have not been able to trace—has had a place in our lists since the early days of peach planting in the Michigan "fruit belt;" but it seems never to have been extensively planted, although a better, and especially on light soils, a more productive peach than Late Crawford. Had its originator been imbued with some of our modern ideas and succeeded in infusing into it a little of the aureate coloring, so temptingly commended to the dairymen of today, it would, very possibly, have taken a much higher place in the estimation of planters. Its entire freedom from color at the pit and its late ripening, conspire to render it de-

sirable, especially for preserving and canning. Season, end of September.

Late Red Rareripe, although long since recognized as one of the most excellent of peaches, and by no means snperseded in this respect by any of the more modern introductions, has apparently been almost forgotten by planters, in obedience to the behests of the commercial idea. Planters of family orchards might do very much worse than to fall back upon this worthy old favorite.

Stump the World is considerably planted here to follow the still popular Old Mixon Free—a purpose for which it is available on account of its fine size and showy appearance, although it cannot be commended for high quality. Season, near the end of September.

Tippecanoe Cling seems, with us, to acquire the high quality for which it is noted in Eastern Pennsylvania. It ripens fully within our ordinary seasons, and is, we think, one of the finest flavored of all our very late yellow peaches. Were it not a cling it would doubtless at once become a general favorite.

Heath Cling is one of the finest and most profitable when it fully ripens, which it will do here about the middle of October, but occasionally our seasons do not suffice for this purpose.

Smock Free may be said to be the latest reliable freestone, market peach for the "fruit belt." Within the past three or four years, I think it can be safely assnmed that, south of the Kalamazoo River, the planting of commercial orchards has been more extensively of this than of any other single, late variety.

Delaware White. We have a bright-looking, large, creamy-white peach occasionally planted in this region under this name. Very little seems to be known as to its origin, nor is it highly esteemed as compared with others of its season, which is very late—about the beginning of October. It is of only moderately good quality, but is a good culinary fruit, and with an infusion of "patent color" would very probably have become popular.

DOCTORS CONTINUE TO DISAGREE.

The extremely cold weather which prevailed over a very large area during the latter part of December last, has given rise to much speculation and discussion among the fruit growers in different sections of the country. The New York Tribune, in an article headed "Frost on the Peach Trees," gives the opinions and theories of Mr. Samnel Townsend, of Delaware, on several points connected with this snbject, that are not exactly in harmony with the conclnsions of the horticultural editor of the "Prairie Farmer." Delaware's veteran of the orchard says: "Zero is too cold for peaches, and 4° or 5° below for 24 hours will kill the fruit-bearing buds and the limbs they are on." Mr. Townsend, furthermore, declares: "There is no remedy for peach trees where the thermometer falls to from 8° to 15° below zero."

Now hear from the indomitable Illinois editor: "We have, for a long time, believed that a class of varieties may be obtained by careful selection of seedlings from the hardiest varieties in a few generations, that will prove hardy far north of the present limits of the "peach belt." * * We have by continued reproduction of hardy varieties from seed, obtained sorts that have withstood a reported general temperature of 26° below zero, both in tree and fruit bnd, and matured a crop of peaches the Autumn following; and we feel considerable confidence in picking peaches from one of these trees next Autumn, notwithstanding that the tree has been tried this Winter by 28° below zero."

It is plain that the gentlemen quoted above hold different views regarding the capabilities of the peach to withstand cold; but the fact, so common to all experienced growers, that there is a plainly noticeable difference in the hardiness of different kinds, would give the greater weight to the views of the editor. Mr. Townsend is at variance with another theory—one laid down by the scientific class of horticulturists—regarding the cause of the fatal disease among peach trees, commonly called "yellows." He maintains that extremely cold weather will cause this disease; that this is "one of the most fruitful" causes. In this, Delaware's gentleman of practice is at issue with the most profound scholars and acute observers belonging to the "craft." "A fungus that attacks and preys upon the roots," says the scientific, "is the cause of the yellows in the peach." That the disease is generally fatal is not debatable; but the reason for this fatality is found in the fact that it rarely occurs that the disease receives any treatment; hence it is not surprising that Mr. Townsend should be quoted as saying: "Never has there been known a single tree, which, when once so affected, was cured." To this my own personal experience with the disease in question, compels me to take exception, because I *know* of its having been permanently cured after it had so weakened the tree as to cause the fruit to color and soften weeks in advance of its proper season, the foliage to assume an enfeebled and abnormal color, the wiry and weak snckers to be thrown out along the heavier limbs, etc., etc. It was a case of veritable yellows, without doubt, cured through the agency of strong alkalies placed in contact with the roots. Here it will be noticed that experience goes once more against the views of the Delaware peach-grower, who by reputation is known by the writer to be a gentleman of long apprenticeship to the "art" of growing peaches for market. J. W. Kerr.

Carolina Co., Md.

Field Crops.

TOBACCO CULTURE.—NO. 4.

G. A. GOFF, JR.

Setting the Plants.

Tobacco setting commences here usually about June 1st. and continues during the month, as the weather allows. The plants are set immediately after a rain while the soil is saturated with water. Boys are usually employed for the work and are paid by the hour.

SHEEP'S FESCUE—FESTUCA OVINA.—FIG. 177.

One boy goes ahead and drops a plant in each mark made by the cleats on the roller, while others follow and set them. One boy can drop for two to set. Care should be exercised to have the roots set in straight. When the soil is hard or stony a dibble is useful in making the hole for the plant. The droppers are instructed to drop occasionally an extra plant, to be used to fill vacancies later in the season. Before pulling the plants from the seed-bed, the latter should be thoroughly sprinkled with water, so that the roots will not be injured. Should a little dirt adhere to these, they will be more likely to grow and do well.

As soon as tobacco is set in the field, insect enemies usually commence their depredations upon the plants. The first of these insects to work upon the plant after it is transplanted to the field, are the cut-worms. These sometimes are very destructive. They eat off the young plants at the surface of the ground. When they are troublesome they should be hunted for in the morning, when they may usually be found on or near the top of the ground around the plants. The tobacco field should be passed over frequently after the first setting and plants from the seed-bed should be set in wherever any are found lacking. It is well to have plenty of plants for this purpose, as sometimes a great deal of re-setting is necessary to insure a perfect stand.

Cultivation of Young Plants.

As tobacco is a native of a tropical climate, and as quick growth is essential to produce a good quality of leaf, it should be the aim of tobacco growers to push the growth of the young plants as fast as possible after they have been transplanted into the fields. Frequent stirring of the soil has much to do with the growth of tobacco, because it prevents the surface from becoming hard or baked and lessens the injurious effects of drought. Next to a mulch, there is nothing more beneficial to growing crops in dry weather, than a mellow surface, which acts as a mulch in preventing the soil from drying out. This fact seemed to be generally understood by early tobacco growers in different parts of the world. Early growers of the "weed" in Virginia laid great stress on frequent hoeing, sometimes going over their fields five or six times, and stirring the soil around the plants. Our improved implements for cultivating make it possible for tobacco growers to do much of the work by horse power that was formerly done with a hoe. A good cultivator managed by a skillful workman, may be run very close to the plants without injuring them, thus saving much hand work. Cultivating should begin as soon as the plants commence growing, after having been transplanted to the field. The cultivator is run twice between each two rows, when they are hoed or "scraped," as the process is usually termed, which consists of skimming off the surface of the soil with the weeds from around the plants and substituting fine, mellow soil from between the rows. The cultivator should be kept running between the rows as long as the work can be done without injuring the leaves. The oftener the field is passed over the better, especially in dry weather. About two weeks after the first hoeing, the tobacco is again hoed. This time the work is done thoroughly and the extras which are not needed to fill vacancies are removed. Most growers practice hill culture and hill their tobacco at the second hoeing, which makes the work very laborious and costly.

It is doubtful whether this hilling is beneficial to the plants. Experiments have failed to prove its utility, and it is probable that the work might be omitted without detriment to plants if the soil is made perfectly mellow between them. The Alden thill cultivator is the most popular implement in use hereabouts for cultivating tobacco where the soil is not too stony. When the soil is hard or very stony the common five-toothed "digger" is preferable because it is stronger and penetrates deeper into the ground.

Chemung Co., N. Y.

Sheep's Fescue—Festuca ovina.

The genus *festuca* contains about 200 species widely distributed over various parts of the earth Some of them are our most valuable grasses for meadows and pastures. The one above named is exceedingly variable, so much so that botanists differ in regard to what should be regarded as a species. Sheep's Fescue is common on the hills of many of the Northern States, Canada and many portions of Europe. It extends far northward. It flowers early, makes a nutritious feed and is a favorite of sheep. It grows in small tufts which are quite attractive to a lover of nature. The writer admires it, especially on thin soil or lawns under the shade of trees. It is good for edgings. The leaves are slender and more or less glaucous. In some of the high lands of Europe it constitutes the chief herbage. It is too small for profit as a grass for hay. It roots deeply, stands dry weather well, and often grows on soil so poor that no other nutritious grasses can thrive. On rich soil, other grasses usually crowd it out.

Professor W. J. Beal.

Seeding Oats and Grass in Virginia.

There is a Farmers' Club called the Goose Creek Valley Club in this valley. The members on the 4th inst., met at my house, the subject for discussion being "Seeding Oats and Grass." The opinion of the club was that Winter oats should be sowed in the Fall from September 1st to the 15th; and that Spring oats should be sowed as soon as the Winter breaks, and that the proper quantity of seed is one bushel to the acre. It was also decided that grass seed should be sown directly after the harrow that puts in the oats, before rain falls on the land. Timothy ought to be sowed, without other grasses, a quarter of a bushel per acre. Clover and Timothy mixed should be in proportion of one-third of the former to two-thirds of the latter. Sow 11 lbs. to the acre. Orchard Grass and clover seed should be mixed 1½ bushel of the first to 1-16 bushel of the second to the acre. It was the opinion of the club that plaster sown on young oats and grass pays well. It is the practice with our farmers, as soon as the oats are ripe, to cut with the old five-fingered cradle; bind in moderate-sized bundles; shock in shocks of from 12 to 15 bundles, and, as soon as cured, stack or put away in barns. The oats with us have been an uncertain crop for some years past.

Bufordville, Va. P. L. B.

Yellow Hackberry Corn.—A correspondent writes us from Akron, Ohio, that this corn is sold in that market at 30 cents per bushel. It is earlier than most varieties of Dent; but it will not mature in 90 days—as a late inquirer asked—but it may mature in 110 days. It will not give so many bushels to the acre as other sorts; but its yield of shelled corn will be proportionately greater. In husking it is hard on the hands, having a rough, prickly surface.

Damaged Clover Seed.—A correspondent writing to us from Adrian, Michigan, early in the month, says that the clover seed dealers in Toledo, Ohio, had most of their stock submerged during the flood that visited that town a short time back, and that they afterwards had it dried for market. He considers that such seed would be so damaged that to palm it off upon farmers as good seed, would be a swindle.

Farm Topics.

SOLUBLE vs. INSOLUBLE PHOSPHATE.

PROFESSOR G. C. CALDWELL.

Phosphoric acid exists in manures, whether home-made or commercial, almost entirely in in the form of phosphate of lime. There are different phosphates containing the acid in different proportions, and there are varieties of phosphate of the same composition, all of which differ from one another to a greater or

less extent in solubility, in pure water, and in the soil water, which has a notably greater solvent power than pure water. It is self-evident that that phosphate will be the most remunerative which for a given price yields up to the plant requiring phosphoric acid in extra quantity the largest amount of the needed food during the growing season; but it is not so clear which kind of phosphate will fulfill this condition, and the same kind will not answer in all cases. Mineral phosphates from South Carolina, bone-meal, and superphosphate are to be found in our markets; in the first the phosphate is practically insoluble, in the second substance it is slowly dissolved in the soil; in the third we have more or less phosphate of three different degrees of solubility, viz., a part that is soluble in water, a part that is as insoluble as the mineral phosphate or as the bone-meal, according as the superphosphate was prepared from one or the other, and a third part that stands between as to solubility, or the so-called reverted acid.

Dr. Hoskins, in a recent communication to the RURAL, questions the reliability, at least for practical purposes, of the comparative trade valuation generally adopted in this country of the phosphoric acid in these three forms of phosphate. He thinks that reverted acid is quite as valuable as soluble acid; that bone ash, finely ground, is nearly as effective as soluble phosphate, and that South Carolina phosphate may be, if ground fine enough, nearly equal to bone ash. I should say that he may be correct, in respect to a part of these propositions, and that he may not, for it depends. In France and Belgium soluble and reverted acid are, it is true, held to be equal in value, for reasons based partly on the results of pot and field culture experiments, and no distinction is made between them in the analysis and valuation of a commercial fertilizer. But this view does not prevail elsewhere in Europe. The relative value of the two forms of the acid has recently been made the subject of much discussion, some of it quite acrimonious, in Germany. It appears from these discussions to be established that on sandy or peaty soils, poor in lime, the reverted acid may be fully as effective as the soluble acid, and in some cases it has even given a better return. It is supposed that in such cases the soluble acid, meeting no lime with the aid of which it can pass back into a difficultly soluble state and remain fixed in the soil and within reach of the plant during the season's growth, is really leached out of the soil before the crops can get hold of a sufficient quantity of it to affect the yield to any considerable extent. On the other hand, experiment has shown a better result, also on a soil quite rich in lime, with reverted acid than with soluble acid. In this case it was explained that the soluble acid, when taken into solution in the soil in the presence of such an excess of lime, passed quite back into the original condition in which it existed when first treated with oil of vitriol to convert the common phosphate into superphosphate; but the reverted acid applied to the soil, occupying an intermediate position as to solubility, remained in that condition in the soil, accessible to the plant and yet not so soluble as to be wasted.

Mercker, one of the most prominent of German agricultural chemists, while granting the validity of these conclusions as to the effect of reverted acid on soils either very poor or very rich in lime, affirms that, with respect to the large majority of soils on which superphosphates are used, we do not yet know what the comparative value of reverted acid is for producing crops; and the general feeling in Germany is that more experiments are needed to establish the conclusion which the French and Belgian chemists have already adopted. No figures have been given of any comparative experiments in this country that furnish any contribution to the solution of the important question. I am hardly ready, in the face of the widely prevailing opinion in favor of soluble phosphate, based on an experience of many years in England, Germany and the United States, to acknowledge that farmers should everywhere and on all kinds of soils, be as well satisfied with reverted acid as with soluble acid, when they are so situated that they can be sure of getting as good superphosphates as they ought to receive for the prices paid.

At another time I may notice the present condition of the no less important question concerning the use of bone-meal, bone-ash, or mineral phosphate instead of superphosphate.

The Horseman.

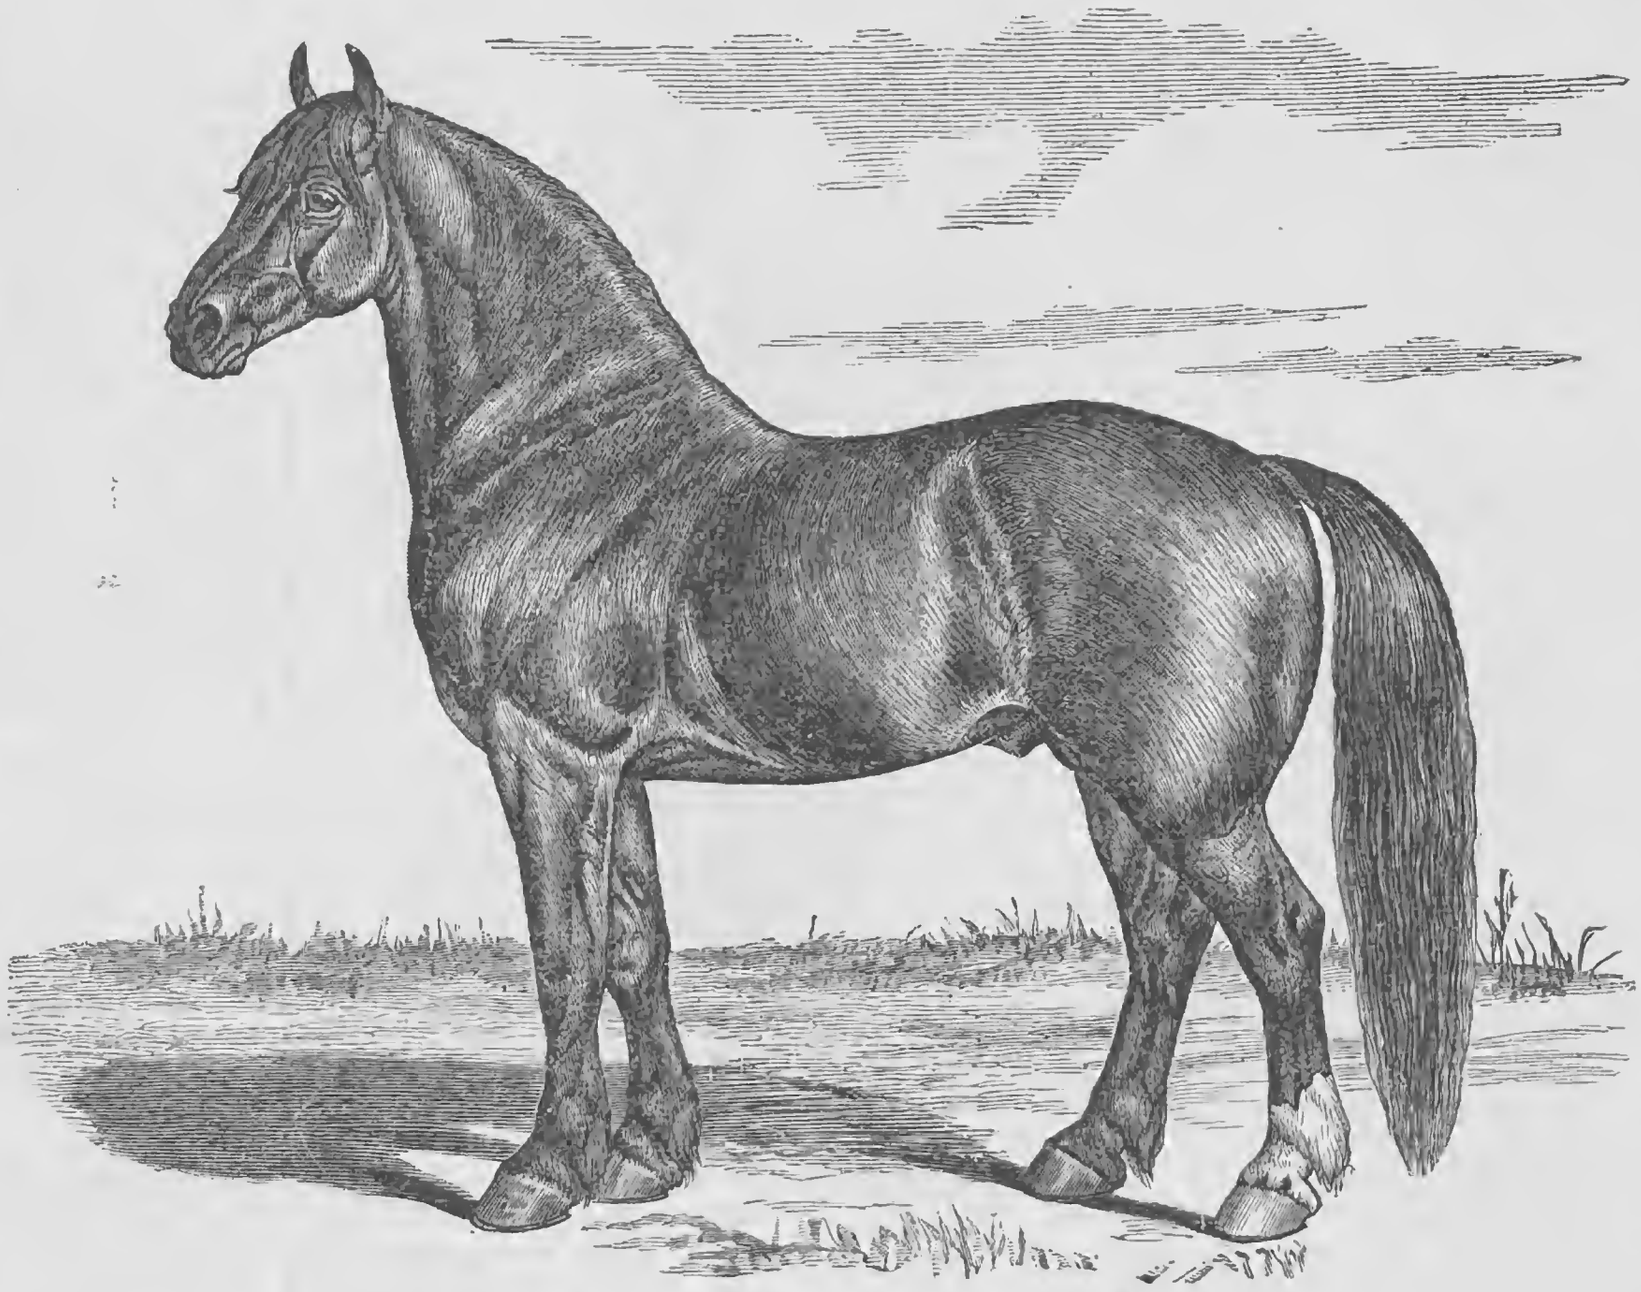
THE CLYDESDALE HORSE.

WHAT the Short-horn among cattle is to the English-speaking people, the Clydesdale is among horses—both are to be found improving their respective races wherever the United Kingdom has sent forth colonists, whether these have assumed their independence, as in the United States; or still remain subject to the Mother Country, as in Canada, Australia and New Zealand. Nor are exportations of these horses confined to these offshoots of Great Britain; for the breed is also employed to a considerable extent for improving the native stock of draft horses in France, Belgium, Russia and Germany. It speaks well for the Clydesdale that he "improves" on acquaintance; the better horses of this breed are known in any section, the more favor do they find there, and consequently not only is the number exported from Great Britain yearly increasing, but this Scotch horse is steadily coming into favor in England in competition with the choicest specimens of the best native breeds.

The Clydesdale owes his name to the place where the breed originated and which, with the surrounding country, is still the region where choice specimens most abound. This is the now busy vale of the Clyde along whose waters more vessels are built than beside any other stream in the world, and 21 miles from whose mouth Glasgow sends aloft dense clouds of smoke in token of her earnest life and industry. From the Middle Ages this region possessed a hardy race of pack horses, which were also good at the plow and other farm work. As the industry along the Clyde grew, however, a need arose for a heavier, sturdier race of horses, better able to accomplish the heavy work that the various sorts of manufacturing needs demanded. Towards the end of the last century, therefore, the Duke of Hamilton, who owned much of the land along the Clyde, imported a fine specimen of the Flemish stallion, which was crossed on the native race, ultimately producing the excellent breed known as the Clydesdale.

Among Clydesdales bays and browns predominate, with some white usually on the face or feet. The hight varies from 15:3 to 17:1 hands, though occasionally one reaches 18 hands; the weight generally ranges from 1,500 to 2,100 pounds, but sometimes as much as 2,500 pounds are attained. According to their weight, the Clydesdales are heavier-boned than horses of any other breed, especially in the limbs, which are wide, flat, cordy and hard. The bones, too, it is claimed, are exceptionally fine-grained and solid, to which circumstance is probably mainly due the fact that ringbones, bone-spavins, splints and other diseases of the bony structure are said to be unknown to this breed in their native land. The eye in the Clydesdale is prominent and unusually intelligent; the head neat; the neck light and well set on splendid shoulders. The barrel is round and straight; the body long and the quarters large and powerful. The mane and tail are both heavy, with a tendency to curl. From the knee and hock to the fetlock the back of the leg is "feathered" with long hair, a characteristic highly prized by Scotchmen as an indication of pure blood. In disposition this horse is gentle, though spirited, with abundance of courage and resolution. With or without a load he is an excellent traveler, for a heavy horse; is endowed with fine "staying" qualities, and is easily kept.

In this country the Clydesdales are rapidly striding to the front place in popular esteem as draft horses in cities and country places, and as begetters of prime serviceable stock crossed on our ordinary home-bred mares. Probably the largest importers of this breed are the Messrs. Powell Brothers, of Springboro, Crawford County, Pa., one of whose choicest imported Clydesdales is here represented. Scotland's Glory was foaled in 1873, at Balwhine, Aberdeenshire, Scotland, and imported in July, 1874. He is a handsome bay, 17 hands high, with a white left hind ankle. He has a wide, strong bone, fine action, and a powerful, symmetrical form. His sire was the 'Marquis of Lorne," a famous sire and prize-winner in Scotland.



CLYDESDALE STALLION, SCOTLAND'S GLORY.—FIG. 178.

The Herdsman.

CLOSE BREEDING.

THIS question, so ably advocated by "Stockman," has a side which I have never seen noticed by any writer on the subject. I consider the question of close breeding to establish family traits, to be entirely settled in its favor because the desired end cannot be reached by going outside of the family which possesses the desirable points. But, if we endeavor to perpetuate the good qualities, we must take great care not to carry along the weak points which always accompany them. Weaknesses, like weeds, propagate themselves, and weak parents always transmit their worst faults and never their best qualities. Breeding from too young or from immature stock, always results in irremediable deterioration. All efforts after that to correct this very common error only make the matter worse. We see this in every kind of stock in this country.

The stock of poultry now offered for sale as absolutely pure, is so badly demoralized by this "haste-to-get-rich" style of breeding as to be nearly worthless. The blood may be pure from improper crossing, (?) but it is so weakened by confinement to close yards, by breeding too young, and by breeding too many times in a season, that for any advantage it could have for the general improvement of the common stock of the country, fancy poultry has seen its best day, and with the present stock can never be regenerated. Mr. Curtis says "breeding to improve stock is an intricate work," and our breeders seem to multiply the intricacies faster than they do their customers. "Haste makes waste. The more haste the less speed." Any old almanac would teach even a *boy* better methods of breeding successfully.

S. RUFUS MASON.

HOLSTEIN SALES.

THE MESSRS. SMITHS & POWELL, of Syracuse, New York, say they have lately made the following sales of Holstein cattle:—To Messrs. Dye and Stillwel, Troy, Ohio, the Holstein cow Imogenia (333), which made a two-year-old record of 47¼ pounds of milk in one day, 1,262¼ pounds in a month, and the past season about 11,000 pounds in a little over 11 months; the imported cow Finesse with a record of 49 3-16 pounds in a day, 1,366¾ pounds in a month, and 10,330 7-16 pounds in 10 months and 28 days; the imported two-year-old heifer Gazelle (312), which gives promise of being a remarkable milker; the imported yearling heifer Ione (844); the yearling heifers Music (565) and Jnanita 2nd (562); the heifer calves Neilson 2nd, Finesse 3rd, and Leontine, and the bull calf St. Elmo, weighing, at 10 months, 900 pounds, an elegant animal and suitable in all respects to head such a herd as Messrs. Dye and Stillwel are founding. To Messrs. Whitman & Burrell, Little Falls, N. Y., we have sold the imported two-year-old Holstein heifers Lucretia Mott and Matchless (898) and the yearling bull Victor Knight and imported Gipsey Queen's heifer calf. To D. H. Burrell, Esq., we have sold the two-year-old heifers Orange Girl (863) and Finesse 2nd (561). To J. H. Ives, Esq., of Little Falls, the two-year-old heifer Undine (913). To E. J. Burrell, Esq., the two-year-old heifers Octoroon (916), Coral (907) and a heifer calf from imported Clothilde. To E. B. Ward, Esq., Detroit, Mich., the elegant imported Clydesdale stallion Perfection and the Clydesdale mares Middy Morgan, Molly Bawn, Madam Christy and Highland Girl, and the imported Holstein cow, Mabel (371), and the yearling bull Ingomar. To George Stilson, Livingston County, Ill, we have sold the yearling bull Vecai.

A Fine Milk Record for a Holstein Herd.

WE have numerous inquiries in regard to the milk records of our Holstein herd, and thinking they may be of interest to readers of the RURAL NEW-YORKER, we will mention a few:—Our cow "Aggie" is making a six-year-old record as follows:—84¾ pounds in a day; 2,362½ pounds in a month; and 17,206 pounds in 11 months, and she is still giving 35 to 40 pounds per day. "Ægis" has just closed her six-year-old record as follows:—82¾ pounds in a day; 2,289 9-16 pounds in a month; and 16,823 10-16 pounds in a year. "Lady of the Lake" dropped her calf when only 22 months old and has just closed her two-year-old record as follows:—45 13-16 pounds in a day; 1,344 11-16 pounds in a month; and 12,200¼ pounds in a year. We have several other two-year-olds which have given from 10,000 to 11,000 pounds; but they have not completed their records. We think the yearly average of our herd is even more remarkable than the individual records. We find that our entire herd of mature cows, including all that are four years old and over, have averaged, up to this date, 13,741 8-16 pounds and only three have completed their year's record. Our entire herd of two-year-old heifers that have been milked ten months or more, have averaged, up to this date, 9,614 10-16 pounds.

This record has been carefully kept by accurate weight of every milking with as much care as we have kept our cash account. This

average yield will give a better idea of the actual merit of this herd of cattle than any individual records. SMITHS & POWELL.

Syracnse, N. Y., March 1.

Scientific and Useful.

NEW JERSEY AGRICULTURAL EXPERIMENT STATION.—XI.

Ensilage.

IN this bulletin we give the results of a feeding experiment with corn ensilage.

On November 16th four cows of native breed were taken from the herd at the College Farm, placed side by side in the same barn and for a term of 91 days were fed, exercised and milked at the same time.

During the first period of 28 days a ration was divided among them, made up of 22½ pounds of clover hay, 49 pounds of wheat straw, 75 pounds of brewers' grains, 75 pounds of turnips and 7½ pounds of cotton-seed meal. It was calculated to furnish daily to each 1,000 pounds of live weight

2.5 pounds digestible proteine,
0.5 pound digestible fat.
12.5 pounds digestible carbohydrates,

this being, according to German investigators, the necessary amount of food.

For the second period of 28 days no change was made in the ration fed cows No. I. and II., while in that fed III. and IV. 100 ponnds of ensilage were substituted for 40 pounds of turnips; in other respects it remained the same as that fed during the first period; it furnished daily to each 1,000 pounds of live weight

2.50 ponnds digestible proteine.
.90 pound digestible fat.
14.90 pounds digestible carbohydrates,

This was fed in order to determine whether an increased amount of the heat-producing compounds, fat and starch, was rendered necessary by the severity of the weather. The additional food caused no increase in the yield of milk; cows I. and II., on the poorer ration, gave during this period more milk than during the preceding.

Our intention thus far was to ascertain the quantity of food required to keep these cows up to their full yield of milk.

For the third period, of five weeks, ending February 17, Nos. I. and II. were fed the same as during the first and second periods; to III. and IV. an equal amount of digestible food was given daily in 120 pounds of ensilage and five pounds of cotton-seed meal per cow; it was eaten without waste and with apparent relish.

We tabulate below the yield of milk for 13 weeks. It must be remembered that during the first period all four cows received the the same ration; that during the second and third periods cows I. and II. received the same as during the first; that cows III. and IV. were fed during the same period with an unusually rich ration, and during the third period with one made up of ensilage and cotton-seed meal alone, containing, however, an amount of food equal to that fed during the first period.

	I.	II.	III.	IV.
	7 y'rs. old.	9 y'rs. old.	6 y'rs. old.	6 y'rs old.
	Calved July 15.	Calved Oct. 8.	Calved Oct. 23.	Calved Oct. 10.
	lbs.	lbs.	lbs.	lbs.
Av. daily yield for 1st period	23.5	25.2	25.2	24.8
" " " 2d "	25.2	25.1	25.6	24.1
" " " 3d "	25.2	26.1	24.9	24.
" " 91 days	24.6	23.2	23.8	24.
	.8			

An opportunity is here offered to call attention to the fact that up to a certain point the yield of milk may be influenced by the quantity of digestible food, but beyond this point, which is determined by breed, time of calving and individual peculiarity, an increased amount of food fails to increase the yield of milk; ensilage can produce no more milk than any other fodder which contains an equal amount of food, a point well illustrated by the above table.

While the yield of milk and its percentage of butter cannot be increased at will, it is well known that its quality may be materially influenced by the feeding. It is claimed for ensilage that it makes "Winter butter equal to June butter"—a claim willingly admitted, butter made from the fodder being, to our knowledge, of unusually fine color and flavor.

The composition of ensilage is by no means constant, as the following table of analyses shows. Soil, variety of corn, method of planting and cultivating, and, above all, the time of harvesting, exert a decided influence on its quality.

The samples furnished by Mr. Pratt and Messrs. Whitman & Burrell had the characteristic vinous smell, which indicated that they had been exposed to the air before reaching the laboratory; and probably an analysis of a perfect sample would have indicated a larger amount of nutritive matter. From personal observation at the silo, we know that Mr. Platt's ensilage was as well preserved as any we have seen.

	Loss at 212° F. Per cent.	Proteine. Per cent.	Fat. Per cent.	Fiber. Per cent.	Ash. Per cent.	Carbohydrates. Per cent.
Mr. Mills, Pompton, N. J.	77.4	1.02	0.68	6.85	1.00	13.04
Mr. Morris, Oakland Manor, Maryland	78.51	.88	0.62	6.43	1.53	12.03
Buckley Brothers, Port Jervis, N. Y.	80.86	1.27	0.67	5.47	1.00	10.73
Coe Brothers, West Meriden, Connecticut	82.10	1.21	0.71	5.34	1.02	9.62
College Farm, New Brunswick, N. J.	83.52	.94	0.65	5.18	1.43	8.28
Mr. Platt, Suffield, Connecticut	88.56	1.06	0.73	5.76	.81	8.08
Whitman & Burrell, Little Falls, N. Y.	83.54	1.06	0.50	5.85	1.40	7.65
James Lippincott, Mount Holly, N. J.	84.28	1.37	0.50	4.68	1.26	7.91
Dr. J. M. Bailey, Billerica, Massachusetts	84.87	1.06	0.45	5.61	.98	7.03

In the above table the samples have been arranged with reference to their percentages of water and carbohydrates:—

The amount of ensilage to be used depends entirely upon its quality and upon the plans of the farmer.

Mr. Mills, for instance, could make up a full ration for a cow of 1,000 pounds live weight, by feeding daily 80 pounds of his ensilage and 5½ pounds of cotton-seed meal; while at the College Farm, with five pounds of cotton-seed meal, 120 pounds are necessary. In these rations nearly all the carbohydrates needed, and a portion of the proteine and fat, are furnished at a very low price by the ensilage; the balance of the proteine and fat is drawn from the cotton-seed meal. If desirable, a much smaller quantity of ensilage could be used and the carbohydrates given in form of corn-meal or any feed rich in these compounds; in ensilage they can be had, however, much cheaper than in any feed known to us at present. One thing must be considered: if the quality of the ensilage obliges the farmer to feed his cows more than 80 or 90 pounds daily per head, there is reason to fear that they will scour. The amounts fed by the above named gentlemen have varied from 65 to 80 pounds, and with these amounts no trouble whatever has been experienced. We therefore conclude that if the ensilage is of first-class quality, 80 pounds per day will furnish an animal with the full amount of carbohydrates; if it is of medium quality, it will be safer to limit the amount to about 90 pounds, furnishing the rest of the carbohydrates in form of feed or straw.

From the above experiment we feel justified in concluding that milch cows can be safely fed large quantities of this fodder, and that it is a perfect substitute for hay. The question of expense we reserve for a future bulletin.

GEORGE H. COOK, Director.

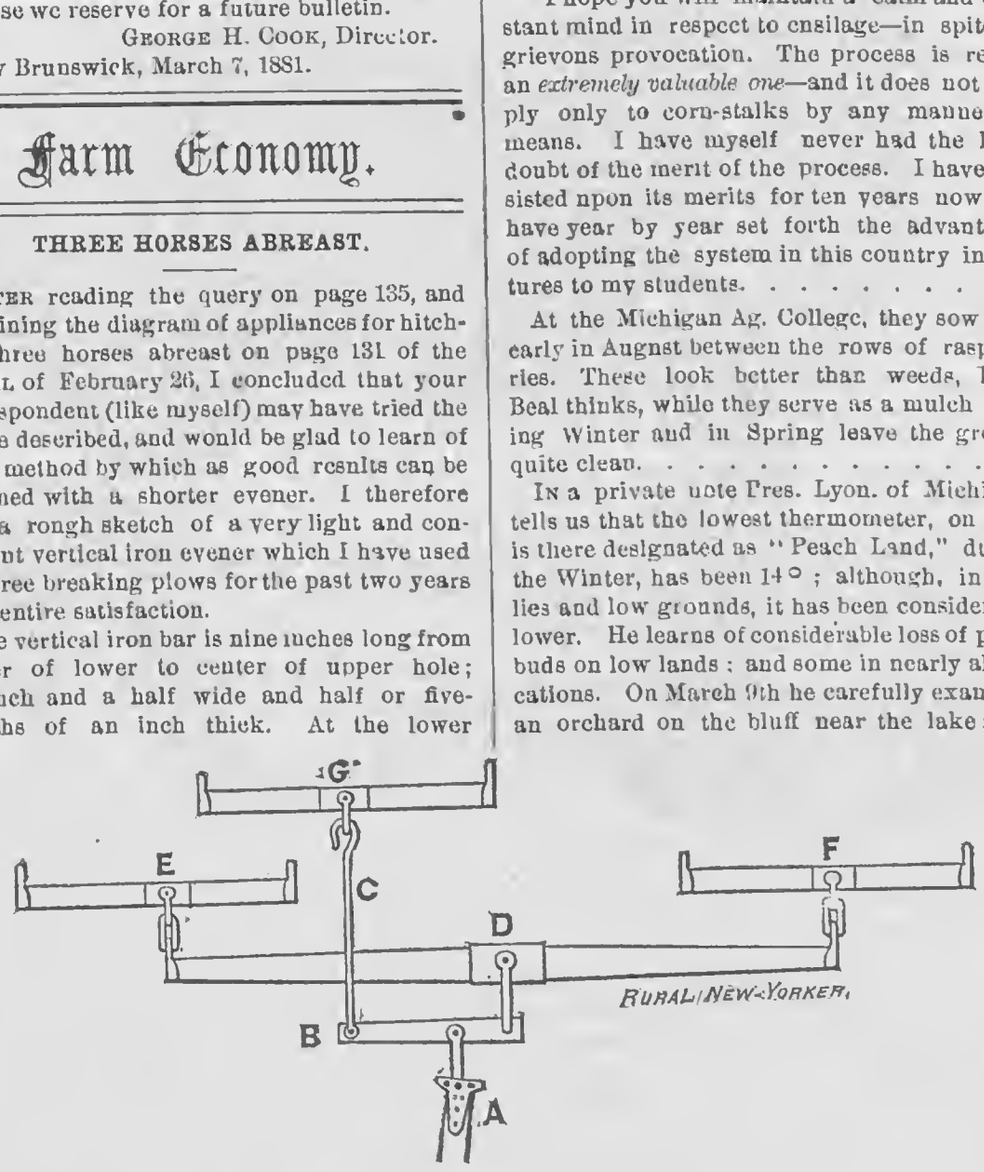
New Brunswick, March 7, 1881.

Farm Economy.

THREE HORSES ABREAST.

AFTER reading the query on page 135, and examining the diagram of appliances for hitching three horses abreast on page 131 of the RURAL of February 26, I concluded that your correspondent (like myself) may have tried the device described, and would be glad to learn of some method by which as good results can be obtained with a shorter evener. I therefore send a rough sketch of a very light and convenient vertical iron evener which I have used on three breaking plows for the past two years with entire satisfaction.

The vertical iron bar is nine inches long from center of lower to center of upper hole; an inch and a half wide and half or five-eighths of an inch thick. At the lower



THREE HORSES ABREAST.—FIG. 179.

link is attached a 3-feet-8-inches or 4-feet doubletree, to which the two outside horses are hitched by singletrees 21 inches long. One-third of the way from the doubletree to the upper hook is a draft link, where the plow is attached. The middle horse's singletree is hitched to a hook 10 or 12 inches long, thus placing the outside horses on an evener not much longer than an ordinary two-horse doubletree and giving the middle horse twice the leverage and raising his singletree nine inches above the whiffletrees of the other horses. This arrangement allows the team to travel close, and I find very little trouble in turning as wide as the plow naturally cuts *without* an equalizing side draft plate, which we were *compelled* to use with the 4½-feet evener and doubletree, such as is described in your diagram. By this method the weight of one long doubletree is saved, the draft equalized and the team allowed to travel so close as to draw the plow on a line, or nearly so, with the off horse in the furrow.

A, beam of plow; B, vertical iron bar 1½ inch wide, 9 inches long from upper to lower hole; D, link with 4-feet doubletree attached at lower hole three inches below plow-beam; C, hook 10 inches long with singletree, G, 22 inches long for middle horse, six inches above plow beam; E and F, singletrees 22 inches long for outside horses. W. P. D.

Mossing Ford, Va.

Miscellaneous.

RURAL BRIEFLETS.

MR. E. P. ROE writes us:

"I was a little surprised at what you wrote concerning 'potted strawberry plants.' I have found that they give very general satisfaction. I like potted plants so well that for my own Summer planting I use them as far as possible, preferring them to larger plants taken from an adjoining bed. I don't see how there could be much Summer planting without them in dry, hot seasons. It is a question that should be argued on both sides. You are the kind of a man who likes to hear both sides."

That is true, Mr. Roe, the RURAL is precisely that kind of a man. If strawberry plants are properly potted and are left in the pots long enough to hold a good part of the soil together when thumped out, the advantage is evident. But, taking our own experience as a guide, they are not, as a general thing, so sent out. Often the plants are root-bound from being too long potted or the soil falls off entirely because they have not been potted long enough. . . . . .

AN able scientist and respected friend writes us as follows:

"I hope you will maintain a calm and constant mind in respect to ensilage—in spite of grievous provocation. The process is really an *extremely valuable one*—and it does not apply only to corn-stalks by any manner of means. I have myself never had the least doubt of the merit of the process. I have insisted upon its merits for ten years now and have year by year set forth the advantages of adopting the system in this country in lectures to my students. . . . . .

At the Michigan Ag. College, they sow oats early in August between the rows of raspberries. These look better than weeds, Prof. Beal thinks, while they serve as a mulch during Winter and in Spring leave the ground quite clean. . . . . .

IN a private note Pres. Lyon, of Michigan, tells us that the lowest thermometer, on what is there designated as "Peach Land," during the Winter, has been 14°; although, in valleys and low grounds, it has been considerably lower. He learns of considerable loss of peach buds on low lands; and some in nearly all locations. On March 9th he carefully examined an orchard on the bluff near the lake; and found that from one-tenth to one-fifth of the fruit buds of the peach showed signs of injury, leaving enough to require thorough thinning should no farther calamity befall them. He is assured of a similar state of affairs along the lake shore, as far north as Muskegon and at Traverse City. . . . .

OUR readers will be amused while reading the following which we find in Sutton's Amateur Guide for 1881, published in London, England. It will be seen that our cousins in order to enjoy the "green cobs" of Indian corn are obliged to treat the seeds and plants as if they were those of some tender flower. The italics are ours:

MAIZE, OR INDIAN CORN.—"Few dishes are more delicious than the *green cobs* of Maize, boiled and served with fresh butter, and yet the cultivation of the plant has scarcely been attempted in this country. The seeds should be sown in April, in *boxes* which should be placed in a *cool vinery, orchard-house, or pit.* After the plants attain the hight of two inches they may be gradually *hardened off*, and should be *transplanted about the end of May.*"

If our English friends would procure seed of some of our quickest-maturing sweet corn, as, for instance, Early Minnesota Sugar or Moore's Early Concord, and plant it in warm exposures about June 1st, we have no doubt they might enjoy the "green cobs of Maize' without the trouble of sowing in boxes etc.

What Others Say.

THE SUGAR INDUSTRY.—From late proceedings of the Elmira Farmers' Club, as reported in the Husbandman, we take the following:

Mr. Little. "I measured exactly one square rod of ground beginning with a whole space between two rows, and finishing with a row, so that the plants on the square rods should have precisely the allowance of ground that every other rod gave. The other way I stretched a line across the rows to mark the boundary. From the square rod I cut 235 pounds of stripped cane that yielded juice from which I extracted two gallons of molasses that weighed twenty-two pounds and eleven ounces. Taking this rod as the average, I had 320 gallons of molasses to the acre—the weight, eleven pounds five and a half ounces to the gallon. To get this I threw out all small canes and cut off all waste. Another rod measured in the same way gave thirty-five pounds less in the weight of the gross product. . . . . .

I had the work done by hand with an old crusher I picked up and had run by two-man power. The boiling, as I have said, was on a stove at first with one open kettle, and afterward, as the kitchen work was done to give me full possession, I got three kettles going. In this way I got good molasses."

Mr. Brown: "I am informed that five pounds of dry sugar from a gallon of molasses weighing 11 pounds are a fair average. We sent some to a refinery in New York where 38 per cent. of sugar was obtained, and we are told that 48 per cent. of sugar was the full average of the best commercial molasses procured from the South."

A voice: "What soil is best?"

Mr. McKeel: "The plant adapts itself readily to the soil and situation, but I cannot say what composition of land is best for it. The best in saccharine yield I have found was that grown on sandy land, the poorest from muck, but the latter had more juice. So much depends on other conditions and circumstances that I dare not say any specified kind of soil is best."

Mr. Chamberlin, of Southport: "What is the cost per gallon of making molasses?"

Mr. McKeel: "My charge has been 25 cents for 11 pounds."

Mr. Chamberlin: "And that gives you good profits?"

Mr. McKeel: "I am satisfied." [Laughter.] The value of the sirup or molasses may be ascertained by use. I desired to increase the use, so I have sold it at five cents a pound, and it has gone off rapidly. I consider that a fair price, certainly low enough. . . . . .

In advising farmers who have consulted me about the land to be chosen for the cane crop, I have said, 'Take that which is suited to corn, and you will find that for every bushel of corn you might reasonably expect from that land, you will get about four gallons of molasses.'"

Mr. Little: "How much sugar have you been able to obtain from a gallon of heavy molasses?"

Mr. Reynolds: "By the use of a centrifugal machine without chemicals, about five pounds; by the aid of chemicals, possibly seven pounds."

SHOULD LIME BE MIXED WITH FERTILIZERS CONTAINING AMMONIA SALTS OR SOLUBLE PHOS. ACID.—"If we mix lime intimately with manures containing ammonia salts, the ammonia is set free as a gas and escapes into the air. Again, if we mix lime with a fertilizer containing phosphoric acid, or phosphates soluble in water, there is formed so-called reverted phosphoric acid, *i. e.*, phosphate of lime insoluble in water.

From these facts it has been inferred that lime should not be mixed with fertilizers containing either ammonia-salts or soluble phosphoric acid," says Prof. Johnson in his last

report of the Conn. Ex. Station. "This is, in fact, generally speaking, sonnd doctrine as applied to mixing fertilizers with lime before application. It should be remembered, however, that few fertilizers contain much ammonia-salts. Stable manure contains but three or four pounds of ammonia to the ton, and the ordinary superphosphates and special manures rarely contain more than two or three per cent. of ready-formed ammonia. On mixing with lime, enough ammonia might be liberated to affect the sense of smell, more or less powerfully, but the loss thus occasioned would be in most cases comparatively trifling, and far smaller than might be inferred from the odor, because the nose is a very sensitive test for ammonia, and because the intermixture and contact of the lime and the manure would be extremely rough and incomplete, and therefore such a mass might be left for days, giving off the smell of ammonia all the time, and then have lost but a fraction of that originally present. It has also been taught that it is a wasteful or injurious practice to apply lime to *the land* at or near the time of dressing it with stable manure, guano and superphosphates. This teaching is not always or altogether correct.

The mixing together, in the soil, of lime and fertilizers containing ammonia-salts, can scarcely occasion much loss, because the soil, by its moisture, by its humus, *i. e.*, vegetable matter in decay, and by the absorbent silicates, which are never absent from earth that has any moderate productive power, is ready to take up at once the liberated ammonia, and prevent any sensible waste."

As quoted by Green's Fruit Grower. Mr. J. J. Thomas says:—"The banker cannot invest a million dollars safely without knowledge of finance; the captain with no knowledge of navigation, would sink his ship. In no business is the serving of an apprenticeship more necessary than to him who plants an orchard for profit. He must know how to select the site and the varieties best adapted to his locality; he must select fruit that can be marketed to the best advantage; understand just how much to manure for the best results; know about cultivation, pruning, thinning, sorting, packing, shipping and selling, and these may involve innumerable qualifications. It would be interesting to inquire how many millions of trees have been set out for market orchards by persons who knew nothing of any of these particulars, and who supposed that all they had to do was to buy the trees and set them, when they would grow, take care of themselves, and, without further attention, bear heavy crops of silver dollars.

BAGS OR BARRELS, WHICH?—The question of substituting bags or cotton sacks for flour barrels is the subject of a lively discussion among Minnesota millers just now, says the Prairie Farmer. They maintain that sacks are preferable for several cogent reasons. First, on the score of economy sacks are the best, for while flour barrels are worth forty-five cents each, cotton sacks, holding half a barrel, are worth ten cents apiece. Again, it is declared that flour does not sift through a good cotton bag as much as through a barrel. All the flour shipped to Glasgow and Rotterdam goes in cotton sacks; and then the sacks are worth as much there as here. The advantage seems to rest with the sacks. It ought, if the change is made, to result beneficially to the farmer in the price of his wheat.

DR. LAWES says, in the London Ag. Gazette, that the complete exhaustion of the soil is not sooner effected is not due to any moderation on the part of the cultivator, but rather to the resistance which the soil itself offers to the too rapid removal of its treasures.

WHEN we hear a man boast of the length of his ancestry we are reminded of the quaint saying of the farmer. "The older the seed the worse the crop." . . . . . .

THERE are a great many moralists in the world who can write a good prescription for honest living but who seldom take any of their own medicine. . . . . .

WE have read the report of one farmer who has tried the White Russian Oats and, judging by this, we should advise that they be sown only for trial this Spring. . . . . .

FITZNOODLE says in Puck, "This man, (Jay Gould), by his powah, is now verwy little wemoved fwom an autocwatic wulah or emperwah, and has weally a gweat deal maw to say than many a Eurwopean potentate. It is quee-ah, extwemely quee-ah, that such things should exist in a wepublic which pwetends to be bettah in everwy respect than any othaw desewiption of government. . . . . .

JUDGE FRANK of the Montgomery County Horticultural Society (Ohio) said that his mother always succeeded in causing seed to sprout by placing coffee sacks over the seed-bed. . . . . .

The Washington Post says that Commissioner Le Due intends to stand by the agricultural interests of the country, just as long as the President will let him. The very fact that there is such a scramble for this position shows to our minds that General Le Duc, whether he has proven a wise, efficient officer or not, has certainly elevated the respectability and importance of the Department. A committee consisting of W. O. Atwater and others had an audience with the President to urge O. Judd for Le Duc's place. We no longer wonder why Judd's Agriculturist has so condemned General Le Duc. We should deem it a very sad blow to the interests of our agriculture if this Judd were successful. . . . . .

MR. BARRY, who brought the Sharpless Strawberry to notice, says it has more than realized his expectations. It might have been added that the R. N.-Y. was the first horticultural paper that ascertained its merits by its own tests. . . . . .

A WELL-KNOWN Illinois writer says, according to Mr. C. A. Green in the Fruit Grower, that the average Western farmer toils hard, early and late, often depriving himself of needed rest and sleep—for what? To raise corn. For what? To feed hogs. For what? To get money to buy more land. For what? To feed more hogs. For what? To buy more land. And what does he want with more land? Why, he wishes to raise more corn—to feed more hogs—to buy more land—to raise more corn—to feed more hogs—and in this circle he moves until the Almighty stops his hoggish proceedings." . . . . . .

BOOKS, CATALOGUES, ETC.

JOHN SAUL, Washington, D. C. Catalogue of new, rare and beautiful plants, 104 pages. Crotons, dracænas, carnations, fuschias, verbenas, phloxes, etc., with a beautiful colored plate of the roses, Duke of Connaught, Pearl and Beauty of Stapleford. Sent free. Also a DESCRIPTIVE CATALOGUE of Roses of all kinds.

HOOPES BRO. & THOMAS, Westchester, Pa. Hand-book of Beautiful flowers, 80 pages. Finely illustrated and full of trustworthy information. Each plant is correctly named and full instructions for successful cultivation are given. Sent free to our subscribers.

T. S. HUBBARD, Fredonia, N. Y. Wholesale price-list of grape-vines, fruit trees, etc.

L. W. GOODELL, Amherst, Mass. Illustrated Catalogue of seeds and bulbs.

Miscellaneous.

THE AMERICAN CANE MANUAL with descriptions of the American sugar machinery, manufactured by Geo. L. Squier & Brother, Buffalo, N. Y.

CIRCULAR AND PRICE-LIST of D. B. Wooster's Perfection Creamery, manufactured by M. D. Chapin, Poultney, Vt.

CATALOGUE OF SANDWICH CORN SHELLERS, fully illustrated, made by the Sandwich Manufacturing Company, Sandwich, DeKalb Co., Ill.

ADDRESS of the Hon. Marshall P. Wilder, and the other proceedings of the New England Historic Genealogical Society. Published by the Society; 18 Somerset St., Boston, Mass.

WATERTOWN SPRING WAGON CO. Illustrated Catalogue of wagons and buggies. Manufactory at Watertown, N. Y. This will be sent to applicants without charge.

A TREATISE upon Extracted Honey, Harvesting, Handling, Marketing. By Charles and C. P. Dadant, Hamilton, Ills.

A SKETCH of the Tobacco Interests of North Carolina. By J. D. Cameron—109 pages. Single copies 50 cents, in postage stamps or otherwise, W. A. Davis & Co., Oxford, N. C.

ILLUSTRATED CATALOGUE of Bee-Keepers' supplies—30 pages. Alfred H. Newman, 972 West Madison St., Chicago, Ill.

B. S. WILLIAMS, Upper Holloway, London, N., England. Descriptive and illustrated catalogue of flower, vegetable and farm seeds—75 pages.

HOOPER & Co., Covent Garden, London, England. Seeds, plants, roots—90 pages.

THE RURAL A NATIONAL PAPER.—I read with great pleasure the interesting report on the large corn crop raised on the Rural Experiment Farm, and would like to see a full description of the farm together with an account of its situation and surroundings. This should be given for Long Island's sake. The reports of the experiments in corn raising are very valuable and should be extensively known to Long Island farmers, so that the RURAL'S light may shine in dark places that still prevail on a large part of the surface of that highly favored island. In it there are still thousands and thousands of acres that lie uncultivated, though excellently suited for gardens or farms, and if it were known that these could produce good crops, they would soon yield abundant wealth under the influence of judicious tillage. E. F. PECK, M. D.

(We thank Dr. Peck for his suggestions. Though the Rural's Experiment Farm is on Long Island, we have the same interest in Colorado, Kansas, Texas and New England as in Long Island. We must consult the interests of our subscribers who are as numerous, according to population, in other States as in this State. There is no better *center* for a national agricultural paper than New York. A full description, together with a bird's-eye view, of the Rural Farm was given in our Fair Number last year. Eds.]

THE BLANCHARD CHURN.—One of the oldest if not the oldest manufacturies of churns is located at Concord, N. H. Messrs. Porter Blanchard's Sons are pioneers in the business, and the materials used, and the workmanship employed are the best that money can procure. One of our staff had the pleasure recently of making a thorough examination of the works, and we can unhesitatingly say that the Blanchard Churn is made "upon honor" and, with proper usage, will last a life-time. Those of our readers who are in need of a first-class churn, should examine into the merits of the Blanchard before purchasing another. B.

Everywhere.

WINTER WEST OF THE MISSOURI RIVER.

A VERY general remark, even with our own people, is: "This is the most severe Winter we have ever gone through." While perhaps true in certain respects, in most others it is not. The weather has not been colder than it has been quite frequently before. The Winter has been more protracted; there has been more cold weather; it has been continuous from about November 1st to March 1st. There has been more snow, the ground being well covered for more than one-half the time indicated. Notwithstanding all this, hardship, suffering, loss of stock, etc. have not been greater than corresponded with other Winters, all things considered. Crops last year were good and food for man and beast is abundant and cheap. As a rule, the people were in all matters better prepared than heretofore for Winter, and consequently they have been more comfortable. Stock that has been provided for has gone through the Winter well, and is in good condition. Large herds on the plains, with little, if any, provision or protection save what was afforded by nature, have suffered, and some have been lost. The accounts of losses, however, which have obtained publicity in the East, have been greatly exaggerated. Storms have scattered cattle, driving them from accustomed ranges, and water supplies have been short by reason of freezing. These misfortunes have contributed to make the losses rather heavier than usual. The natural food supply has been as good as, if not better than, usual. Upon the whole, cattle-men have no particular reason to complain. Such losses are always taken into consideration, and are expected. This is about the sum and substance of the past Winter between the mountains and the Missouri River.

Unless we shall have a late Spring every indication favors bounteous crops this year. The soil was well saturated with Fall rains, and, as said, snow has been abundant, therefore the ground cannot fail to be in good condition for farm operations. The Winter being steady, regular and dry, with altitude favorable, fruit prospects are good, with the exception, perhaps, of peaches. All other standard fruits as yet promise well. Winter wheat, of which an increased acreage was put in last Fall, ought to open up well this Spring. It has been well protected by snow. The ground is yet well covered. Spring wheat will be late. Usually seeding is done principally during the latter part of February and early March. This Spring but little will be done in March even. Late Springs are characterized by rapid growth and progress and followed by late Falls. There is about "so much" growing and producing season, be Spring or Fall late or early. Trusting, persistent tillers of the soil look forward with faith to abundant crops the current year.

Brownville, Neb., Mch. 15. R. W. FURNAS.

RURAL SPECIAL REPORTS.

IND., Newton's Retreat, P. O., Tippecanoe Co., March 14.—This has been the severest Winter this place has had since 1843. The ground has been frozen all the time since the 13th of November. J. A.

KAN., Edgerton, March 7.—This has been the most severe Winter I have known during a residence of 24 years in this place. Never before in the history of Kansas has the earth been frozen to such a depth and over so large an extent of country as during the present Winter. In many places the ground is frozen to a depth of from two to three feet, and has been in this condition for over four months, the mercury on one or two days reaching 16 deg. below zero. During December and January the ground was bare, the weather dry and cold—fine for feeding, as stock eat everything up clean, and there was no waste. But with the advent of February came our share of storms, both snow and rain, the snow being drifted so that the highways in many places were impassable. Fruit trees are uninjured, although peach buds are all killed and some cherry buds.

A. B. D.

KANSAS, Havenville, Pottawatomie Co., March 10.—The wheat crop of Kansas was rather under the average last year, and the same may be said of corn and oats; but, take Kansas all together, the crops were a fair average. This is a hard Winter. Our big snow is mostly gone, but we had a light one lately. Stock in these parts have wintered well; but there is a good deal of black-leg among calves. Butter is worth 18c; eggs, 14c; wheat, 60c to 70c; oats, 23c; corn, 23c.

J. H. W.

MICH., Saugatuck, Allegan Co., March 9.—This has been a cold Winter for our "American Italy;" still I think there will be a fair crop of peaches on the higher grounds, and plenty of other fruit. This is the paradise of the fruit grower. Peaches have only been killed twice since the settlement of the country and then the buds were not entirely killed; the trees never have been killed. The Northwest furnishes an insatiable market almost at our door, or just across Lake Michigan—our great warming-pan. J. S.

MINN., Fair Haven, Stearns Co., March 14.—The Winter has been a very severe one, with a great amount of snow and a great deal of wind. The depth of snow has greatly impeded lumbering in the pineries; business is, therefore, dull, every one complaining of hard times. M. R. L. M.

NEB., Jamestown, Dodge Co., March 9.—No Winter wheat is raised in this vicinity Last crop of Spring wheat about 10 bushel per acre. Corn light. Dry weather and chinch bugs ruined some fields. Yield from five to forty bushels per acre; perhaps one-third the latter. Oats exceedingly light. Potatoes a very poor crop. Rye poor, and very little sown. No sorghum is raised. A few have just begun to put out fruit trees and berries. Some of the neighbors have wild plums set out. The fruit was very good last Fall. I moved on my farm one year last October. I have set about 125 fruit trees. They did well last season, but my small fruits were nearly all killed by the dry weather, still I am trying again. Our Winter has been very cold and windy almost since November. J. M.

N. Y., Troupsburg, Steuben Co., March 1.—We have had very cold weather since about the middle of November, with good sleighing most of the time. Hay is selling in the barn for from $12 to $15 per ton; oats, 40c. per bushel; corn, 60c. This section is well adapted to grazing and cows are the principal stock kept. L. H.

VA., Bufordville, Bradford Co., March 10.—I live in a beautiful valley or cove formed by the Blue Ridge Mountain and one of its spurs, 38 miles west of Lynchburg. Fine beds of iron ore are all along the Blue Ridge Mountain. Some of them near the A. M. O. R.R., are now being worked and the ores shipped North and East. Tobacco is the principal crop. As fine a leaf as is raised in any State is produced in this neighborhood. Planters sometimes average from $25 to $30 per hundred for their crops. The Winter has been severe. Lands are selling in this county for from $5 to $15 per acre. Wheat looks bad, as we have had but a few warm days since the middle of November. G. L. B.

WASH. TER., Yakima City, Feb. 28.—The Winter has been very severe in this section. Residents of old standing report that nothing like it has been known before. Losses in stock are very heavy. Hay that sold for $4 a ton in the Fall has gone up to $75 a ton and hard to get. W. D.

WISCONSIN, Whitewater, Walworth Co., March 12.—We are having a very hard Winter in this section. Snow, rain and wind most of the time for 10 days; roads all blocked up; railroad trains delayed three days, and it is snowing very hard to-night: a heavy northwest wind is blowing all the snow off the prairie and marshes, and piling it in sheltered places around houses, barns, etc. Plenty of hay in this part. Corn at 45c; hogs, $5; hay, $7 to $10. H. A. S.

The Querist.

ANSWERS TO CORRESPONDENTS.

Green Manuring.

F. G. A., St. Petersburg, Pa., says he has some poor land which he wishes to render productive, but he has no manure. Last Fall he sowed it to rye, which he intends to plow under next June, and he asks whether millet is a good crop to sow after that, to be turned under in September; would it fit the land for seeding the following Spring—soil clayey.

ANS.—Buckwheat would be the best plant for "green manuring," on a poor clay soil. It is certain to germinate, grows rapidly, shades the ground most perfectly, and leaves the land in a friable condition. Sow about one-half bushel of seed per acre any time after all danger from frost is past; plow under when in full bloom. Millet is somewhat uncertain in germinating, grows slowly when young, and leaves the land rather the reverse of friable. If the land is to be seeded to Timothy (Herd's Grass) it should be sown by the first week in September; if with clover, another crop of rye might be sown, and turned under the first or second week in May. This would be early enough to insure a good "catch" of clover, if no grain was sown with it. A plow with a jointer should be used in order to perfectly bury all the vegetable matter. Give most *thorough* and *persistent* surface culture, and give a little time for plant-food to be set free before any seed is again "cast in" and it will then germinate quickly and grow rapidly. To illustrate experimentally the effects of *superior* culture a friend selected in 1873, a piece of poor clay soil upon which was growing a very light crop of oats. Two-fifths of an acre was most thoroughly prepared and sown to wheat in the Fall of 1874, and it has borne a crop of wheat, without any fertilizers whatever, every year since, except in 1879, when the ground was summer-fallowed. The results are as follows:

				lbs.
1875	season	poor;	yield	158
1876	"	fair;	"	369
1877	"	superior;	"	694
1878	"	fair;	"	637
1880	"	fair;	"	720*

* 30 bushels per acre.

Making an Aquarium.

D. S., Burlington, Ind., asks, 1, how to make an aquarium; 2, what kind of plants should be put in one; 3, where can they be obtained, and whether a small water turtle in one would be likely to eat the fish it contained.

ANS.—1, Most aquaria are square in form, as the greater the number of sides, the greater is the liability to leakage. If metal posts are used, they should be plated, as oxidation often proves disastrous. Hydraulic cement should be used to keep the plates in position, but if putty is used, it should be painted, and the tank filled with water a week or more before the fishes and plants are put in. Cover the bottom to the depth of an inch or more with sand and on this strew pebbles; rocks containing much mineral substance should be excluded, and shells should be rid of all organic matter contained in them. The tank should be at least a foot deep, and when filled with water to within an inch or two of the top, it is ready for occupation. 2, River or pond plants that bud and root from joints on the stem can be raised by securing them in tufts to the sand in the bottom of the tank, by a light layer of pebbles. Water thyme, water crowfoot, milfoil, and starwort may be planted in this way. Caution should be taken as to the number of inmates and their habits. The gold fish is most commonly used, with the perch, minnow, stickleback, etc 3. We have seen small turtles in such tanks and have never heard of their destroying their "room-mates." We should think that sufficient plants for the purpose could be obtained along banks of streams and ponds with little or no cost.

Leather as a Fertilizer.

T. H. W., Oberlin, Ohio, wishes to know how best to convert old boots, shoes and bits of leather into an available fertilizer.

ANS.—Such leather contains, according to Prof. S. W. Johnson, from five to eight per cent. of nitrogen, but it is totally unavailable to vegetation, of course, unless the leather is brought into a state of decay or is acted upon by some powerful chemical agent. But it is specially prepared to resist decay and hence is very slow to fall into that condition when brought into the soil. The activity of leather as a fertilizer is hastened by fine division; but there have been no cheap means devised of pulverizing it. Prof. Johnson says it may be rendered brittle by roasting at a moderate heat, and then may be easily ground to powder. Prof. Storer has shown that roasted leather, while it shows some slight nourishing value, is still comparatively so inert that it can scarcely have any definite money value as a manure. It is, in fact, no better fertilizer in respect to nitrogen supply than simple peat. Question as to cheese will be answered in due time.

Marking Sheep.

J. A., Jamestown, N. Y., asks what is the best method of marking sheep—he objects to cutting their ears.

ANS.—The only permanent marks for sheep are the ear-marks of metal inserted in the ears in holes made by a punch. There is no cruelty in the operation. It is not nearly so painful as docking a lamb, or a hundredth part so much as castration. The cut in the ear is made instantaneously and at every shearing the sheep is considerably more hurt by cutting than in ear-marking in the above manner. Temporary marks may be made across the nose by means of red, blue and black paint so disposed as to represent the numbers. Any person can form his own key of numbers. But the objections against marking by means of the metallic clips are in reality quite groundless.

Miscellaneous.

H. T P., Glens Falls, N. Y., asks, 1, what amount and kind of manure or commercial fertilizer would be best for a small garden in town, the soil of which is naturally rather poor, low and damp; 2, which is the hardiest, most productive and finest-flavored of the three raspberries—Cuthbert, Gregg and Caroline.

ANS.—1. It should be drained before plants will thrive, no matter what manure may be used. It would then be best to plow or spade under a heavy spread of stable manure. A top-dressing of bone flour and wood ashes raked in might also prove advantageous. 2. They are all extra-hardy kinds. The Cuthbert is red; the Caroline yellow or salmon; the Gregg black. The last-mentioned is large but of rather poor quality. The first and second are excellent. Considering quality alone, we should prefer the Caroline.

E. D. B., Seneca Falls, N. Y., asks, 1, would it do to sow Honey Locust where a hedge is wanted and afterwards thin out the young plantlets; 2, is it best to sow seed so soon as the ground can be got ready, taking the risks of a severe frost afterward; 3, should last year's growth be cut down to the old wood; 4, where can a work on hedges be purchased.

ANS.—1. There would be too many lapses. It would also be more troublesome to cultivate them. Better to raise them in nursery rows. 2. Yes. 3. That is just as you prefer. It depends, however, somewhat upon the *length* of the old wood and upon the number of secondary branches. If the plants are sufficiently thick, then leave some of the new wood. 4, Warder's Hedges and Evergreens; price $1.50, to be had through the American News Company, this city.

G. S. F., Stoney Creek, Ont., Can., and several others, ask whether Manning's Illustrated Stock Doctor is reliable; and where can it be bought and its price.

ANS.—In our notice of the book in the RURAL for March 12, we stated that the work is chiefly a careful compilation from various good authorities on the subjects discussed. We understand that the compilation was made mostly by Jonathan Periam of Chicago, a careful and experienced agricultural writer. The price of the book bound in cloth, is $4.75: and bound in leather $5.75. It can only be obtained through the agents or canvassers of the publishers, Messrs. Hubbard Bros., 723 Chestnut St., Philadelphia, or direct from that address.

J. H. O., Pittsford, N. Y., asks what kind of commercial fertilizer is best for raising onions from the seed and how to apply it—barnyard manure he finds produces too many weeds.

ANS.—We presume that that formula which approximates most nearly to barnyard manure would suit best for onions. Such manures are put up by the Mapes, Bowker or other fertilizer companies. Or the different fertilizers may be purchased separately and mixed when and as desired. All of our fertilizer companies prepare their manures for special crops, such as for wheat, corn, grass, onions, cabbages, tobacco, etc. All interested should send for pamphlets, etc., which will explain such matters.

W. D. I., Yakima City, Washington Territory, asks, what can he do to save his six-year-old pear trees barked by hares. One tree has the bark on the main stem peeled off for half a foot, and he wishes to learn what he should use to coat over the wound in the bark. He intends to wrap canvas tightly round the tree and then on this apply a coat of pitch, and he asks whether it should be left on through the Spring.

ANS.—We believe that a simple wash of whale-oil soap and lime has saved our fruit trees. The rabbits have not touched the stems where this has been applied. The canvas without the pitch is as good as anything we can suggest.

W. C. S., Jefferson, Ia., wishing to plow under a piece of rye and plant the ground to potatoes, asks whether the heating of the green crop will injure the potatoes, if planted every third row, and whether rye is good for that particular crop; also when would be the right time to plow it under in order to get the best results.

ANS.—If we understand the above question rightly, we must take the view that the rye should be turned under as soon as the ground becomes dry enough to plow—else we should think the potato crop would prove unsatisfactory. Rye is about as good as any green manure.

A. C. R., South Richmond, N. Y., asks which is the best early Strawberry for market, and where is the best place to get plants.

ANS.—Probably we had best refer our friend to the Small Fruit Number. Crescent Seedling, Duchess, Crystal City, Glossy Cone, French's Seedling are among the earliest, but they should be purchased only with a knowledge of their peculiarities and the conditions under which they thrive. Any of the nurserymen who advertise them in the RURAL, will supply what they offer.

H. C. H., Blodgett Mills, N. Y., asks, 1, the address of a manufacturer of small-fruit baskets; 2, whether there is any unoccupied land on Long Island.

ANS.—1, N. B. Batterson, Buffalo, N. Y.; 2, There is a considerable area of unoccupied land there; but it is all owned by somebody, some of it being held for speculative purposes. Most of that sort of land lies at the eastern end of the island.

J. H., West Granby, Conn., asks, 1, where can he get the wild corn of America; 2, what is the best work on ornithology.

ANS.—1. We do not know. Except for experimental purposes or curiosity, it is a worthless sort. 2. Audubon and Bonaparte's is probably the best American work on the subject; price $7.50, to be had through the American News Co., N. Y.

The Hoosier Drill Co., Richmond, Ind. says: "Mr. Sadet wishes us to purchase him a good corn husker. We would like to know of you if you have any knowledge of a successful one and, if so, where?"

E. H. N., Shoreham, Vt., asks, 1, how far apart should sorghum be planted in drills; 2, how near should asparagus be planted.

ANS.—Both these queries are answered in "Notes from the Rural Grounds" in this issue.

G. H. P., Brooklyn, N. Y., asks when to plant doura, sorghum, teosinte and millet.

ANS.—Plant the latter part of May. It would avail nothing to plant earlier.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, MARCH 19.

THE COMING STRAWBERRY

BIDWELL. The Genuine *Headquarter Stock.* Having secured from the originator all of his stock and also from Mr. T. T. Lyon, Pres't Mich. Pom. Society, and disseminator of the Bidwell, all the stock owned and controlled by him, I am able to supply this most promising of the new strawberries in limited quantities. The First Premium was awarded to the Bidwell as the "Best New Variety and Plant," by the N. Y. Hort. Society in 1880. Also a superb stock of the celebrated.

CUTHBERT RASPBERRY.

An exceedingly liberal offer of these two fine fruits, with my book "Success with Small Fruits." Descriptive Catalogue free. Address

STRAWBERRIES.
The New and the Choicest.
I will send this whole collection of 122 plants by mail for $4.00; by express for $3.00. See my free catalogue for special offers on New Grapes, Fruits and Flowers for the Family, &c. Strawberry Culture for a 1-cent stamp. 12 Kirkwood or Mt. Vernon, $1; 12 Longfellow, 50c.; 12 Warren, 50c.; 12 Marvin, 50c.; 12 Brilliant, 60c.; 12 Glendale 50c.; 12 Sharpless, 25c.; 12 Cum. Triumph, 25c.; 12 Duchess, 25c.; 12 Downing, 25c.; and 2 of the Bidwell, 25c. Order early.
GEO. S. WALES, Rochester, N. Y.

NIAGARA, The New White Grape.
A few responsible parties in good grape regions are wanted to plant *vineyards* of this most promising of all grapes, to whom special inducements will be given, and payment for vines made contingent upon production of fruit.
Address THE NIAGARA GRAPE CO.,
Lockport, N. Y.
☞ For description of this Grape, see Rural New-Yorker of March 5.

MANGEL, CARROT
AND
TURNIP SEED.
Yellow Globe, Giant Red, etc., 40c per lb. Ask for Catalogue. Stamp required for Sample Packet of Vegetable or Flower Seed.
TUISCO GREINER, NAPLES, N. Y.

GRAPE VINES.
All leading varieties in supply. Warranted true to name. Prices low. Also the celebrated NEW WHITE GRAPE, PRENTISS. Also trees, small fruits, etc. T. S. HUBBARD,
FREDONIA, N. Y.

GET YOUR VINES AND BERRY PLANTS OF
E. & J. C. WILLIAMS,
☞ Catalogues Free. Montclair, N. J.

10 NICE CONCORD GRAPE-VINES for $1, by mail post-paid. *Think of it!* Order now for early Spring shipment. *Circulars free.* Wm. B. Reed, Chambersburg Nurseries, Chambersburg, Pa. Mention this paper.

BULBS Seeds, Plants,
5 pkg's flower seeds,.....10c.
5 good Gladioli,.....10c.
8 good roses, $1. *Try them. Catalogue free.* H. HALLOCK,
Creedmoor, N. Y.

BERRIES For all CUTHBERT or SHARPLESS Free. 100 kinds. For circulars with *Points* and *Prices*, address

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, MARCH 26 1881.

With our present information, we think the R. N-Y. has reason to congratulate itself that it has rather opposed than advocated the use of barb-wire fences for farm inclosures. We are laboring under the belief that they will be heartily condemned ere many years.

Immense fields of pampas grass are being cultivated in Southern California—so great is the demand for those beautiful plumes. Perhaps in the not distant future they will enter into the decorations devised by milliners, and supersede the plumes of the ostrich.

Professor Birchoff, of Munich, announces that a woman's brain weighs about 10½ per cent. less than that of a man. The average weight of the masculine brain he places at 1,362 grammes, and that of the woman at 1,219 grammes, and he has examined about a thousand brains. So much for brains in Germany. The professor should come to America where the brains of women are altogether another affair. But it is a well-accepted adage that the best goods are in the smallest bundles, and that quality, rather than quantity, is the measure of value.

Pistillate varieties of strawberries are increasing in number. Is this due to the fact that, in making crosses, pistillate flowers are used for the seed bearers instead of emasculated perfect flowers? It seems reasonable that it should be so. If pistillate flowers are placed beside perfect flowers away or protected from other kinds, of course, if the pistillates bear fruit, the pollen was furnished by the perfect flowers. This is a much easier way of effecting a cross than by destroying the anthers of perfect flowers. But the tendency of such breeding will propably be still further to increase pistillate kinds, which is not desirable.

Rubber boots are cheaper than the doctor. They cost from $2.00 to $3.50 per pair, for boots for babies up to adults. For children, they are indispensable during the wet seasons, as the little ones never thrive well without fresh air and sunshine. They can well do without ribbons, feathers and furbelows. Give them instead rubber boots and insure for them dry feet, and peace of mind for yourself. Next to the boots, never allow them to go to bed with cold feet, neither go to bed with cold feet yourself. Warm, dry feet at night form a pretty sure guarantee that you'll waken in the morning alive, and be free from a cold.

The Foresters' Department in the British East Indies is said to be the largest and best managed of any in the world. It is now proposed to bring one of the foresters from that country to superintend the forests of Great Britain, and have arboriculture taught students there, as has long been done in France, Germany and Switzerland. We wish such a school could be established by the United States Government. A lamentable destruction has long been going on in our forests ever since the settlement of the country. If they were annually thinned out as needed, in a judicious way, instead of being mercilessly slashed down by the wholesale, they would furnish all the wood and timber we want, and still keep up the necessary growth from the younger trees for future requirements.

A Good Year for Agricultural Colleges in the West.—We are informed by reliable authority that the Legislature of Kansas appropriated all that was asked for in support of the Agricultural College without a dissenting vote in the Senate, and only seven dissenting votes out of nearly two hundred in the House. There was no abuse by any member. At Purdue University, in Indiana, a large appropriation went through easily without a scratch. At Lansing, Michigan, the Legislative committees added by a unanimous vote 2,200 dollars, and intended to add a thousand more to the amount asked for by the college. The last thousand was omitted by oversight, but may yet pass in a separate bill. The items added by the joint committees were mostly for experiments. The bill went through easily with very few opposing votes. The appropriation for two years was about $63,000.

Distinguished Hungarian Landholders on a Visit to the United States.—Six of these, namely, the Counts Andrassy, J. and G. Szechanyi, and E. Hoyos; Baron Gudenus; and Dr. Rudolph Meyer, are now making the tour of our country for the purpose of informing themselves as to the vegetable, grass and grain crops, the best methods of growing them, and the machinery used for this purpose and preparing them for market; also to examine the different breeds of our domestic animals, their rearing and fattening; and especially cattle, with a view, we dare say, of seeing if they cannot share with us in the foreign supplies of the British market. These gentleman possess very large estates in Northern Hungary, near the Carpathian Mountains, whence spring the sources of the river Theiss. The climate there, we are informed, is much like that of New England, but the soil is somewhat different. The seasons for the two past years have been very disastrous—a great failure in all sorts of crops, and want and suffering are among the peasantry in consequence. Strong men can be hired there for 15 cents per day and the people have been living for some time chiefly on coarse black bread, and not a mouthful of meat and no vegetables to supplement their meager fare.

CULTIVATION OF FISH.

It is asserted, and we dare say truly, that millions of acres we possess of salt and fresh water, properly stocked with fish, would yield a greater profit than the same area of our most fertile soils in vegetables, grass, and grain. Last year the appropriation for the support of the New York Fishery Commission was vetoed by the Governor, and it is feared on this account that the Legislature will not renew it. We think if it does not, it will be a great misfortune to the public. Few Commissions have been as beneficial as this. It has not only restocked many of our bays, rivers, and lakes with their original, valuable and delicious finny tribes, but it has also introduced several kinds among them from distant parts of the country, as well as some from abroad.

The property for hatching and breeding has cost the State about $50,000, and if neglected now will go to ruin. If kept up in active use it may soon add fifty times the cost to the wealth of the country in the production of fish. Our people, especially in the interior, eat too much meat. To vary this with fish would be much more healthy for them, to say nothing of the luxury and variety they would add to their diet. Salmon, shad, sheep's-head, Spanish mackerel, lobsters, oysters, soft crabs and clams from salt water; also the most delicious of all, the white fish, the Mackinaw and smaller trout of the fresh waters may be produced so cheaply that the poorest people could afford to purchase them for their tables. Now they are usually so dear that it requires a pretty well-filled purse to indulge in any but the medium or inferior sorts.

TO RURAL SUBSCRIBERS.

Our old readers will pardon us for stating to our new readers that we always reserve the right of commencing and of discontinuing our Free Seed and Plant Distribution whenever we choose; that they are in no sense premiums, and that our aim through them is, as a first consideration, to introduce new and superior varieties. A reference to those which we have distributed during the past four years will show that in this we have met with a good share of success, and it is exceedingly gratifying to the Rural that such is the case. We have been told by several new subscribers of late, who were complaining they had not received the seeds, that they "subscribed to get the seeds!" May we be excused for saying we do not value such subscribers, and that they had better wait until our seeds are offered for sale by seedsmen in general, at the usual price of well-known kinds.

Every one of our subscribers who has applied; who has sent his share of the postage: who has plainly written his name or address, will have received the seeds of our present distribution in a few days, unless it may be owing to mistakes in our office or irregularities of the postoffices, and we presume we shall have enough left to supply all exceptions of this kind. Many of our good friends write to thank us for seeds sent. We thank them for their consideration. But, again, we beg to say that we are entitled to no thanks. We fancy that we are trying to do a good work for the agricultural and horticultural interests of our country. In this our subscribers are aiding us—they give us the *means* to do it. The obligation is at least mutual, or, if not, the balance of thanks is due from us to them.

THE PRESIDENT AND THE FARMERS.

Farmers, irrespective of political bias, have good reason, we trust, to congratulate themselves on Mr. Garfield's accession to the Presidential chair. He has the reputation of being a thorough and practical farmer, which his well cultivated acres in Ohio would seem to justify. Believing him to be in sympathy with agriculturists everywhere, we shall hope for his hearty co-operation in whatever may advance the great agricultural interests of the country, and the position which he now occupies will enable him to wield a great and lasting influence in promoting these interests. In his inaugural address he says: "The interests of agriculture should have more attention from the Government than they have yet received. As the Government lights our coasts for the protection of mariners and the benefit of commerce, so it should give to the tillers of the soil the best lights of practical science and experience." From these words we may infer that he is contemplating some practical solution of the problem concerning a Cabinet position for the Commissioner of Agriculture.

The Department of Agriculture, though stinted in its appropriations, has been, under Gen. Le Duc, of great value to the material development of the country, and when elevated to equal rank and privilege with the other Departments, its value may be increased many-fold.

We believe that President Garfield realizes the fact that this great branch of our productive forces has been ignored, or treated in a grudging, half-hearted way, as if it were a disgrace rather than an honor to place the Agricultural Department on an equal footing with the other Departments. The Government seems to be ashamed to recognize agriculture as a great foundation of wealth and power, although it cannot get rid of the fact that, as one has said, "the *nation* dwells largely in the cottages and farm houses of the country." If the President wishes to win the grateful recognition of the great community of farmers, he will take the present opportunity to use his power to increase the capacity and usefulness of the Department of Agriculture.

SOME NOTABLE HORSE SALES.

Last week a large number of horsemen from all parts of the country assembled in this city to attend a couple of large sales of horses many of which were distinguished either for their own performances or those of their ancestors or relatives. On Tuesday, March 15th, 36 imported thoroughbred horses were sold under the auspices of the American Horse Exchange, an institution lately established here under the direction of Wm. H. Vanderbilt and several other wealthy lovers of horse-flesh for the honest sale here of imported and home-raised stock, and for the exportation of American horses to various foreign countries in which there may be a market for them. The sale included 36 horses, two only of which—Matchless by Stockwell and Nonpareil by Kingston—brought four figures—$1,000 and $1,025, respectively. From these the prices ran down to $30, the whole 39 bringing only $12,020, an average of $333.88. Much disappointment was felt by the importers at the low prices, the offsprings of Derby winners having in several cases been sold for less than the price good cart horses often fetch. It is evident that the day has gone by when the mere fact that an animal was imported gave it a fictitious value.

On the three following days Messrs. P. C. Kellogg & Co., held their annual combination sales of roadsters at the American Institute Building. In view of the high reputation of some of the trotters sold, the prices here, too, were somewhat disappointing. Fifty-one horses were sold on Wednesday for $21,730—an average of $426. On Thursday 39 were sold for $8,630—an average of $265, and on Friday 47 were auctioned off for $17,775, an average of $378. The entire sale included 137 horses, colts and fillies, which sold for $48,135—an average of a trifle over $351. On Friday, 14 Shetland ponies went under the hammer at an average price of $110 per head, the highest figure being $265 for a beautiful, little stallion.

On Thursday, March 3rd, the sale and dispersion of the Blink Bonny stud occurred in England. This was founded and overlooked for 18 years by Mr. W. I'Anson, and it offered for sale fourteen brood mares and eight yearlings. The former brought the aggregate sum of $31,620, an average of $2,258, and the latter a total of $17,590, an average of $2,795. The highest-priced animal in each lot—the mare, Pearl, $10,925 and the colt Pero Gomez, $2,180—were bought, it is reported, for Mr. Pierre Lorillard, and will be brought to this country. For prime horses there is a good market everywhere; but inferior animals, however loudly they may be puffed, are likely to go for a song.

BREVITIES.

Ex-Gov. Furnas (Nebraska) tells us in another column that, unless we have a late Spring, every indication favors bounteous crops this year.

With all thy getting, get wisdom, which means an unabridged and illustrated dictionary. Next to the Bible, it is the most important head-piece a family can possess, that can be procured with *money*.

Professor Tracy (Detroit, Mich.), writes us that he found, last season, a difference of 400 per cent. in the marketable product of two lots of onion seed of the same variety sowed side by side and thinned to the same number of plants in the row.

President Garfield is the only President who has been inaugurated in the presence of his mother. Happy man! Most of us meet with our greatest successes only after the hearts that would have enjoyed them most are moldering in the dust.

Clouds as Cows.—In the Aryan mythology the clouds were supposed to be cows, whose teeming udders not only refreshed, but replenished the thirsty and weary earth. In Germany the common superstition is that a fire kindled by lightning can only be extinguished by cows' milk, hair, etc., meaning that heavenly fire can only be quenched by the waters of heaven; that is, rain and dew from the clouds.

The visible supply of wheat is now comparatively small, and owing to this fact and an increased European demand prices are stiffening. The obstructions to railroad traffic in the Northwest owing to the heavy snow storms have prevented the movement of wheat from the interior in some sections for weeks. The tendency of prices at present is upward; but the high figures that ruled at this time last year, owing to the manipulations of the syndicate that formed the wheat corner, cannot be expected. The heavy snows in the West and Northwest, it is expected, will cause a late Spring and a late opening of lake navigation is also feared.

At last, after many disappointments and not a little discouragement to the managers, the first million dollars has been subscribed in aid of the World's Fair to be held in this city in 1883. Had not this first installment been completed last week, it is not improbable the undertaking would have collapsed through lack of encouragement from the general public; at any rate, it is more than likely that Gen. Grant would have resigned the presidency of the enterprise, which, under the circumstances, would have been a severe blow to it. As it is, he may find it convenient or necessary to do so, in view of his other engagements, but the project is now considered to be on the turnpike road to success.

The wheat farmers of England, according to late advices, are greatly discouraged at the competition with this country and the unfavorable weather which has of late seriously impeded agricultural work. So many farms all over the country are now tenantless that even should the weather henceforth prove propitious, a considerable diminution in farm crops seems inevitable. A single landlord in Essex, one of the leading wheat-producing counties, has over 10,000 acres of land for which he can find no cultivators, and a great deal of slovenly farming is loudly complained of. Land owners are still making deductions in rent to their leasehold tenants, and are ready to rent their unoccupied lands at considerably lower figures than they were formerly willing to accept. On this account and because, as a rule, they are relaxing their former strictness, with regard to the terms of leases, a considerable increase of tenants is expected at Michaelmas.

One of the severest and most widespread storms of the season formed in the Gulf of Mexico and Southern Texas on Friday last and moved rapidly northeastward, spreading over the entire country east of the Missouri River. In its passage nine inches of rain are reported to have fallen at Atlanta, Georgia, five inches at Augusta, while the downpour was correspondingly heavy all over Northern Georgia and Western Tennessee. Several freshets have done a great deal of damage in both States. On Saturday the storm swept over the Eastern, Middle and Northwestern States, and in the last section it proved the severest storm of the Winter, from twelve to eighteen inches of snow having fallen in Indiana, Illinois, Iowa, Missouri and over the upper lakes. This, certainly seems to have been one of Vennor's lucky "hits," as he had foretold one of the heaviest storms of the season on the 19th or 20th of March. Winter really ended with the vernal equinox on the 20th, regardless of the Spring of poets, almanacs or popular fancy, and to-day here is sunny and cheerful enough for the opening Spring.

Literary Miscellany.

THE LUCKY HORSESHOE.

A FARMER traveling with his load
Picked up a horseshoe in the road,
And nailed it fast to his barn door,
That luck might down upon him pour;
That every blessing known in life
Might crown his homestead and his wife,
And never any kind of harm
Descend upon his growing farm.

But dire ill-fortune soon began
To visit the astounded man.
His hens declined to lay their eggs;
His bacon tumbled from the pegs,
And rats devoured the fallen legs;
His corn, that never failed before,
Mildewed and rotted on the floor.
His grass refused to end in hay;
His cattle died or went astray;
In short, all moved the crooked way.

Next Spring a great drought baked the sod,
And roasted every pea in pod;
The beans declared they could not grow
So long as nature acted so;
Redundant insects reared their brood
To starve for lack of juicy food;
The staves from barrel sides went off
As if they had the whooping-cough,
And nothing of the useful kind
To hold together felt inclined;
In short, it was no use to try
While all the land was in a fry.

One morn, demoralized with grief,
The farmer clamored for relief;
And prayed right hard to understand
What witchcraft now possessed his land;
Why house and farm in misery grew
Since he nailed up that "lucky" shoe?

While thus dismayed o'er matters wrong
An old man chanced to trudge along,
To whom he told, with wormwood tears,
How his affairs were in arrears;
And what a desperate state of things
A picked-up horseshoe sometimes brings.

The stranger asked to see the shoe
The farmer brought it into view:
But when the old man raised his head,
He laughed outright, and quickly said:
"No wonder skies upon you frown—
You've nailed the horseshoe upside down!
Just turn it round, and soon you'll see
How you and Fortune will agree."

The farmer turned the horseshoe round,
And showers began to swell the ground;
The sunshine laughed among his grain,
And heaps on heaps piled up the wain;
The loft his hay could barely hold,
His cattle did as they were told;
His fruit trees needed sturdy props
To hold the gathering apple crops;
His turnip and potato fields
Astonished all men by their yields;
Folks never saw such ears of corn
As in his smiling hills were born;
His barn was full of bursting bins—
His wife presented him with twins;
His neighbors marveled more and more
To see his increase in his store,
And now the merry farmer sings,
"There are two ways of doing things;
And when for good luck you would pray,
Nail up your horseshoe the *right* way."

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

(Continued from page 198.)

CHAPTER VIII.

A MISFORTUNE WHICH IN THE CITY OF GOODWILLTOMEN IS NO MISFORTUNE.

The gentleman who had conducted me to Mr. Autleman's gave me the directions necessary to find my way back; but I found that the hour for closing business was already at hand, and that I would not be able to reach my friend Mr. Flyter's store before he would have left for home. So I resolved to return to my hotel.

All the numbered streets crossed the avenues at right angles, and as the avenues were also numbered, it was not difficult for even a stranger to make his way about the city. I calculated that my hotel was about eight miles off, and for the purpose of the better observation of objects of interest, I resolved to make a portion of the distance at least, on foot.

The same general features of the city which I have already described were presented to me as I passed along. I was surprised to find so much uniformity in the different parts of the city; for I naturally supposed that some localities would be specially devoted to the homes of the poor, and that others would contain the mansions of the rich; that some streets would be the brilliant thoroughfares, and others little more than obscure passage-ways, where low groggeries might flourish and the pawn-broker and the second-hand clothier display their dingy wares; that bankers and brokers, iron mongers, produce dealers, commission men, and other distinct branches of trade would each be found congregated in certain localities. And though this was to some extent true of the business interests, yet, so far as my observation went, I could not discover that there was anything to distinguish the fashionable from the unfashionable, the high from the low, the rich from the poor, either in locality, the style of the houses, or the dress and general appearance of the people themselves.

I passed three of the parks which I have already described, in the course of my walk. I observed that they each contained the area of sixteen blocks, being two blocks wide by eight long. I observed also that at a distance of eight squares from every side of a park another park began. Thus each park was the center of a parallelogram of a hundred and forty-four squares, being four squares wide on every side, which constituted a section or ward of the city. Each park, though free to all, was especially the pleasure-ground of the people of the ward in which it was located. In many other respects the people of each ward were bound together by a community of interest. But this will better appear further on in my narrative.

I observed that the sides of the squares which faced the parks were entirely devoted to dwelling-houses and, unlike the residences on other streets, every one of which had a considerable plot of ground around it, they were built close together, and in a somewhat plainer style than the other dwellings. Hence I conjectured that these might be the habitations of the poorer class, who, as a sort of balancing of conditions, were accorded the right of occupying the sites about the parks; being thus enabled to look out in common upon the combined beauties of art and nature, which their circumstances did not permit them to enjoy as a part of their individual homes.

Having sauntered along for about an hour and a half, I began to grow somewhat leg-weary as well as hungry, for it was now sometime past the hour of noon. As well to rest myself as to regale my inner man, I stepped into a restaurant which presented an external appearance of neatness that was most inviting.

To my surprise, I found but one customer present, and he had finished his dinner and was about paying his bill. Some of the waiters were eating and others were sweeping up the crumbs and setting the room in order. From this I conjectured that, unlike the restaurants of my own country where meals are served "at all hours," the regular habits of the people permitted their eating-houses to place exact limits to the duration of their hours for meals. And as it was now but half past one o'clock, it occurred to me that but a small margin was allowed for the many causes which are apt to delay a man's time of eating.

"I am late, sir, I see," I remarked to the head waiter, who looked about as much like a waiter as a dignitary of state in my own country.

"Rather late, sir, but we never turn a man away hungry," he replied with a kindly smile which was a very pleasant thing indeed to see in a waiter under such circumstances.

"I have never yet eaten a dinner in your city, and I am an entire stranger to the customs of the country," I remarked, by way of apology, as he seated me at a table and placed a bill of fare before me.

"Pardon me, sir," said he, with a look of pity which was becoming very familiar as well as quite disagreeable to me, "but you look like a person who has lately gotten up from a bed of sickness."

"Do I?" I rejoined, laughing. "Just bring on some of your substantials and I will show you that I am a true convalescent. I had quite a poor turn this morning but one of your learned doctors cured me almost instantaneously by simply assuring me that I was not sick at all. So to convince you that I am well, reassure myself and vindicate the doctor, please bring me a dish of oysters to start off with."

Oysters!" he exclaimed in surprise.

"Oh! I forgot," said I, "its out of their season isn't it. Well, bring me some roast beef, lamb, or veal, anything substantial, I don't care much what it is; for I didn't make out much of a breakfast this morning, and I am very hungry."

The waiter gave me a look which seemed to imply that he thought some proofs of my sanity would be as much in place as those of my freedom from bodily ailment.

"I beg your pardon'" sir," said he, "but I must confess that these dishes which you mention are altogether new to me."

"Can it be possible," I exclaimed, "that such a common dish as roast beef is unknown in this country? The waiter who served me at breakfast told me that meat was not used in here as an article of diet, but I thought he was joking or else serving his purpose in some way by telling me a professional lie."

"A professional lie!" he repeated, with a look of pity, strongly tinctured with contempt. "Why sir, there is not a waiter in the city who would not burn with just indignation at such a charge. I do not quite understand what you mean by a 'professional lie,' but if it is a warping of the truth in any manner; the charge, in this case, certainly is unfounded, and I doubt not would be in any other instance in which it might be preferred against any waiter in the city."

This was spoken with the noble dignity that a virtuous man is inclined to repel any insinuation against his integrity, and though it appeared to me only the extravagant language of an enthusiastic defender of his guild, I could not feel but that I was justly rebuked for having spoken so uncharitably of one whose character was unknown to me. I therefore expressed my regret at having by word or thought done injury to his fellow-waiter's reputation. I said that during my brief stay in the city I had lived in such a continous state of wonderment at the marvelous advancement of its people in everything that was worthy of praise, that it might not be so strange as it at first appeared to me, if among them not a single individual could be found, who would stoop to tell a lie.

"I hope sir," said he," that you do not come from a country where falsehood is so common that general truthfulness would be regarded as an occasion for wonderment, and a thing to be esteemed worthy of praise."

I affected to treat this remark as a joke, and laughed heartily at it. At the same time I apologized for the delay which I was causing him, and requested that I might be served with anything that he might have which was serviceable for a hungry man. To tell the truth, I did not know what reply to make to this home thrust. I did not wish to bring reproach on my country by answering it as truth would compel me to do, and I had too much respect for myself to evade it by falsehood.

The waiter left me, and soon returned with a bowl and spoon and a dish which he called *tique*, a sort of thin pudding, combining the flavor of barley and hominy, but greatly superior to anything of the kind that I had ever eaten. It was in reality made out of a kind of grain which is entirely unknown in my country, but which has such an excellent flavor and is such a complete article of food that its use among this people is universal. Especially at the mid-day meal—which, by the way, is merely a lunch—it is the favorite, and, as a rule, the only dish. I ate heartily of it, and enjoyed it much, though I thought it would have been improved by a richer sauce.

To show my appreciation of the waiter's courtesy in serving me with so much good nature at so late an hour, I put my hand in my pocket to give him a fee, when, to my surprise, I discovered that my purse was not there. I always carried it in my right pants pocket, but not finding it there, I turned to the left, and from the left to the hip, and from the hip to the pockets of my vest, and from these to the pockets of my coat, my hope growing less and my dismay increasing as each pocket was searched in vain.

"I declare," I exclaimed, excitedly, "I have been robbed! Some one has picked my pocket! I surely had my purse with me when I set out this morning. Some skillful thief doubtless secured it in my hurrying to see the doctor. Is there a police station near where I can make known my loss?" I asked the waiter.

My distress and excitement had gathered round me a number of the waiters, and even the proprietor left his dinner to inquire into the cause of my trouble. I expected to be denounced by him as a "dead beat," to be summarily ejected into the street, or to have a policeman summoned to bear me off to justice. Judge of my surprise, therefore, when the proprietor, upon hearing my story, never offered to doubt it, but endeavored in the most kindly manner to allay my distress.

He assured me that I need not feel any uneasiness whatever over my loss. He said that there were finding-offices in every ward of the city where anything which was found was sent, and from which it was reported to every other office in the city. That if I would go to any of the finding-offices I would very likely hear of my purse, and doubtless have it restored to me within an hour after my loss was made known.

I looked at the man in surprise, but recalling my talk with the waiter, I prudently refrained from casting any doubt on the general honesty of the people. Especially, I thought, ought I to rely on the truthfulness and integrity of a community where I myself, though an utter stranger, am treated with so much confidence.

I took off a finger-ring which I wore and offered it to the proprietor of the restaurant as security for my debt till I should be able to pay it. He looked at me as though he were hardly able to comprehend my proposition, and the head waiter whispered something apart to him, the import of which, from the manner in which they regarded me and the few words which I overheard, I judged to be the calling of my mental soundness in question. I again pressed my security upon him, but he politely declined it, assuring me that if the amount were a thousand times as large he would ask no stronger security than my own word.

This speech appeared to me the very marrow of blarney, though I could not conceive what reason there could be, under the circumstances for flattery. I thanked him for the good opinion which he seemed to have of my honesty, and requested him to direct me to the nearest finding office. He replied that they were all closed, their office hours being from eight to twelve in the forenoon, and from six to seven in the evening.

Carefully noting down the address of my trusting acquaintance, I again bent my steps toward my hotel, my mind completely occupied with reflections upon the countless advantages which must accrue to a community whose members are all thoroughly honest and truthful.

CHAPTER IX.

TELEPHONES IN THE CITY GOODWILLTOMEN.

I ARRIVED at my hotel late in the afternoon, having walked the whole distance in a leisurely, observant manner, traversing the whole length of several parks, resting frequently on their rustic seats, and enjoying the rare beauty of their rich and varied scenes.

I found a note awaiting me from Mr. Flyter, in which he expressed his apprehension that some misfortune had befallen me, and requested that I should telephone him at once, if I should return to the hotel.

I told the clerk that I wished to communicate with 1,285, 57th Ave., and asked him with the air of one familiar with such matters to direct me to the telephone. He pointed to a door at the other side of the room, and told me that I would find it there. I passed across and entered a large, well-furnished room which had three rows of telephones extending completely around it. I made known my desire to the young man in attendance, and he directed me to a telephone a little apart from the rest, before which a large easy chair was placed. He took up a funnel-shaped instrument, and placed its large end against the telephone's disk, which it just covered, and spoke through it the address of Mr. Flyter very distinctly. In about half a minute an answer was returned, when he gave the condex—I believe he called it,—into my hand, and told me to apply my mouth to it when I wished to speak, and my ear, when I wished to hear.

I accordingly sat down in the easy chair and introduced my telephonic conversation by inquiring if Mr. Flyter was at home. That gentleman soon made his presence known at the other end of the line. He expressed great relief and happiness at learning of my safety, and showed the kindly interest which he felt in me by frequent exclamations of pleasure or condolence as I recounted to him my experiences since I left his store in the morning. Being unskillful in conversing by telephone, I received most of these exclamations in my mouth instead of my ear, which startled me not a little on several occasions, so that twice the condex nearly dropped from my hand.

Our conversation ended with the proposition from Mr. Flyter that I should await his coming in the evening, and accompany him to their social entertainments in the park. He had just finished dinner, he said, and was about to set out for his store, where he would be occupied from six to seven, and would then come to me at my hotel.

While I was engaged at my conversation with Mr. Flyter, several communications came in which were received by the young man in attendance from one telephone, and sent out by another. My curiosity concerning this telephone business was of course, great; for from appearances it was much more extensive than was ever dreamed of in my own country. I, therefore, put several questions to the operator, and learned from him that the telephones which I saw about the room were each connected with a different ward of the city, except the four next me which were connected with the four quarters of the ward I was in. There was one hotel in every ward, and in every hotel there was a telephone room exactly like the one I was in, with a telephone for every ward, and four for the ward in which it was situated. If a person in the twentieth ward wished to communicate with one in the thirtieth, he would go to the telephone office in his ward and direct the operator to "call" the operator of the thirtieth. This was effected by an electric current which, connected with the telephone numbered 20, indicated the telephone with the corresponding number in the office of the thirtieth ward. The operator then connected the telephone numbered 20 with that of the four belonging to his own ward through which communication was desired, and the person in the twentieth ward could talk to his friend in the thirtieth as readily as though he were in the same ward. If the communication was short and of little importance, the operator himself received and transmitted it.

What surprised me more than anything else about these telephones was the privacy with which messages could be sent. Though there was a telephone in every house in the city, yet a conversation could be carried on by two friends however widely separated, with as much secrecy as if they were sitting by the same fireside.

The manner of insulating any particular house was explained to me by the operator, and he said that the operation was most complete and easily accomplished, but I confess that I could not get a clear enough idea of it to explain it intelligibly.

I told this very pleasant young man of my misfortune in losing my purse, and requested that his charge for the use of the telephone might be put in with my hotel bill, which I hoped to be able to pay by the recovery of my purse. But he replied that there was never any charge made for the use of telephones in the city. They were for the convenience of the public, and were free to all. As to my purse, he said that he would be able to get me information about it in a few minutes, when the finding-offices should open.

I accordingly retired to await the hour of six, which was close at hand.

Shortly after that hour had struck I again entered the telephone office, and was greeted by the operator with the very agreeable information that my purse had been found and was awaiting my demand. He had telephoned the finding office of the ward, and had learned from it that a queer looking purse with queer looking coin and paper money in it had been reported by the manager of Philigomotor number 76. It had been found under the seats when the car had reached its terminus, and the manager of the car, remembering that an odd looking stranger had been severely jostled during the trip, conjectured that the purse might have escaped from his pocket on that occasion, and had accordingly returned it to the finding office of the ward in which the stranger's mishap had occurred. This was three wards away, but the operator gave me the directions necessary for finding the office in question, and within half an hour I had returned to the hotel with my purse in my pocket.

I offered to pay the director of the office in which my purse had been found for the service which had been rendered me, but he said that the finding offices were a city institution, and were free to all. I then inquired for the conductor or manager of philigomotor No. 76, that I might reward him for his honesty. But the man regarded me with the air of superior complaisance with which a good natured inhabitant of the town is apt to look upon a green rustic, and politely informed me that it was not the conductor who had found the purse, but the boy whose business it was to sweep out the cars at the end of the line. But even he would feel as much degraded by the offer of a reward for such a simple service, as any gentleman would for restoring to a lady a lost handkerchief.

MAGAZINES FOR MARCH.

THE Domestic Monthly; Atlantic Monthly; Scribner's Monthly; The American Naturalist; Lippincott's Magazine; North American Review; Godey's Lady's Book; St. Nicholas for March; Appleton's Magazine; Phrenological Journal.

The above periodicals have been received. The demand for space having caused delay in notice, we briefly mention receipt, with the comment of usual merit in their production.

NEW PUBLICATIONS.

Counsel to Parents, on the Moral Education of Their Children. By DR. ELIZABETH BLACKWELL New York: Brentano's Literary Emporium. Cloth $1.00; Paper cover, 50 cents.

The author of this volume enjoys a wide reputation, so much so that the mere mention of her name in connection with a literary production serves to recommend a perusal.

Forcible argument is used to inspire parents with a sense of duty in this important field of education. Parents having the subject of true health and happiness of their children, and the good of all humanity at heart, will profit by the counsel

and suggestions from one who has studied and proved the truth of her assertions.

A third edition of this little book shows an extended interest.

A Book of Rhymes and Tunes. By MARGARET PEARMAIN OSGOOD. Translations by LOUISA T. CRAGIN. Boston: Oliver Ditson & Co. Price, $1.50.

This is a true household singing book, acceptable not only to mothers and children, but to Kindergartens, and to all of the new faith, who believe in making school children happy. There are about a hundred songs, many of them retaining the original foreign words, but also furnished with special translations for this book. Its value grows upon one as the leaves are turned. Considerable skill is evinced in the selections, showing the tact of true women who remember how they felt as children. A bright boy or girl does not fancy the milk-and-water productions that are often put together for the "dear children." Neither is anything stately or over dignified acceptable. The "lullabies" are such as mothers and older sisters will admire to sing; the nonsense songs are worthy of the writers in St. Nicholas, (no higher praise is needed) and the few charming legends and romances from the German will please everbody. A large proportion of the songs have the original foreign as well as the English words preserved; a fact that may commend the book to many cultivated households.

Romola. By "GEORGE ELIOT." New York City: American Book Exchange.

This is an exceedingly cheap reprint of one of the best works of the late Geo. Eliot. Though the paper is necessarily poor to admit of its being sold at so low a price, the print is clear and the appearance of the cover is quite pretty and inviting. It fills a want in the catalogue of good, cheap works, since the higher priced editions are not always within reach of everyone. The character of the work needs no comment; the author's name is enough to recommend it to all.

The Servant Girl Question. By HARRIET PRESCOTT SPOFFORD. Boston: Houghton, Mifflin & Co. Price, $1.25.

This much vexed question is embodied in book form. The author impartially considers the subject showing the rights of mistress and servant in a clear light. All participants in household management are criticised commendably and otherwise.

Madame Bovary, BY GUSTAVE FLAUBET. TRANSLATED BY JOHN STERLING. Paper cover.—Price 75 cents. Philadelphia: T. B. Peterson & Brothers.

This work, interesting as it is as a novel, must also be regarded as a careful study.

BRIC-A-BRAC.

HOW LONG.

A little girl went timidly into a shop the other morning, and asked the shopman how many shoestrings she could get for a penny? "How long do you want them?" he asked. "I want them to keep," was the answer, in a tone of slight surprise.

BABY'S LULLABY.

[As sung by its father while mamma is visiting the neighbors.]

Rock-a-by baby upon the tree-top.
When the wind blows—confound it, do stop.
When the wind blows the cradle will rock,
Jerusalem crickets, what a temper you've got.
When the bough breaks the cradle will fall.
By thunder, you young 'uns do nothing but squall.

Now, baby, go-by; go hush-i-ty—hush:
Shoo, shoo, shooy, hush hush-i-ty—hush;
Go to sleep, my baby, my sweet little pet;
Go to sleep; don't you hear me, I'll spank you, I'll bet,
If you ain't asleep, this minute, now, now, rock-a-by,
Well, hang such a young one, that does nothing but cry.
—Oil City Derrick.

A "SUMMER HORSE."

THE blacksmith shops at the head of Griswold street had scarcely opened their doors the other morning when a colored man appeared at one of them leading an equine which slid and walked and hobbled by turns on the slippery snow. If horses ever live over a hundred years this one had passed that figure. His hair was long, one eye was closed and he had so many limps that it seemed useless to look for a sound leg.

"What I want to know," began the owner after he had taken four turns around a hitching post with the inch rope used as a halter, "am about what it will cost to shoe dis hoss."

"Two dollars," was the prompt reply.

"For de land's sake! but has iron riz up to dat pitch! I'll have to dwell on dat for a few minutes."

He dwelt. He walked around his steed, looked him over carefully, and then said to the smith:

"Now, see hyar. If you war' me wouldn't you sort o' keep dis beast fur a Summer hoss, an do your Winter haulin' on a hand-sled?"

"I would."

"Dat's what I war' finkin' 'bout, I guess I save him over till April and call myself a hoss frew de Winter. Seems like 'stravagance to get butes fur me 'an shoes fur him all to once. Hold up dar', Philander—none o' you pullin' up hitchin'-posts 'round yere!"—Detroit Free Press.

Beneath a shady tree they sat,
He held her hand, she held his hat;
I held my breath and lay right flat,
They kissed, I saw them do it.
He held that kissing was no crime,
She held her head up every time,
I held my peace and wrote this rhyme,
While they thought no one knew it.
—Shenandoah News.

NOVEL WAY TO SECURE A BED.

IT was at the time of the country fair and the village was crowded.

A man carrying two round bundles carefully tied up knocks at the door of an inn and asks for a room. They tell him the best they can give him is a room with two beds, one of which is already occupied. Under the circumstances he is obliged to accept the vacant bed. The occupant of the other is fast asleep and snoring soundly when he enters the room. He takes him by the shoulder, wakes him rudely, and asks:

"Are there any rats or mice here?"

"I believe not, sir."

"All the better, for they gnaw everything they can find. I have here, said the newcomer, pointing to the two round bundles, "the heads of two persons that I executed this morning, that I am taking to Paris, and you understand that if any rats or mice—

"Heads of persons!" said the other turning pale.

Five minutes later the possessor of these horrible trophies was alone in the chamber, where he slept comfortable until the morning.

The bundles he had were merely two watermelons.

For Women.

CONDUCTED BY MISS RAY CLARK.

AFTERGLOW.

GRANDMOTHER paces with stately tread
Forward and back through the quaint old room,
Out of the firelight, dancing and red,
Into the gathering dusk and gloom;
Forward and back, in her silken dress
With its falling ruffles of frost-like lace;
A look of the deepest tenderness
In the faded lines of her fine old face.

Warm on her breast in his red night-gown
Like a scarlet lily the baby lies,
While softly the tired lids droop down
Over the little sleepy eyes.
Grandmother sings to him sweet and low,
And memories come with the cradle-song
Of the days when she sang it long ago,
When her life was young and her heart was strong.

Grandmother's children have left her now;
The large old house is a shadowed place;
But shining out in the sunset glow
Of her life, like a star, comes the baby's face.
He lies where of old his father lay;
Softly she sings him the same sweet strain;
Till the years intervening are swept away,
And the joy of life's morning is hers again.

Grandmother's gray head is bending low
Why one;
The steps of her pathway are few to go;
The baby's journey is just begun.
Yet the rosy dawn of his childish love
Brightens the evening that else were dim;
And in after years, from the home above,
The light of her blessing will rest on him.

MRS. HAYES.

BERTHA A. WINKLER.

IT will not be denied that, in point of moral excellence, the late mistress of the White House is by far the most superior of any of her more recent predecessors, and therefore we confess a feeling of personal pride in the universal respect entertained for this first true representative of the American woman. Without entering into any details of her life, already so well known as "the light shining before the world," we will merely allude to some distinguishing traits during her four years at the Capitol; knowing that there, by her noble conduct, she first struck the keynote of the nations love.

It was something to enter the Capitol and take possession of hotly-contested rights under the angry glare of opposition; but it was more to plan in the midst of that confusion, a course of conduct at once so new to Washington Society and so daringly noble under the circumstances. Her abiding faith in the power of right and in the American people who recognized and sustained that power, nerved her to the task, and she was not deceived. It was something for the unpretending new mother of the country to find the brilliant gayety of Washington society arrayed against her, but it was more to set about her task in quiet determination supplanting exaggerated fashion and rivaling extravagance with her own sweet simple elegance, captivating the heart as well as the eye; appealing to the good sense of the majority as well as the taste of the artist. She did it for love of the true and the honor of her sex of whom not one truly American but that is ready to acknowledge her influence in that foreign-leavened society as truly wholesome. It was something to play the hostess to the representatives of European power for she knew they were no mild critics of another nation's failings; but it was infinitely more to brave Europe's sneer for conscience sake for she knew the mighty were not always the just and offence might easily be taken where only good was intended. But she resolved that the proud independence of America should be upheld by her in the face of all nations—that none of her principles should yield to etiquette and none of her virtues to a customary vice. It mattered not to her who ridiculed and who admired, her strength lay in the consciousness of duties faithfully discharged and honors worthily borne.

Too conscientious in all she did to fear criticism, she disarmed it before its attack by going straight onward doing right to the best of her knowledge and heeding adverse comments only where they conveyed a suggestion for improvement. Her noble espousal of every cause calculated to benefit and advance mankind, won the esteem of the enlightened and brought even old Conservatism to consider new departures with respect. Bound by no irksome conventionalities, she removed sanctioned abuses with the firm and gentle hand which only encountered opposition to change it into hearty co-operation. It was this firm, decided stand on all important questions, this fearless independence throughout, which appealed so powerfully to the kindred spirit of her free country and laid the foundation to her popularity. She was the mirror of the nation, reflecting throughout her conduct its resolute spirit, its tenacity of purpose and its peculiar ease and self-command in perfect freedom. She is the prototype of what woman will be in the free exercise of all her faculties and in her proper station of an honored, active member of the world's shareholders.

That her strong character and intellect does not conflict with her womanliness is evident from the universal praise which has been bestowed upon her as the "eminently womanly woman at the White House." And that she is not an unwelcome type of womanhood is also evident from the warm demonstrations with which she has been received in all parts of the Union.

The Americans are not celebrated as an adulating, homage-paying people; but they are appreciative and know how to give honor where honor is due. The President's wife may not have received the knee-homage of titled courtiers, but the warm hand-shake of a nation of lords is something far more valuable, and the sincere expressions of regard and admiration from lips unused to flatter, infinitely dearer. Her departure from the White House leaves no vacancy in our hearts. Our remembrance of her does not cease with her withdrawal from public life. Her farewell betokened that there was a welcome closer into our midst—honored, beloved, so long as memory endures and a spark of truth and honor is sheltered in the American heart.

THE HORTICULTURAL LEECH.

ANNIE L. JACK.

THEY come to you in varied guise and you are not able to avoid contact with them in daily life. We all know the leech that admires our house-plants, and begs for "one little slip" of the choicest of our treasures without offering anything in return. I have seen such people in my flower garden stoop down over a flower-bed and pick every seed they could find from a rare strain of pansy that had cost me dear; I have known another to break off cuttings, and with the remark, "I haven't any of this or that," coolly ask for a piece of newspaper in which to wrap their booty. It is just such people who borrow the RURAL, and if they return it at all do so in a soiled or torn condition. If you ask them to subscribe—they "can't afford it" but treat themselves to luxuries that some RURAL subscribers do without.

The horticultural leech crosses your orchard and reads the labels on your newly-planted trees; he carries a knife, and of course it is not stealing, but he takes off a few grafts of sorts you may have imported at some expense, and by such means, gets these varieties for nothing.

When you are pruning your grapes he is sure to be along, and "What a fine lot of wood you have," he was just wanting some cuttings. You tell him you have year-old plants for sale cheap, but he does not listen to the voice of the charmer, and goes home laden with spoil; indeed, you may think yourself well off if he does not ask for your horse and cart to carry them.

If you are at all enterprising; given to experiments; successful in raising any unusual crop, or, are known to be able to use your pen on these subjects the leech comes in another form. Here is a copy of a letter received to-day that explains my meaning:—"Dear Sir: I want information regarding a bean that I have been told you raise for pickling; what do you call it? where could I get the seed? what is the price? how much does it take to plant an acre? what is the probable yield in bushels, pods included? when is the time to pull them? do they require rich land? and what is the name and address of the firm that does the pickling?" All this without *even a stamp to pay postage*, and, as we do *not* run any kind of a horticultural paper in which to answer questions, I can safely class it under the heading of this article.

There are many other ways in which the "leech" makes himself known, but these I have mentioned are a few of the most annoying.

A TRAVELING COMPANION.

A VERY convenient article for a lady is a needle-book, pincushion, thimble, thread and scissors-case combined.

Take a strip of either black French kid, or enameled cloth eight inches long, and four and a half inches wide, and cut it with one end square, and the other end rounded like a diary cover; cut a lining to it of some bright colored fabric, either silk or cashmere and baste it smoothly close to the edge; cut a strip of old knitting, either some underwear, or hose just twelve inches long, and four and a-half wide, roll it tight and sew the edge down so it cannot get loose, then cut a place in the side of the roll just the size of your thimble; make a bag of the same material as the lining and fit into the thimble-case, cover the ends of the roll with the same cloth, working around the ends and those of the thimble-case a firm buttonhole-stitch. On the outside make some little bags hemmed nicely at the top, and baste them on to the lining close at the edge; take a bit of pasteboard and cut out a scissors-case just large enough to hold your scissors, cover it with cloth like the lining and blind-stitch it on to the roll. Make a case large enough for your penknife and put on the other side of the thimble-case. Cut out some leaves of fine cashmere or flannel and buttonhole-stitch the edge for needles; some buttonhole-stitched loops will hold your stiletto and tweezers. Bind the cover with ribbon or silk and sew it on the roll, right where the seam of the cover to the cushion comes; roll it up and have a bit of elastic or cord fastened to the center of the round end, to pass over the end to hold it firmly in place. It is a neat, convenient, and useful article, either for one's own use, or for a present to a friend.

Everything is compact and safe; pins, needles, knife, scissors, thimble, thread and all; and the whole outlay, even if you get French kid, is not over thirty cents, aside from your own work. You can put as many fancy stitches in the work as you please and have time for. GRANDMOTHER.

ELOQUENCE.

THE account of Booth's recital of the Lord's Prayer in your issue of the 19th inst., reminds me of a recital of the same matter by Miss C. P. Brooks, daughter of the late Gen. M. Brooks, of Livingston County, N. Y. Miss Brooks lost her hearing at the age of four years, consequently oral speech was early forgotten. She was educated at the Hartford Asylum under the superintendence of the Rev. T. H. Gallaudet, and after spending a few years at home she returned to Hartford and became a teacher in that institution. She was well educated in the common branches of English, was possessed of a splendid physique, rather over the average size, features faultless when at rest, but so extremely mobile as to nearly express her most secret thoughts.

Visiting a few friends she was asked to repeat the Lord's Prayer in the language of the Hartford Institution. She did not kneel like Mr. Booth, for it would have been impossible for her to have done so perfect justice to the occasion in that attitude. She stood before her audience and every motion of her limbs, every glance of her eye, and every expression of her countenance was the most perfect exhibition of an eloquence of the most exalted kind. At its conclusion, all sat speechless with astonishment, as though it were sacrilege to break the spell with the natural voice. S. B. PECK.

EVERY-DAY NOTES.—NO. 1.

"I KNOW not why it is," said a man who had been brought up under the old-fashioned rule for governing children, "but the times that I remember my parents with the warmest affection are the times when I ought to have been punished, and they knew it, but for some unexplained reason let me off. It may be that the reserve that our parents maintained towards us made us appreciate it when we saw a little human weakness manifest itself in them.

I never felt so much like exerting myself to be good as I did when I was with Aunt Mary, and she always thought everything I did was just right. No matter what unthinking mischief I had done, she always had some gentle excuse for me. The memory of her unceasing kindness warms me now, when I remember her, as nothing else does."

Children are so unlike, that where gentleness will answer with some dispositions, firmness and even severity are needed with others. Parents often fail to win their children's hearts—although seeking with the best intentions—beause they fail to read their natures correctly. B. C. D.

CORRESPONDENT'S CORNER.

MISS RAY CLARK:—Will you please translate the following French words into English; that is tell me what they mean?

"Soyez fidele et constante, toujours aimable, et prudente." "VOTRE AMI DEVOUE."

By answering as soon as possible through the RURAL you will oblige, MIZPAH.

Translation of above is as follows:

Be faithful and constant; always loving and prudent. Your devoted Friend, R. C.

Use Hop Bitters once and you will use no other medicine. Test it.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

JESSIE SEABRIGHT'S SCRAP JOURNAL.

MAY MAPLE.

FEB. 19, 18—: For several weeks John has been complaining of great pain in his elbow. We thought at first it might be a sprain; but when all remedies for sprains failed, we concluded that the disease must be inflammatory rheumatism. Several dollars were paid to the village doctor for liniments, but with no better success; the arm remained badly swollen and pained him constantly. As a last resort I suggested a poultice of grated carrots, knowing that it had been a source of great relief when suffering untold agonies from a felon. The poultice was applied, and that night he had a a good night's rest for the first time in a month. At the end of a week the poultice was dismissed and the arm pronounced well.

For a felon we now use a part of a lemon. If applied in season it will "kill it" in six hours, and thus save a great deal of suffering.

Several months ago I dined with Mrs. L——, who resides at the village, and for dessert she had oat-meal mush. It was an entirely new dish to me, but I liked it exceedingly well, and on my return I stopped at the grocery and purchased a small package for trial. The result is, oat-meal mush, with sugar and cream, has quite taken the place of rice and steam puddings for dessert at our dinner-table. And now the great wonder is that it is used so little by farmers. In all my various wanderings east or north I have never seen a dish of oat-meal upon a farmer's table, and yet I see no reason why it should not belong to the farmer's bill-of-fare just as much as corn-meal.

Occasionally a neighbor comes in to borrow a loaf of "salt-rising" bread, saying she has "lost her luck" in making good light bread, and wonders why it is that some people never

have poor bread while it is a common diet with others. If one has reasonably good flour and a good oven, it is quite unnecessary to have poor bread, provided no biscuit-dough or pie-crust has been put into the flour barrel for safe keeping from one baking to another; for, as "a little leaven leaveneth the whole lump," so will a little piece of dough sour a large quantity of flour, and this is the reason why many a housewife "loses her luck" in bread-making. To make the rising, I put a half-teaspoonful each of soda and salt into an earthen bowl and then fill the dish half full of boiling water; when this has cooled till the finger can be borne in it without scalding, stir in flour to make a thick batter. This is kept warm by putting it into a kettle of warm—not hot—water. The dish, which lacked nearly or quite an inch of being full at first, should be filled to the brim in from six to eight hours with light, foamy "emptyings," or "rising." To make three good loaves, I use two quarts of warm milk or warm water, for the wetting. I make a hole in the flour, which in Winter I often warm, and put in the wetting first and then the rising, stirring in enough of the flour to make a stiff batter; cover well with flour; set in a warm place to rise for an hour; then mix into loaves and let them rise three-fourths of an hour. Bake in a moderately hot oven from 45 to 60 minutes. Of course, the housekeeper must use her own judgment as regards baking. Some ovens bake much more quickly than others; sometimes the wood is slow to burn, and then more time is required. Old cooks scarcely need directions, but many a young matron needs the plainest demonstrations, and some time in the far-off future Alicia may find this Scrap Journal of as much importance to her happiness and comfort as a mine of gold.

POUND CAKE.

CHIEF COOK.

POUND cake is so called because it is made of a pound of butter, a pound of sugar, a pound of eggs and a pound of flour. There should be absolutely nothing else in it, all flavor is a damage, whether in the cake or the icing. Let the butter be just soft enough to beat easily, but beware of the slightest approach to oiliness. Use pulverized sugar only. Break the eggs into a basin, ready for instant use, and sift the flour. When all this is done, begin by putting the butter and sugar into a basin, and with a large, heavy tinned, iron spoon beat the two till perfectly homogeneous. At once add all the eggs, and if you are a woman beat till you are tired; then call your stoutest help and let her tire herself out, and then tire yourself over again thoroughly. When this is done add the flour and mix it in as quickly and as lightly as possible. You now have a perfect pound cake batter. Butter the sides of a pan, cut a sheet of letter paper to fit in the bottom; pour in the batter and bake at once. Try with a clean splinter, and when it comes out perfectly clean from doughiness it is done. Lay a plate over the cake; turn both together upside down; lift off the pan, let cool, and you will have a cake perfectly light in every part.

To Ice a Pound Cake.

Beat well together till pretty dry, the whites of five eggs; then add white, pulverized sugar a little at a time, till you have put in one pound, beating all the time. Coat the cake all over the top and sides with this for the first coat, using a broad case-knife. Set in a cool oven till dry, then apply a second coat thinned slightly with a little rose-water; when this is dried in the oven, it is ready for ornamentation. Make a cone of stiff writing paper about five inches long and one and a-half inch broad at the open end. Fill it with icing, and fold down the open end, closing it up entirely. Now with a pair of scissors cut off the point of the cone, till you can squeeze out the icing through the hole in the point by pressure of the thumb on the closed end. Hold the cone point down between the fore and middle finger with the thumb on the closed end. Now use the point of the cone as you would a pencil in drawing; point it to the part of the cake you wish to ornament, but not quite touching it; press the icing out with the thumb, and draw it over the cake at the dictate of your fancy. If you cut the point of the cone square across, you will produce a round thread of icing; if cut like a star, a star like thread will result, and by various ways of cutting off the point you can produce an endless variety of pattern and of all required sizes. When the cone is half emptied fill it up again. If you wish to build the icing in a fence around the edge, or as a castle in the middle, don't build faster than it will set, or your work will fall, but flat work can be rushed through at once. Notice the following essentials for a perfect pound cake:—sweet butter, fresh eggs, pulverized sugar, and the best flour finely sifted, long-continued and thorough beating of the three first, and as little as possible of the last; thorough baking and neat chaste icing; no color in the icing; no ornaments that cannot be eaten, and, above all, no bungling in cutting it up on the table (just prior to serving, not before.) The best cake in the world will not taste well in chunks. To cut a cake well use a knife made for that especial purpose. It has a long extremely thin blade, must be very sharp and used with a steady downward pressure; no drawing out, or the icing will skin off. I have said nothing about how to bake this cake; let no one undertake a pound cake till she can bake other sorts well; it is an art. The oven must be hot enough to set the batter, before it falls; and after that, don't let it be less than a deep brown on the top, when done. Keep a pound cake three days before it is cut. A fresh pound cake is poor stuff.

DISH-WASHING AGAIN.

"WHAT work will the little hands do first for mamma?" I asked, as Bright-eyes tired of her play crept into my lap. "Wash dishes; girls always do that first," said sage seven-year-old from his perch in baby's high chair. The little fellow has gone through his few Summers with his eyes open. First, last and all the time it seems to be the little girl's place to wash the dishes. No wonder she comes to hate it, as nine times out of ten, she will tell you she does, when she is a grown women. She knows, too, that her mother hated it before her, and for the same reason She was proud enough to be allowed to clear away the tea things the *first* time. I doubt if, up to her tenth year, there has ever come to any girl a prouder moment than that when she first heard her mother say to an admiring visitor. "She washes the dishes for me." The change in her feelings comes with the constant—I had almost said everlasting—washing of those same dishes. Morning, noon and night! Night, morning and noon! Noon, night and morning! for, once let the deluded daughter of the house make it manifest that she *can* do the dishes and do them well, and that becomes her task thenceforth. Her mother has been looking forward to this time ever since she was born. "If I only had some one to wash dishes, I could get along with the rest," has been the burden of her thoughts these many years. So the little daughter is chained fast to the treadmill and the mother's hands are free to do something that will *tell*—washing dishes never does. All the beauties of Summer flowers, waving grass and singing birds, may invite the child forth into the sunshine, but the sink standing in the corner with its load of dirty dishes holds her fast, so, mayhap she "slights" the plates and cries over the pots and kettles. Those dreadful pots and kettles! How little she thought in the days when she triumphantly mounted her short self on a stool, to thrust her arms in the dish-pan, that there was but a step between the china and glass of the tea-table and the pots and kettles of the kitchen. Now, I do not mean to say that little girls should not be allowed to wash dishes. They should not only be taught but encouraged to do it, as something necessary to be done. But I do protest against the practice of putting all, or even the bulk, of the family dish-washing on a young girl, thus making drudgery of what might be a not unpleasant task.

ADELINE E. STORY.

BED-QUILTS.

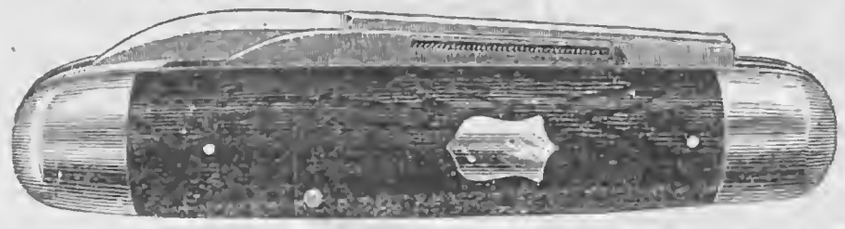
As the days begin to lengthen and the children are at home during the Spring vacation, it is a good time to look after the well-being of the bedding for another year's demand. The odds and ends of chintz and prints can be pieced up by the little girls in chains and blocks, and two useful ends be accomplished—the scraps be worked into use, and the children taught how to sew. A nice way to make a bed-quilt or comfortable is after this wise: make for the center a star of eight diamond pieces, cut out to be two inches long, with squares and half squares for the corners and sides of the star, so that the block when finished will be just square; then cut a strip of print or of bordering and sew around the squares. Next have a row of squares and half-squares pieced into a strip and sew around; then another strip of print, the block-work strip can be made wider, each row to alternate, a strip of patchwork and one of plain, till the quilt is as large as desired. One advantage in piecing in this way is that the quilt can be turned around, there being no top or bottom to it, and the wear will be equalized all around. I never should try new goods to piece up, but really it is economical to work up remnants of garments and turn them to use. I have seen very pretty quilts made by piecing up blocks all stars and setting them together with a sash four inches wide, or alternate blocks of plain. There is no way that a child will learn the use of the needle so easily as in patchwork; there is a fascination in the work that little girls like; besides it seems to establish industrious habits and that is a great item in education. Any employment that will keep a child busy is better than idleness for "Satan always finds mischief for idle hands to do."

GRANDMOTHER.

No Costiveness, Diarrhœa or any bowel complaints where Hop Bitters are used.

Implements and Machinery.

AN OLD FASHIONED HAND FORGED RAZOR STEEL KNIFE.



MAHER & GROSH, 30 Monroe St., Toledo, Ohio, to introduce their brand of cutlery (every blade warranted and replaced **Free** if soft or flawy), will send postpaid, knife like cut, strong blades and ebony handle for 75c.; or with 3 blades, $1. We have 1 blade knife, 25c.; extra heavy 1 blade, 50c.; medium 2 blade, 50c.; extra heavy 2 blade made for hard usage, 75 cts.; **Our Best** 2 blade, every blade tested, $1. Boy's 2 blade, 25c. Ladies' 1 blade, 25c.; 2 blade, 50c.; Gents fine 3 blade $1. **Pruners,** oil temper and tested, $1. Budding knife, 65c.; Hunting knife, $1. Cattle knife, $1.; Sample 6-inch, hand forged, Butcher knife, post paid, 50c. Illustrated list free. Liberal discount to dealers. Ask our Postmaster about us.

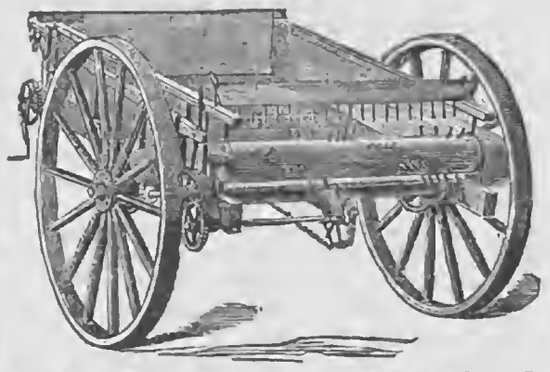
KEMP'S
Manure Spreader,



Pulverizer and Cart Combined

A new Farm Implement equaling the Mowing Machine. For particulars and illustrated circulars address **KEMP & BURPEE M'F'G CO.,** SYRACUSE, N. Y.

MEADOW KING

SULKY HAY RAKE.

This rake is very simple in its plan, and durable in all its parts. It has no ratchets, springs, or friction devices for dumping, which are liable to break or get out of order; and for ease of handling, and for doing good work, is unequaled by any hand dump Sulky Rake in the market. Send for circulars. Address **GREGG & CO.,** Sole Manufacturers, **Trumansburg, N. Y.**
Also Manufacturers of Lawn Mowers, Plows, &c.

White's Patent
Lightning Churn Dash

Will churn cream in from 30 seconds to 3 minutes and new milk in from 3 to 5 minutes, and produces 9 per cent. more nice grained butter than any other dash ever invented. Does not cut the cream, but beats it like the old-fashioned dash. It is made in several sizes, and fits all the old-fashioned round tub or crock churns. Can also be used in an ordinary creamery pail. It is the best and cheapest in the market. County rights for sale.
M. J. NEWHOUSE,
Sole Manufacturer and Agent for New York State. ONEIDA, N. Y.

Miscellaneous.

THE NEW SHEEP DIP.
Little's Chemical Fluid.

Non-Poisonous. Non-Corrosive.

Specific cure for Scab, Mange and any skin disease. Ticks and Lice on all animals, Fleas on Dogs, Worms in the Throat, and internally, as well as sore eyes in Sheep and lambs.

It is before all other dips in the simplicity of its preparation. It mixes at once with **cold** water, and a single trial will prove that on coming into contact with the water the whole is changed into a milk-white Dip, which is **distinctly not the case with any other material.** Dispenses entirely with fires and boilers, which are necessary with Tobacco and other Dips. The sheep may be dipped with perfect safety in the coldest weather.

Send 3-cent stamp for Testimonials and prices to **T. W. LAWFORD,** Gen'l and Wholesale Ag't, **No. 296 E. Chase St., Baltimore, Md.**

Wanted.

A thoroughly practical man, with large experience in putting up canned goods, such as Tomatoes, Corn, etc. To one who can give good recommendations and testimonials, a good salary will be paid, or, by putting in some capital, an interest may be obtained in the business. Parties applying will please to address **BOX 47,** Brantford Post Office, Ontario.

200 KENTUCKY MULES.

All grades and sizes, constantly on hand, for sale low. E. B. BISHOP'S SONS, 630 Grand St., Jersey City, N. J.

EGGS FOR HATCHING

All subscriptions received after this date, will be placed on our lists to receive the Rural New-Yorker one year, counting from the date when the subscription is received. We have no back numbers.

HOME NEWS.

MONDAY, March 21, 1881.

THE rumor that Gen. Grant would resign the Presidency of the Word's Fair commission at its last meeting, called a large attendance. He did not resign then, but probably will before leaving for Mexico, to-day. A resolution was adopted that the Inwood site be retained as the place for the exhibition. It was also resolved that the members of the commission and Executive and Finance Committees agree to raise $1,000,000 by the 15th of April on condition that the transportation companies give $1,000.000, and the citizens of New York, not represented by these companies and not now subscribers, give $1,000,000. During the afternoon $27,000 were received, and the total amount now subscribed is $1,000,000.

Gen. Upton, U. S army, committed suicide on the 15th inst. by shooting himself through the head with a pistol. He was a graduate of West Point, and distinguished himself during the war for his devotion to duty. He was also the author of a standard military work entitled "Infantry Tactics."

All the ice in the Hudson is broken up from Hudson south to New York, and boatmen are hurrying in every direction to get their craft ready. A boat can go through to Albany without much difficulty.

The toral debt of our country has been reduced to $2,113,164,589.46, and money in the Treasury amounts to $233,258,176.69. Decrease of the debt last month $11,843,155.51: since June 30th, $62,215,-882.57.

Mackey, the California bonanza king, is arranging to bring his family from Paris, and will live permanently in New York. He has purchased the Stevens mansion on Fifth Avenue, the price being about $750,000.

On the 15th inst. the Maine Senate balloted for United States Senator, with the following result: William P. Frye, of Lewiston, had 23, Richard A. Frye, of Bethel, had 5. At the same hour in the House the result of the vote was as follows: William P. Frye, of Lewiston, 82, Richard A. Frye, of Bethel, 59.

The public debt of the United States is $68 per head; of Spain, $154; of France, $136; of England, $117; of Holland, $114; of Canada, $28; of Mexico, $39; of Switzerland, $2. Let's move to Switzerland.

The recent census shows that the native population of the United States is to the foreign as six and a-half to one, and that the foreign-born and colored people are about equal in number, the latter numbering 6,577,151.

In Chicago, at a meeting of citizens to take steps commemorative of the tenth anniversary of the great fire, it was proposed to erect a building for the public library to cost $500,000. This library has grown from a nucleus of 7,000 volumes, which Tom Hughes secured as a gift from English authors and publishers to the city immediately after the fire.

Moody and Sankey have entered upon the seventeenth and last week of their work in San Francisco. Large crowds have attended all the meetings and the accession of new members to the churches has been notable.

At the annual Commencement exercises of the Women's Medical College of Philadelphia, degrees were conferred on 19 women, six of whom were from Pennsylvania, three from New York and the remainder from various States.

One of the most remarkable freaks of lightning on record occurred near Florence, S. C., on the 16th inst. The victim of this phenomenon, Joe Biggs, a farmer, about 60 years old, was returning from his work in a field a short distance from his house, when he was overtaken by the storm. A terrific stroke of lightning came, which killed him instantly, and, tearing the earth up all around him, dug his grave and completely buried the old man in it. Biggs was only discovered by some portion of his old overcoat sticking out of the earth and revealing the place of his interment.

The fund, originally proposed for the oldest living ex-President, by the New York Times, has been converted into a fund for Gen. Grant alone, in view of the great services he has rendered the nation. The $250,000 for the fund, have been subscribed, and $216,000 have been paid in to the treasurer, Geo. Jones, publisher of the Times.

The newest monopoly is a syndicate for the manufacture of matches, with a capital of $2,500,-000, and head-quarters at New Haven, Conn. Ten large factories have been consolidated, with the intention of controlling the American market. They pay the government $3,500,000 per annum for stamps.

A strike at the American Printing Company's works of Fall River Mass., is in progress. There is not enough machinery in operation to pay for running, consequently the managers have decided to shut down until the strikers are ready to return to work. It is stated on good authority that the profits up to the present time will not guarantee an advance of wages, and that, if it were possible, concessions would be made to the operatives.

A tornado passed over a large part of Southwest Missouri, on the 15th instant, accompanied by rain and hail. At Galena, just across the Missouri line, it demolished about 15 buildings, mortally wounded two persons, and severely injured six others. The large tabernacle was completely destroyed. Several buildings were blown down at Joplin, but at Carthage the damage was slight.

Mr. J. Stanley Brown has been appointed private secretary to President Garfield. Mr. Brown was formerly stenographer to Major Powell of the Smithsonian Institution, and went to Gen. Garfield in the same capacity while the latter was still in the House of Representatives. Mr. Brown was at Mentor during the campaign and has been acting as President Garfield's secretary since the inauguration. He is a young man about 24 years of age.

Harry Genet one of the convicted Tweed Ring, has been sentenced, in New York, to the penitentiary for eight months, and to pay a fine of $9,604, to stand committed until the fine is paid.

[Jackson Daily Patriot.]

HAPPY FRIENDS.

Rev. F. M. Winburne, Pastor M. E. Church, Mexia, Texas, writes as follows: Several months since I received a supply of St. Jacobs Oil. Retaining two bottles, I distributed the rest among friends. It is a most excellent remedy for pains and aches of various kinds, especially neuralgia and rheumatic affections.

FOREIGN NEWS.

The assassination of the Czar is still the chief topic in Europe. Three men and a woman implicated in the crime, including Roussakoff who threw one of the bombs, have been subjected to judicial investigation, Roussakoff, it is said, under torture. Numerous other arrests have been made. It seems as if it would have been impossible for the Czar to escape that day. Several others were equipped and ready to throw other bombs had he escaped that which proved fatal. Another road by which he might have returned to the palace had been undermined and the mine was charged with dynamite. Some say this was intended to destroy the present Emperor near whose palace it was constructed; others say it was to provide death for the late Emperor if he had gone that way. The new Czar seems disposed to carry out and add to the liberal policy his predecessor is reported to have been on the point of inaugurating. A sort of parliament, it is said, will soon be established; the hardships of exile in Siberia will be mitigated, and many exiles restored to their homes. All foreign Courts, and especially Germany, have been assured of the friendship of the present Czar, who declares that his policy will be to institute internal improvements, to aid in maintaining peace among neighboring nations and to go to war only to defend the soil or honor of the nation. On receipt of the news of the death of her husband the Princess Dolgorouki, whom the late Czar married, against the wishes of his family, soon after the death of his wife, a short time back, and by whom he had previously had quite a large family, of course fainted, and then on recovery at once started into what is supposed to be a life-long exile. She has a handsome fortune "precautionally" lodged in the Bank of England by her husband shortly after their marriage—anywhere between $5,000,000 and $20,000,000.....This morning's cablegram announces that it is stated at St. Petersburg that the payments due from peasants for lands allotted them on the abolition of serfdom are about to be reduced in 23 governments by 40 to 70 per cent. the total reduction aggregating 9,000,000 rubles yearly, a ruble being worth about 80 cents.

The feeling is very strong in Europe that arms alone can decide the dispute between Greece and Turkey. The Powers have been trying to mediate, but as each has interests different from those of the others, they have not been acting honestly and therefore the Turk has been prevaricating and the Greek blustering. War is expected to begin soon; when and where it will end even Bismarck would be puzzled to say. Last Thursday France issued a new loan of 1,300,000,000 francs, a franc being equal to about 19 cents. Up to two o'clock on Friday morning thirty times the amount was subscribed. The interest was only to be three per cent, and such a rush of money to take up the loan speaks well for the credit of France and the thrift of her people, as most of the offerings came from them in small sums.

The British Government, having, after a world of trouble, succeeded in passing the "Coercion Bill," establishing martial law in any part of Ireland it may choose to "proclaim," is now suppressing discontent by imprisoning a handful—about 50—of village blatherskite politicians, while letting the prominent leaders severely alone. There seems to be no danger of an outbreak, as the country is full of troops ready for instant action. Down in South Africa the few scattered Dutch Boers in the Transvaal have inflicted greater loss and—yes—disgrace on the British arms than the Irish have done since the siege of Limerick in 1651. They have three times utterly routed detachments of British troops who advanced rashly against them, confident of whipping them easily because they had found no difficulty in chastising savage Zulus, Kaffirs, Dahomeans and Abyssinians. The Government has concluded a truce with the victorious "rebels," and negotiations for peace are now in progress, the insurgents demanding independence under a British protectorate, and the English asking an honorable submission.

[Clinton, (Iowa) Herald.]

James Butler, Esq., Clerk of the Roxbury Carpet Co., Boston, Mass., employing eight hundred hands, in a late communication concerning the admirable working of an article introduced into the factory, says: The famous Old German Remedy, St. Jacobs Oil, has effected several cures among our men, who have been badly hurt in working in the factory, and they pronounce it a success every time.

AGRICULTURAL NEWS.

THE Board of Control of the New York Experiment Station met at Albany on the 11th inst. The Committee on Location presented their report with about 50 offers of land, etc., for the station made by farmers living in various parts of the State all the way from Niagara Falls to Montauk Point. A letter from Henry W. Sage, President of the trustees of Cornell University was read, offering for the use of the Station land, barn, stock, tools and the services of the Professors in all branches where their assistance might be desirable, with scientific apparatus, all free of charge. A Committee was appointed to visit such sites as might be deemed advisable, before making a final report. This Committee consists of Robt. J. Sevan, Geneva; P. Barry, Rochester; Robt. J. Dodge, New York; Jas. McCann, Elmira, and Dane Batchelor, Utica.

Careful investigation puts the number of cattle grazing in the region drained by the Arkansas and Missouri Rivers at 3,750,000 head, of which from 15 to 20 per cent. by latest accounts are estimated to have perished during this Winter. Herds crossed with Eastern and imported stock are reported to have suffered most heavily.....The owner of the ground on which the Andersonville stockade stood is about to plow it up for a cotton field..... A parasite has appeared in the orange groves of Italy, the West Indies, Florida and California, which ruins vast numbers of trees and threatens to seriously interfere with orange culture. The Italian Government offers 300,000 francs and one of the wealthy citizens 100,000 more for an effectual remedy for the pest.. ....Vennor's latest.—"The Spring will be fairly early, hot and dry, and the Mid-summer cool and wet. The Autumn promises to be open, dry and fine. There is likely to be a great deal of sickness during the year, but the weather—except in a few isolated sections—will be favorable to agricultural pursuits. The Winter of 1882 bids fair to be open and generally mild, with but few, and those short-lived, storm periods".... ....Russia's wheat deficit last year is officially put at 65,000,000 bushels.....A company with a capital of $500,000 has been organized to build mammoth grain elevators at Council Bluffs, Iowa, to meet the demands of the grain trade over the seven railroads centering there.....Severe floods in Hungary are doing much damage to farmers... ....At a special meeting of the Milk Dealers' Association held in this city on Tuesday, 15th inst., it was agreed that the rate per quart to be paid to the producers by the dealers of New York, Brooklyn and Jersey City should not exceed three cents. Considerable trouble is expected as to the price of milk here the coming Summer, as the farmers who supply the market have in many places formed stock companies and determined to sell their milk to "creamery associations" or "butter associations," when prices rule low. ....

The late Lord Seafield planted not less than 60,000,000 trees on his estates in the counties of Elgin, Banff and Inverness, Scotland.....The average gross weight of the 474,159 hogs packed at St. Louis in 1880, was 250 1-10 pounds; average cost per hundred gross, $4.62; average yield of lard per hog, 35⅓ pounds.....In Berlin each district has an inspector of hog products, as a guard against trichinæ, and he is held to strict accountability that no meat infested with this terrible parasite shall be sold. Close to the city is a place in which the infected meat, after being cut into small pieces, is boiled for 12 hours and then subjected to the action of chemicals that reduce it to a powder.....A dispatch from Sioux City, Ia., says the demand for corn for fuel there is increasing, and teams are scouring the surrounding country for a supply. The selling price has advanced to 35c. a bushel for A No. 1, burning corn. No hard or soft coal; considerable green, but no dry wood in hands of dealers..... ....In 1877 a lot of dressed meat was shipped from this city for Liverpool on the Inman steamer, City of Bristol. When 400 miles out she broke her shaft and the Captain decided to complete the voyage under sail. The trip was long, provisions ran short, some of the meat was eaten, the rest become tainted and was thrown overboard. The shippers sued the Company for damages on the ground that the Captain should have made for the nearest port. The first trial resulted in a verdict against the Company; an appeal was in its favor; but a final appeal has just awarded the shippers $32,624 29.....All the New England Senators, except the Vermonters, support Dr. Loring as Le Duc's successor,..... R. L. Lindsay, a St. Louis lawyer, has been arrested for conspiracy to defraud the government out of lands by uttering false deeds under fraudulent titles. Operations were begun before 1860, and it is estimated that from 3,000,000 to 4,000,000 acres in Southeastern Missouri are involved. Lindsay is in prison for lack of $10,000 bail.....Gen. Mahone, of Va., who was elected as a Readjuster and who has just cast in his lot with the Republicans to the intense disgust of the Democrats, has been made Chairman of the Senate Committee on Agriculture,.....

In England the wheat crop is badly in want of dry weather. Some Spring sowing is over on light soils.....A despatch from Urbana, Ohio, says that a couple of farmers there bought "Hulless" Oats from traveling agents, and afterwards found they had signed notes aggregating $1,000 which they have had to pay—but they haven't got a grain of oats yet.....The Congress of Farmers and Agriculturists of Germany at their late meeting at Berlin passed the following resolution:—

"The Congress of the German Agriculturists regards American competition in regard to cereals, breadstuffs, and meats as of great danger to the interests of all those engaged in the raising of grain, cattle, swine, sheep, etc., and the Government of the German Empire is requested to adopt such measures as will avert and remove the detrimental effects of this competition upon the German agricultural interests." The necessity for a strong protective tariff for home-grown farm products was strongly insisted upon.....

Reports from Wisconsin say that the wheat crop there has hitherto not been injured to any extent. .....Late telegraphic reports from Kansas express fears that the peach buds have been injured. .....The Board of trustees of the Illinois Industrial University strongly recommend the Hon. Emory Cobb as head of Agricultural Deparment. .....The average weight of hogs packed last year at Cincinnati, was 268.37 pounds an increase 2.06 pounds over the previous year.....

The exports of wheat and flour from Australia and New Zealand to the United Kingdom in 1880 were equal to 13,040,000 bushels of wheat, including 7,040,000 bushels from South Australia, 3,600,000 bushels from Victoria and 2,400,000 bushels from New Zealand.....The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and seaboard ports and on rail from Western lake and river ports and frozen in on New York canals:

	1881, Mar. 12, bush.	1881, Mar. 5, bush.	1880, Mar. 13, bush.	1879, Mar. 15, bush.

It is now proposed in the French Assembly to raise the duties on imported oxen and bulls from 6 to 30 francs; on cows from 4 to 10 francs; on calves from 50 centimes to 2 francs; on sheep from 1½ to 3 francs, and on goats from 20 to 50 centimes.....

Effectual and Cheap.

Dyspepsia, bilious attacks, headache, and many other ills can only be cured by removing their cause. Kidney-Wort has been proved to be the most effectual remedy, for these and for habitual costiveness which so afflicts millions of American people.—Farm and Fireside.

Women that have been bedridden for years have been entirely cured of female weakness by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 50 cents per box.

Mr. John Cherry 1234 Kater street, Philadelphia, was cured by St. Jacobs Oil of a fearful attack of rheumatism in his hands,—says the Philadelphia Ledger.

All your own fault if you remain sick or out of health, when you can get Hop Bitters.

A FINE HAIR DRESSING.

Cocoaine dresses the hair perfectly, and is also a preparation unequalled for the eradication of dandruff.

THE superiority of **Burnett's Flavoring Extracts** consists in their purity and great strength.

The Markets.

SPECIAL FROM THE CHIEF CENTRES.

Until Saturday, March 19.

Chicago.—BUTTER.—Fine goods are firm, but the tendency in low and medium grades appears to be to an easier condition. Roll butter dull on account of the soft weather. Creamery, 30@34c.; dairy, choice, 25@28c; dairy, fair to good, 21@24c.; ladle-packed, 16@20c.; packing stock, 13@15c.; roll butter, 15@20c.; grease, 8@10c. CHEESE.—Full cream, 13@13½c.; part skim, choice, 10½@11½c.; do. fair to good, 9½@10½c.; do. hard, 7½@8½c.; low grades 4@6c. EGGS—In liberal supply and low at 17@18c. ₰ doz. SEEDS—Dull and inactive for clover, active and higher for timothy, and steady for flaxseed. The receipts of the leading seeds were liberal. Strictly prime clover was salable at $4.85@4.90, with Mammoth at $5.20@5.40. Prime timothy was in active request, and sold at $2.67½@2.70. The few sales of flax-seed were at $1.18 delivered. Hungarian was firm at 65@68c., and millet was in good request and firm, but there was little on the market. Sales were made of 66 bags clover seed at $4.40@4.75 for poor to good, and $5.30 for Mammoth; 3 cars and 1,679 bags timothy at $2 40 for poor, $2.60 @2.70 for good to prime, and $2.72@2.75 for choice; 330 bags of millet seed at 80@85c.; 1 car and 33 bags Hungarian seed at 65@70c. SALT.—Fine, ₰ bbl. $1 05; coarse, $1.25@1.30; dairy, with bags, $2.40@2.85; dairy, without sacks, $1.90; Ashton dairy, ₰ sack, $3.05; ground alum in bags, $1.10; Liverpool fine, brown sacks, $1 50. WOOL.—The market is slow, in sympathy with the trade at the East. Good to choice medium tub, 45@48c.; coarse and dingy tub, 35@44c.; fine and unwashed fleece, 21@30c.; coarse and unwashed fleece, 20@26c.; medium unwashed fleece, 29@33c.; medium washed fleece, 40@43c; fine washed fleece, 39@42c.; coarse washed fleece, 35@37c.

WHEAT steady, with a fair demand; No. 2 Red Winter, $1 07@1 09; CORN in fair demand; No. 2 Mixed, 47c. OATS firm; No. 2 Mixed, 38@38½c. RYE quiet; No. 2 at $1 12@1 13. BARLEY strong; No. 2 Fall, $1 07@1 09. PORK dull at $15 25. Lard dull at $10 60. Bulk-meats dull, weak and lower; Shoulders, $5; Clear Rib, 7¾c. Bacon quiet but steady; Shoulders, $5 75; Clear Rib, $8 70; Clear Sides, $9.

Cincinnati.—Fancy Northwestern creamery sells at 36c., choice dairy at 25c; choice Western Reserve at 22@25c; prime to choice Central Ohio at 18@21c; and common medium do. at 15@17c ₰ lb. CHEESE. —Market steady and firm for prime to choice cured factory at 12@12½c, and prime Northwestern late made at 11@11½c ₰ lb. EGGS—All offered sell readily, and the market closes firm at 13½@ 14c ₰ dozen, with most of the sales to-day at the lower price. CABBAGE.—Market steady at $7@10 ₰ 100, and $2.25@2 50 ₰ bbl. from store. Southern new are dull at $3 ₰ crate. ONIONS—Dull, with liberal offerings of choice yellow Danvers at $4.50 ₰ bbl. and $1 80 ₰ bushel, and some inferior to good can be bought at $3.50@4 per barrel. TURNIPS—Are dull at $1.50@2 per barrel. HAY.—Liberal receipts, but the demand being fair prices are well sustained. Common sells at $14@15.50; prime do. at $16@17 ₰ ton; prairie hay $10@11 per ton in bales on arrival. Wheat and rye straw is steady at $8@8 50 and oat straw firm at $9@9.50. SEED.—Market firm. Prime old clover sells at 8¾; prime to choice new do. at 8¾ @8¼c ₰ lb, and timothy at $2.75@2.80 ₰ bushel from store. Round lots on arrival would not bring these prices. Flaxseed is in demand at $1.12½@ 1.15 ₰ bushel. SORGHUM.—Good to choice sells at 30@35c per gallon in lots. Sales are made at 1@2c more by the single barrel.

WHEAT fairly active. No. 2 Chicago Spring, regular, $1 02¾; fresh, $1 04¾, cash; $1 02¾, April; $1 08, May; $1 08¾, June. CORN in good demand

at 39@40¼c, cash: 39¼c, April; 43¼@43¾c, May and June. OATS firm at 30½@32c, cash; 30½c, April; 34¼@34¾c, May. PORK dull, weak, and lower, at $15 40, cash; $15 40@15 42½, April; $15 55 May: $15 70, June. Lard active but lower at $10 55, cash and April; $10 70, May; $10 82½, June. Bulk-meats easier; Shoulders, $5 05; Short Rib, $7 95: Short Clear, $8 30.

St. Louis.—WHEAT weak; No. 2 Red Fall, at $1 03¼@1 04, cash; $1 04¼@1 05¼, April; $1 06¼@$1 07¼, May; $1 05¼@1 05¾, June; 96¼@96¾c., all the year: No. 3 do., $1 01¼ bid; No. 4 do., 93c. bid. CORN 41¼@41½c., cash; 41¾@42c., April; 42@42½., May; 42½@42¼c., June; 42½c., July. OATS 35¼c., cash; 35@35¼c., May; 34½@35¼c., June. RYE at $1 05 bid. PORK quiet at $15 75, cash; $15 70, May. Lard dull and nominal at 10¼c. Bulk-meats easier, but not quotably lower. Bacon lower; Shoulders, $5 75; Clear Rib, $8 70; Clear Sides, $8 85@8 90. BUTTER—Creamery at 30c for ordinary to 32@34c, for choice; dairy packed, extra selections, 27@28c; prime 20@23c, common to fair 12@16c; ladle packed, 18@22; roll mainly 14@16c for country to 20@22c for Northern. POTATOES—Peerless at 87½c, Rose at 93c, Burbank at 94@95c. Choice Western quotable at 80@90c. ONIONS—Prime ₩ bbl. at $4 60@4 75 to $5—latter for large bbls—and ₩ bush at $1 90@2. Red preferred to yellow. A car bulk yellow resold at 89c del. FLAXSEED steady at $1 12½ on basis of pure. GRASS SEEDS—Timothy at $2 45@2 55 and Redtop at 45@47½c. Clover $5@5 10; German millet 75@85c for inferior and dirty to 95c for prime; common millet at 65@72½c: Hungarian at 55@62½c. HOGS dull; light grades lower; Yorkers, $5 60@5 70; Baltimores and light butchers', $5 75@6 10; choice to fancy heavy, $6 10@6 30; mixed packing, $5 35@$5 75. CATTLE active and firm; exporters, $5 15@$5 65; good to choice heavy, $4 60@5 10; light shipping, $4@4 50; best butchers' steers, $4 25@4 50; fair to good, $3 50@4; cows and heifers, $3 25@$4 25; feeders, $4@4 60; stockers, $3@3 75. SHEEP dull and lower; shipments, none; medium to good, $4@5: choice to fancy, $5 15@5 85.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 19, 1881.

BEANS AND PEAS.—The demand for beans is not sharp and with continued liberal receipts the selling feeling is easier without showing a positive decline in best standard marks of white. Red kidneys remain in their former dull rut. They will be likely to drag at the comparatively cheap rates until stocks are reduced.

Green peas slow but steady at $1.70@1.80 for Wis. bbls., the latter from store; B. E. peas $2.10@2.15 ₩ 2-bush. bag. Marrow, medium, pea and white kidney beans, $ t.40@2.10, for fair to prime; red kidney, choice $1.55@1.65, other, $1.40@1.50, black, $1.40.

BEESWAX.—Demand is moderate, with prices unchanged; quoted at 24½@25c.

BUTTER.—There is a fair demand for fine table grades, a class of goods that has been used up pretty close. Supplies have fallen off, but with the decline cannot decrease to an extent that will prevent an unsold surplus by the time new shows a stock. For very common and some medium lots, this is already a settled fact. Very few State dairies remain that will sell upon their original merit. This is one of the disadvantages of holding for the last prices of the season. There must be some peculiar bearings upon the market to make the venture a safe one.

New creamery butter, 30@35c State half firkins, 27@30c; do, Welsh, 24@29c; old creamery, 17@23c; State dairies, best, 24c; other, 14@21c; firkins, 15@23c; pails and half tubs, prime Fall 25@28c, other, 14@23c; Welsh Fall, 22@23c; other, 14@20c; Western imitation creamery, 22@30c; dairy, 14@20c; factory, 13@20c; very poor, 10@12c., grease, 8@8½c.

Receipts for week 20,803 pkgs.

Exports do. 2,265 do.

CHEESE.—There has not been much activity this week, the shipments only 14,787 boxes. Prices however have been held steady and show no decided change, with the stock diminishing scantily. The choicest lots are indifferently offered, the holders depending upon the home trade to take a good portion of them. Quotations are for

State factory, fancy, at 13¼@13½c.; do. good and prime, 12¼@13c.; do. fair, at 11¼@11¾c.; do. half skimmed, 9@10c.; Wisconsin factory, fine, at 12¾@13c.; do. good to prime, 12@12¼c.; do. fair to good, 11@12c.; Ohio factory, fine, 12¾@13c.; do. good to prime, 11¾@12½c.; do. flat, fair to good, 10½@11½c.; do. poor to fair, 8@10c.

Receipts for week, 12,204 boxes.

Exports for week, 14,587 boxes.

Liverpool cable, 70s.

Steam to Gt. Britain, 25s.@27s.6d.

COTTON—Has been subjected to violent fluctuations, the tendency generally lower with a pressure to sell and a fair trading. The latest prices are for March, 10.65@10.67c.; April, 10.65@10.67c.; May, 10.76@10.77c.; June, 10.85@10.86c.; July, 10.94@1.96c.; August, 10.95@11.00c.; September, 10.53@10.55c.; October, 10.40@10.42c.; November, 10.24@10.27c.; December, 10.24@10.27c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*N. Orleans and Gulf.*	*Texas.*

Strict good ordinary	7 11-16	Middling	9⅜

Receipts for the week, 33,623 bales. Exports do. 12,637 do.

DRIED FRUITS.—Apples have a fair home demand and moderate export movement, with prices generally firm. Peaches are steady in price and moderately active. Small fruits are quiet. Quotations:

Evaporated apples at 8@8¾c. sliced apples at 4¾@5¾c. for good to choice North Carolina; 4@4¼c. for Va. apples, 4@4¼c. for Tenn. do; 4¼@5c. for State do; 4¼@4¾c. for western, Ohio and Mich. Peaches at 23@24c. for evaporated peeled; 13@c. for unpeeled do.; N. C. peeled at 19@22c.; for the better qualities, unpeeled peaches at 6@6¼c. for halves and 6@6¼c. for quarters. Plums at 15@16c. Blackberries at 8c. Cherries at 17@17½c. Raspberries at 24c. bid. Whortleberries 10@11c.

Receipts for the week, all kinds, 320 pkgs.

Exports dried apples, 1,031 pkgs.

EGGS—Receipts for week, 11,226 bbls.; do. last week 12,192 do. Consumption is steady and free arrivals keep prices in buyers' favor. Southern have the weakest position owing to small size and poor packing. Small size is not so much of an objection as nest-mussed condition: this prevents them from being mixed in with other lots for retailing. The market closes fairly strong, as there is some outside addition to local wants.

Near points, 21c.; State and Pa., 20@20½c.; Western, 20@20½c.; Southern, 20c.

FLOUR.—There is a more active trade in progress, chiefly on home trade account, with prices stronger.

Latest prices are: $3.35@4.15 for very inferior to very choice superfine State and Western; $4.25@4.50 for poor to choice extra State and Western, odd lots and lines; $4.50@4.65 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4 35@5.25; good to choice do. at $5.35@6.10; (very choice up to $6.25@6.50 and fancy at $6.50@6.75;) red and amber winter wheat, inferior to choice trade and family at $4.30@6; round hoop Ohio, $4.40@4 75; and trade and family brands of do. at $4.85@6.25, the latter for very choice; St. Louis $4.30@5.50 for inferior to good extra; $5.50@6.35 for good, to choice, and up to $6.75@7 for very fancy brands; Minn. clear, inferior to very fancy at $4.35@6.; Minnesota "straight," poor to very choice, at $5.25@6.75, and patent inferior to fancy at $5.75@8.25; city mill extra at $5.60@5.70 for fair to choice for the West Indies; do. for England at $4.30@4.65 for poor to choice spring wheat; do. trade and family extras, $5.65@6.75; do. for South America, $5.65@6.00, the latter for very choice; No. 1 at $3.00@3.65 for very inferior to very fancy.

Receipts for week, flour, bbls. 125,250, corn meal, do. 1,405; wheat, bush. 563,500; corn, do. 565 100; oats do. 218,800; rye, do. 19,950; malt, do. 31,530; barley, do. 32,400 beans, do., 11,500; rice, pkgs. 1,950.

Exports for week, flour, bbls. 107,550 corn meal, do. 3,000; wheat, bush 949,350; corn, do. 858,400; oats, do. 4,682; beans, do. 327; rice do. 266.

CORN MEAL.—Sales at $2.90@3 for Brandywine, and $2.50@3 for yellow Western.

FRESH FRUITS.—The market for apples has assumed the fitful condition that follows a large and badly keeping crop at this advanced date. Reports indicate an abundance yet unforwarded, and the foreign market is having heavy installments. There is little promise of profit for stock now sent abroad from the States. Careless packing has damaged trade abroad, coaped-off lots and the lack of uniform packages have operated badly for owners in very many instances. At the moment Canadian stock is ruling the English trade.

Baldwins and russets pr. $1 50@1 75 greenings $1@1.50; mixed lots $1@1.50; inferior 50c@$1; a few State Spitz exceed $2, but there is an offering at $1.50@2. Cranberries have only a chance sale. Grapes only quotable: N. J. $1@1.75. An offer for a line of barrels would have to be billed from crates. Fla. oranges quiet: West Indian begin to commete with them; half bbl. crates range at $1.50@4 for common to prime Fla., strawberries 50c@$1 ₩ quart; fruit good; Chas. will stop within two weeks; hot-house berries $1.50@2. Peanuts quiet at 4¾@4¾c. for Va hand-picked; good to prime 3@3½; shelled, 2½@3¼. Hickory nuts 75@85; bull nuts 40@50c; Pecans lower 7@8½c.

FURS AND SKINS.—The Producers Price Current of March 19, says:

"Cable advices from the Hudson Bay Co's London sale report an advance in large bear, lynx and wolf of 20 per cent. and in otter of 7½ per cent. as compared with the prices obtained last March. Small bear, cubs, martin, skunk and silver fox sold the same as last March. There was a decline of 5 per cent. in fisher, 10 per cent. in mink and white and cross fox and 12½ per cent in red fox. Mr. Lampson's sale is now in progress. There is but little business doing here at present, as usual during the progress of the foreign sales. Our quotations will be revised next week, when full reports from Mr. Lampson's sale shall have been received."

No. 1 quality	Nor. & East.	W. & S. W.

Ducks, choice, 20c.; other 15@18c; Geese, 8@11c; Squabs, white, $3@3.50 ₩ doz.; do. dark, $1.75@2.

The demand is not active for live as the Jewish holiday is passed and prices are weak.

Fowls, 12@13c.; turkeys, 12@14c.; roosters, 6@7c.; ducks, 70c@1.12; geese, $1.12@2.12, pigeons, 35@45c.

The first English snipe brought $3.50@4 per doz.; wild pigeons scarce and wanted; quoted $1.75@2; wild ducks have a fair trade when prime; Western not wanted being too low in quality with Norfolk, which we quote:

Canvas-backs, 75@$1; red-heads, 75c, mallard 30@40c., teal and widgeon 20@25c.; common, small 15@20c.

PROVISIONS.—Hog products have been in good demand and closed firm.

Mess pork quoted at $15.50 for old and $16.25 for new. Bacon at 8.50 for long clear and 8.85@8.90 for short clear. Lard—Western steam at 11,10@11.12½ for spot lots; 11.07½@11.10 for March; 11.07½ for April, 11.12½ May and 11.17½ for June. Stearine at 11¾. Tallow at 6¼@6¾ for prime. Beef hams at $23¼@23. Beef—Extra India mess quoted at $21@23 for city; $11@11.50 for extra mess; nominal for plain mess; packet at $12@13.

Receipts for week, beef, bbls. and tcs. 934; pork, 3,106 bbls.; cut-meats, 28,089 pkgs; lard; 11,900 pkgs.

Exports for week, beef, bbls. and tcs., 2,215; pork; 3,025 bbls.; cut-meats, 10,403 459 lbs.; lard, 8,131,575.

SEED.—Clover is moderately active at 8¼@9. Timothy is quiet and wholly nominal.

TOBACCO.—Export demand is moderate only and the increase for seed-leaf fair, with prices generally steady.

VEGETABLES.—The market is fairly strong for choice, but as free deliveries are expected when the river opens, holders here are making a pretty general offering. It is likely, however, that many of the canal-boat stored now at Albany will prove poor in quality.

Bermuda second-crop potatoes, $5@6; Early Rose Eastern d.-h. $2.50, do. State, $2@2.25; do. in bulk, $2@2.12; Prolific, Eastern, $2; Mercer, 1.75@1.87; Burbank, $2@2.25; do. d.-h., $2.12@2.25; Snowflake, $2.25@2.37; Snowflake, bulk, $2@2.25; Peerless, $1.75@1.87; sweet, $2.25@2.50. Green stuff is in good variety but starts slowly. The list is as follows: Fla. green peas $4@5 ₩ crate; do. tomatoes, $2.50@3 ₩ half bush. box; W. Indian tomatoes 40c@$1; Bermuda beets $1.75 ₩ box; Spinach Norfolk $2@3 ₩ bbl.; kale, do. $1.50@1 75; Chas. asparagus $12 ₩ doz.; R and W. turnips, 50@75c. ₩ bbl.; Hubbard squash, $1.12@1.37; marrow do. 50@60c.; cabbages, $4@7 ₩ 100; onions, white, $5@6.50; other, $3@3.75; carrots $1@1.25 ₩ bbl.; celery, 75c.@$1.25 ₩ doz.

WOOL.—The market is depressed and lower. Manufacturers are not inclined to buy materially. Ohio and Penn. fleeces quoted at 40@43½. X and XX Mich. and Wis. fleeces at 40 for X, medium and No. 1. Ohio and Mich fleeces at 45@47.

LIVE STOCK MARKETS

NEW YORK, Saturday, March 19, 1881.

BEEVES.—Receipts for the week 10,388 head; do. last week, 11,618 do. The week has been uninteresting. Supplies have been small, but with pretty even grades the range of prices was short—9@10¾ to dress 56@57 lbs. and to prime steers: a single pair at 11½c. Export trade light.

VEAL CALVES.—All stock is plenty and prices are easy.

Live calves, choice, 8c.; fair to prime, 6@7½; poor, 5@5½c.; Mt. Holly, 5@5½c.; buttermilk, 3@4c. grassers, 2¾@2¾c.; dressed, choice, 10c.; other, 6@8c.; very poor, 4@5½c. "Bob" veal is confiscated as fast as it arrives.

COWS AND CALVES.—Receipts are large and few sales make the extreme; prices range $25@55 per head.

SHEEP AND LAMBS.—Receipts for week, 24 179 head; do. last week, 28,121 do. Market dull; stock generally held above butchers' views. Sheep 5¾@6½c.; yearlings, 6¾@7c. Spring lambs easier at $4@7 ₩ head.

SWINE.—Receipts for the week, 14,921 head; do. last week, 20,475 do. Market weak. Live corn-fed hogs, $5.85@6.30, country dressed pork, light, 8¾@8¾c.; medium, 8c.; heavy, 7¾@7½c.; city dressed, 8c. Pork tenderloins, 10@11c.

Practically Portable Steam Engines,

And with determined policy to build only the BEST MACHINERY from the BEST MATERIALS, and in the BEST MANNER OF CONSTRUCTION, and with continued improvements, have attained the HIGHEST STANDARD in excellence of workmanship, simplicity of design and capacity of power. For a quarter of a century have maintained their manufacture, the

Standard Portable and Agricultural Engines of the world. Descriptive Circulars sent on application. Mention this paper.

Trade **LONDON PURPLE.** Mark.

Valuable insecticide for the extermination of the COLORADO BEETLE, COTTON WORM and CANKER WORM. For prices, Circulars and Opinions, write

HEMMINGWAY'S LONDON PURPLE CO., (Limited) 90 Water St., New York.

Professor C. V. Riley says: London Purple can be more effectually sprinkled or sprayed on to the plant than Paris-green by virtue of its greater fineness.

Professor C. E. Bessey says: It promises to be a most excellent remedy. It quickly kills both the Larva and the Winged Insects.

Professor J. L. Budd says: A single application placed every one of the pests on their backs over the ground, either dead or in a dying condition, in less than six hours.

Reading for the Young.

FARMING FOR BOYS AND GIRLS—NO. 16.

HENRY STEWART.

Artificial Fertilizers.

THE whole universe comes to the help of the farmer. For him the sun shines, the showers fall; the dews distil; the lightning flashes; plants grow; animals live and all nature works in its silent and mysterious, but beautiful manner. Even the myriads of fish which swarm in the Southern oceans, and the countless flocks of sea birds which inhabit the lonely, rocky islets and barren coasts of those oceans, have been existing and working for ages, for the farmer's benefit.

In the depths of those oceans there have been growing minute plants upon which some of those fish feed. These fish have furnished food for millions of sea birds. These birds have made their roosting places and their nests upon the barren rocks which were avoided by the sailors on account of the treacherous reefs and shoals which surrounded them. Here in solitary safety, the birds have bred and fed and died, for centuries, until their droppings and their dead bodies have accumulated in deep beds covering the rocks. As not in falls in this part of the ocean, these droppings were preserved in the most perfect manner and retained every soluble part that might otherwise have been washed away. These beds of sea-bird dung furnish the most valuable of artificial manures which is known as Peruvian Guano. Guano is named from a Peruvian word, "huano," which means dung or manure, and was in use by the Peruvians when the continent was first discovered by the Spaniards. It is remarkably rich in ammonia and phosphoric acid, good samples containing 10 to 15 per cent of the former and 13 per cent. of the latter, with more than two per cent. of potash. It is most valuable because it is nearly wholly soluble and therefore acts very rapidly; 100 pounds of good guano contain as much ammonia as 3,000 pounds of good manure and as much phosphoric acid as 6,000 pounds; and being thus so very rich, it should be used with caution. From its character it is found useful for all crops, but is especially valuable for grass, root crops, garden vegetables and others which require abundance of ammonia.

Superphosphate of lime is the next valuable fertilizer. This is really artificial in every sense because it is made and never found naturally. It is made from phosphate of lime, a compound of lime and phosporic acid, which exists in bones and in a rock known as apatite or natural "rock phosphate." But phosphate of lime does not contain as much phosphoric acid as the farmer wants for his crops, and he therefore employs the chemist to change the character of it, and give it an extra quantity of the acid and thus make of the simple phosphate a *super* or *extra* phosphate. Lime and phosphoric acid unite naturally in the proportion of three parts of the former to one of the latter. The chemist calls this *tri-calcic* (three-lime) phosphate. In this state it is not soluble, except in bones which are only slowly soluble.

But the farmer wants his fertilizer to act at once. The chemist then mixes sulphuric acid with the natural rock phosphate or with the bones, and this acid takes away from the phosphoric acid two parts of lime and leaves only one part of it. This is the *super* phosphate, of the former, because the phosphoric acid is in excess; and it is the *mono-calcic* (one-lime) phosphate of the chemist. In this state it is completely soluble, and if applied to a crop of wheat, or turnips, or to a grass field, its effects are seen at once. Bones finely ground are sometimes used in place of the superphosphate of lime and are very valuable, but they act slowly, and the farmer sometimes is not inclined to wait for their effect upon the crops.

Gypsum is known as plaster. It is a soft, whitish rock, which contains 32½ parts of lime; 46½ parts of sulphuric acid, and 21 parts of water in 100. For use as a fertilizer it is ground in mills very finely, and is spread upon the crops. It has a remarkable effect upon clover and is mostly used for that crop or for corn. It is found very useful when scattered upon manure heaps or stable floors, as it readily combines with ammonia, and forms a sulphate. The ammonia in the state of carbonate, is combined with carbonic acid. As we have previously seen, lime is very eager for carbonic acid, and as ammonia is just as eager for sulphuric acid, the carbonic acid leaves the ammonia and unites with the lime, forming carbonate of lime; while the sulphuric acid and the ammonia unite, and form sulphate of ammonia; a change of partners, as it were, all round. When a quantity of gypsum is scattered over a strong smelling stable, these new combinations are formed, and the ammonia is fixed and is no longer apparent to the scent. It is thus saved from waste and loss.

Potash salts are brought from the salt mines of Germany. They consist of potash in combination with sulphuric acid, or muriatic, (otherwise called hydro-chloric) acid, and mixed with common salt and magnesia. They have been found very useful and have largely taken the place of the wood ashes which were once abundant, but of late years have become very scarce. Potash salts are chiefly used in mixtures with other fertilizers; or by themselves upon grass lands.

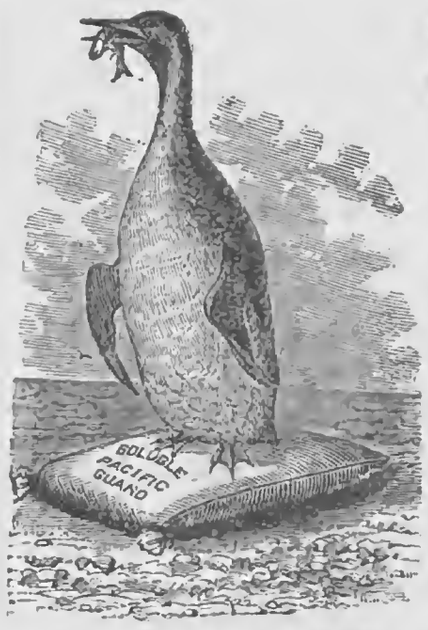
Fertilizers.



SECOND TO NONE.

Soluble Pacific Guano.

Sale in 1865 - - - - - 754 Tons.
" 1880 - - - 44,700 "

This Fertilizer, which was at first sold almost entirely in the Southern States, has of late years become so deservedly popular in the North, for the cultivation of all Farm Crops, that the Company have enlarged their works especially to supply the Nothern demand, and we are now in a position to fill orders promptly. Pamphlets containing testimonials and other information furnished by our local agents, or on application to

GLIDDEN & CURTIS,
GENERAL SELLING AGENTS OF PACIFIC GUANO COMPANY
Boston, Mass.

BOWKER'S HILL AND DRILL PHOSPHATE
SEND FOR PAMPHLET.
This is a true bone superphosphate, and may be used *on any crop*, in the hill or drill or broadcast, either *with* or *without* manure, and will produce a much earlier and larger crop. In the Report of the Mass. Inspector of Fertilizers, its valuation is from $2 to $10 per ton higher than other Phosphates which sell at the same price. The past year over 3000 tons were sold against 100 tons three years ago, showing that it is liked by the farmers. If there is no local agent near you, send to us.
Also for sale STOCKBRIDGE MANURES.
BOWKER FERTILIZER CO.
BOSTON & NEW YORK

STOCKBRIDGE MANURES
SEND FOR PAMPHLET.
These manures are the richest fertilizers now manufactured, and the best substitute for, and costing *much less* than guano, which is now practically out of the market. Unlike guano, they *are not stimulants* and *exhaustive*, but *permanent* and *lasting*, being composed of bone, potash, etc. You can draw at one load enough for 3 to 5 acres, or as much plant-food as is contained in 20 loads of ordinary straw manure. Corn, potatoes, hay, etc., are bringing such good prices that it will pay to use the Stockbridge extensively. If there is no local agent near you, send to us.
BOWKER FERTILIZER CO.
BOSTON & NEW YORK.

PERSONAL ITEMS.

Bismarck says he will hold office until the day of his death.

Senator Sawyer, of Wisconsin, is said to be worth $7,000,000.

Dr. Cumming, the once well-known London preacher, is now out of his mind.

Mr. Herbert Gladstone, the Premier's son, will be married this Spring to Miss Tollemache, a lady prominent in London society.

W. K. Rogers, who acted as private secretary to ex-President Hayes during the latter's entire term, will shortly open a law office in this city.

Somebody who did not fancy Robert Lincoln's appointment to the cabinet, remarked that it was on the potato principle—the best part underground!

Postmaster-General James started in life as a printer's boy, having served his apprenticeship under Wesley Bailey, the veteran abolition editor of the Utica N. Y. Liberty Press.

Judge James W. McDill, of Iowa, who succeeds Mr. Kirkwood in the United States Senate, is also an Ohio man. He was born at the village of Momal, in that State of statesmen, 47 years ago.

Senator Allison is said to have refused a Cabinet position "because his wife's health would not have permitted her to endure the great social burden that must have fallen to her lot as the wife of the Secretary of the Treasury."

Louis, Bavaria's crazy King, now keeps his palace closed all day and opened between sunset and sunrise. At sunrise the court goes to bed. When the stars begin to twinkle everybody marches down to breakfast and the King calls for shaving water.

"No, I am not worth a million of dollars," said Senator Brown, of Georgia, to a reporter, "nor is any other man in Georgia, if his debts were all paid. Young man," continued the Senator, looking at him benignly over his spectacles, "a million dollars is a good deal of money."

Wendell Phillips said in a public address a few days before the assassination of the Czar: "I look at Russia, 4,000 miles away, and see what incubus is resting on her people. I only hope that somebody will lift it off their shoulders. If nothing will do it but the dagger, then, welcome the dagger."

Remain at Home.

If you are suffering from Consumption or Catarrh, don't let your friends or your physician induce you to leave home and its comforts for Colorado or Florida. Send for the Compound Oxygen Treatment. It will do more for you than any change of climate. In a recent letter from Hon. Wm. D. Kelly, introducing a friend, a resident of our city, whom he had persuaded to give Compound Oxygen a trial, he says: "His physicians advised him to go to a better climate; but his means will not permit this, and I know that the climate of Philadelphia improved by your Compound Oxygen, *will do him more good than a removal to any climate on this continent;* and in saying this *I speak my own large experience* in California, Florida, and in the elevated plains of the country." As Judge Kelly is one of our oldest patients, his opinion of Compound Oxygen is of great value. Our Treatise on Compound Oxygen, containing large reports of cases, with full information, *sent free.* Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

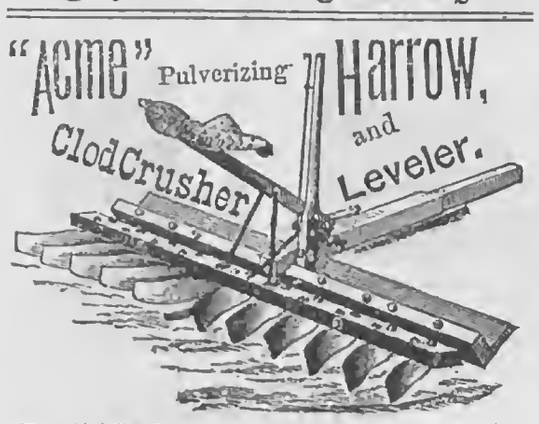
Implements and Machinery.

"Acme" Pulverizing Harrow, Clod Crusher and Leveler.



The *"ACME"* subjects the soil to the action of a *Crusher* and *Leveler*, and at the same time to the *Cutting, Lifting, Turning* process of double rows of
Steel Coulters
the peculiar shape and arrangement of which gives *immense cutting power*. The *entire absence of Spikes or Spring Teeth* avoids pulling up and scattering of rubbish. It is *especially adapted* to inverted sod, hard clay and "slough land" where other Harrows utterly fail, and also works perfectly on light soil. Send for circular.
NASH & BROTHER, Sole Manufacturers,
HARRISBURG, Penn. and 22 COLLEGE PLACE, NEW YORK CITY.

Miscellaneous.

ST. JACOBS OIL
TRADE MARK.

THE GREAT GERMAN REMEDY.
FOR
RHEUMATISM,
Neuralgia, Sciatica, Lumbago,
Backache, Soreness of the Chest, Gout, Quinsy, Sore Throat, Swellings and Sprains, Burns and Scalds, General Bodily Pains,
Tooth, Ear and Headache, Frosted Feet and Ears, and all other Pains and Aches.

No Preparation on earth equals ST. JACOBS OIL as a *safe, sure, simple* and *cheap* External Remedy. A trial entails but the comparatively trifling outlay of **50 Cents,** and every one suffering with pain can have cheap and positive proof of its claims.

Trumansburg, N. Y.
Also Manufacturers of Lawn Mowers, Plows, &c., &c.

Protect Your Health.

Cold and moisture combined have a torporising effect upon the bodily organs, and the digestive and secretive processes are apt to be more tardily performed in Winter than in the Fall. The same is true, also, of the excretory functions. The bowels are often sluggish, and the pores of the skin throw off but little waste matter at this season. The system, therefore, requires opening up a little, and also purifying and regulating, and the safest, surest and most thorough tonic and alterative that can be used for these purposes is Hostetter's Stomach Bitters. Persons who wish to escape the rheumatic twinges, the dyspeptic agonies, the painful disturbancies of the bowels, the bilious attacks, and the nervous visitations, so common at this time of the year, will do well to reinforce their systems with this renowned vegetable stomachic and invigorant. It improves the appetite, strengthens the stomach, cheers the spirits, and renovates the whole physique.

The MAPES COMPLETE MANURES.

SPECIAL CROP MANURES,

MANUFACTURED BY

The Mapes Formula and Peruvian Guano Company,

158 Front Street, New York.

Wheat and Corn in Ohio.

Wheat *more than doubled on land that had produced five successive crops. Was the heaviest, and ripened first.*

Corn. *One bag of the Mapes Corn Manure per acre, produced the best crop raised in twenty-five years. These manures pay.*

W. H. HEFFELMAN, DOYLESTOWN, WAYNE CO., OHIO, November 19th, 1880, reports—

I used the Mapes Complete Manure (light soil) on my wheat last fall (1879), 200 lbs. per acre, drilled in. It grew, and went through the Winter well. On strips, where I did not use any wheat manure, the wheat "froze out" badly. Where I used the Mapes Manure it ripened first, and was the heaviest wheat I had, and that on land which had borne five successive crops. The yield was over double that of natural soil. The berry was bright and plump, and weighed more than any other wheat. I also used 200 lbs. of the Mapes Corn Manure, drilled in and on both sides of the row; I had the best corn I have raised in twenty-five years. My neighbors, who used your manures, say that they pay them well. I am well satisfied.

Cabbage, Corn, Potatoes and Turnips.

"Have used the Mapes Manures six years, and am ENTIRELY SATISFIED *that they are permanent in results, and there is* NO *exhaustion of the soil by their use."*

Used somethirteen tons during present year, and propose to use some twenty tons next season.

BENJAMIN P. VALENTINE, FLUSHING, QUEENS CO., L. I., Oct. 4, 1880, reports—

CABBAGE.—Applied one-half ton per acre of the Mapes Cabbage and Cauliflower Manure on sod, mowed the same year, plowed once and plants put out. Applied the fertilizer in drills mixed with soil and covered with a coverer. No other manure used; soil, a good loam; season, favorable. Yield was of fine quality, and fully as good as I have had with fifty dollars worth of horse manure.

CORN.—Used 400 lbs. per acre of the Mapes "A" Brand Manure applied broadcast, nothing in the hill. Soil, part hilly and poor, and part good. Yield, seventy-five bushels shelled corn, fine quality, with few nubbins.

POTATOES.—Used 500 lbs. of the Mapes Potato Manure in the drills, also fifteen two-horse loads horse manure broadcast; soil, a good loam; season, very poor. Yield with the Mapes one-fourth more than where stable manure was used alone. Quality of the potatoes was fine and smooth where the fertilizer was applied, but rough and grubby where the stable manure was used.

TURNIPS.—Only 200 lbs. per acre of the Mapes Cabbage and Cauliflower Manure applied in drills; no other manure. Soil, part good and part poor. Had a fine crop; beat stable manure by far even with this small quantity of the fertilizer.

Mr Valentine writes, with the report: "Herewith find draft three hundred and fifty dollars, balance of my account of six hundred and twenty-three dollars ($623) for the Mapes Manure used on my farm during the present year."

"I am satisfied with the results, and so much so, that I shall require in the neighborhood of twenty tons for the next season."

"I append same results—have used the Mapes Manures six years, and *am entirely satisfied* that they *are* permanent in results, and that there is *no exhaustion* of the soil by their use."

Cauliflowers.

"Have used the Mapes Manures since 1877—am well satisfied with them—land is improving in condition all the time"

Land in 1877 too poor to raise grass enough to feed a cow, and now in high condition. Has only used the Mapes Manures

SAMUEL BROWN, MATTITUCK, SUFFOLK CO., L. I., Feb. 16, 1881, reports—

Soil, a good light loam; season, favorable; crop, cauliflowers, planted in July. Applied broadcast one ton of the Mapes Cabbage and Cauliflower Manure, and 600 lbs. of potash salts ($5 00). Yield, 401 barrels of cauliflowers on two and one-half acres. I lost 40 barrels left in lot and frozen in. The crop was of extra quality, large and fine heads.

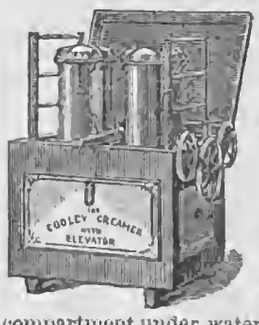
The land was in good condition, but this was from previous use of the Mapes Manure since 1877. I do not use stable or farm manure.

Remarks.—"Have used the Mapes Manures since 1877—am well satisfied with them. Land is improving in condition all the time. Have more corn this year, after fattening my hogs, poultry, etc., all Winter, than I ever had before from even more land. When I took this land it wouldn't yield enough grass to feed a cow. Have used no manure except from your representative at Mattituck since 1877, when I gave him the first order here, and my farm is in high condition to-day."

☞ The above reports are from pamphlet 1881. Send postal for pamphlet.

COOLEY CREAMER.

GOLD MEDAL, PARIS, 1879.



Butter made by this Process was awarded **Sweepstakes** at International DAIRY FAIR, 1878, and **Gold Medal** at same Fair, 1879.

Gold Medal at Royal Agricultural Exhibition, London, 1879.

MANUFACTURED in FOUR STYLES and TEN SIZES.

THE REGULAR.—The cans in this, removed to bench for skimming automatically.

THE JUNIOR.—Skimming done automatically without removing cans. THE UPRIGHT OR CABINET.—Has a compartment under water tank, the illuminated conical point of cans projecting into this compartment, skims without removing cans.

THE ELEVATOR.—Has a hoisting arrangement for raising cans out of tank. Milk drawn off automatically before removing cans form platform of elevator.

They require no milk-room. They raise all of cream between milkings. Impure air, dust or flies cannot reach milk set in them. The cans are submerged and water sealed in each style.

Each style has transparent panes for the purpose of determining when the milk is out, and cream about to flow. Our patents cover these processes.

No others have a right to use them.

☞ Send for "DAIRYMAN" giving particulars.

ENSILAGE—ITS APPLICATION TO MILK AND MEAT PRODUCTION.

PROFESSOR E. W. STEWART.

STOCK FEEDING, for one purpose or another, is the greatest agricultural industry of the United States, the dairy and beef, pork, mutton and wool products of which amount to a round thousand millions per year. Any improvement in feeding which shall cheapen this immense production even five per cent. is well worthy of careful consideration. Every stock feeder considers himself fortunate when the long Winter is over and his animals begin to feed upon the fresh, vigorous-growing grasses in Spring. Their old coats disappear and the fine, silken, glossy covering indicative of thrift and health, returns. Grass is the typical food of our domestic animals. "All flesh is grass," and the great study of the stock-husbandman has been how to preserve grass in the best way for use during the cold season. The term "grass" in its broadest significance includes nearly all our cultivated grains—Indian corn, sorghum, millet, etc., as well as our meadow and pasture grasses. The old and universal method of preservation by drying increases the woody fiber so as to render it much less digestible than in its green state.

Antiquity of Ensilage.

Some 20 years ago the custom of Austro-Hungarian farmers of pitting green fodder in the earth began to attract attention. It had been practiced by them for 50 years or more; in fact, according to some of the early Roman agricultural writers, grain and fodder were pitted by the farmers of Italy at an early period of history. So the modern silo is not quite a new discovery, but rather the improvement of an old one. This practice of the Hungarians spread into Germany and thence into France. The latter country has made the greatest progress in its application. The Hungarian and German silos were simply pits dug in dry places of earth, eight to ten feet wide at the top, six to eight feet wide at the bottom, six to eight feet deep, and as long as suited the convenience of the makers. The green fodder—Indian corn, rye, rape, vetch, clover, or grass—was laid in the pit, trodden firmly on the top and piled some five to eight feet above the surface of the ground, like the cone of a potato heap. This top was covered with straw, and then the earth thrown out of the pit was banked upon and over the top to the depth of 18 to 24 inches. This covering of earth was compacted so firmly as to exclude the air, and furnished a heavy cover which settled with the fodder in the pit; but in settling it was liable to crack and let in the air, so that attention was required to fill these cracks and compress the earth.

The French greatly improved upon the system of silos by building solid, air-tight walls of masonry above ground, or partly above and partly below the surface of the ground; and, instead of covering the top with earth, a weighted cover of planks is used, which settles with the fodder in the silo, giving a constant pressure, and thus excluding the air without liability of mixing dirt with the fodder. This cover, with constant pressure, is the great improvement made by M. Auguste Goffart in the silo; and to him also is the system of ensilage indebted for the practice of cutting the green fodder into short lengths so as to cause it to pack more solidly in the silo, and when taken out to be in convenient form for feeding. When this form of silo is operated expertly the green food should not pass beyond the saccharine stage of fermentation, and when taken from the silo and exposed to the air the alcoholic fermentation soon begins. In this state the ensilage (preserved fodder) is in its best condition for feeding, and its food value is probably equal to what it would have been at the time of packing in the silo—that is, the changes have improved its digestibility as much as fermentation has reduced its weight of dry substance. Some have figured an increase in food value, but this would be equivalent to the production of *something* from *nothing* unless the increase is produced by a chemical change which renders some of the constituents more digestible or palatable.

Plan of a Silo.—(See Page 222.)

That our readers may get a clear idea of the plan of building silos, in convenient form, of concrete, we give the outline of a ground plan for a triple silo—the inside of each being 16 feet wide by 32 feet long and 16 feet deep.

8, 8 represent the standards—three by six-inch scantling—placed inside of the proposed walls, edges to the wall, making them stiffer sidewise. These standards are placed mostly in pairs (one on each side of the wall) and three inches farther apart than the wall is to be thick and reaching some inches above the top of the wall (about 17 feet long). The pairs of standards are about eight feet apart. The boxing planks (represented by the lines inside the standards) may most conveniently be one and a half inch thick by 14 inches wide and 16 feet long, except those on the outside of the end walls, which must be 17½ feet long. The walls, being 16 feet high, should be 16 inches thick if made of concrete. Wall made of concrete is stronger than an ordinary stone wall built by a mason. The doors are represented by the letters d, d, d. The boxing planks extend across these doors.

We give a plan for a triple silo because many farms require storage of this capacity (about 185 tons for each silo, or 555 tons), and if less storage is needed, two may be built, or one if that is all that is needed. If more than one is required and less than two of this capacity, then it would be better to build two side by side, 25 feet long, than to build one 50 feet long. The latter would take 23 feet more in length of wall: besides, the two silos side by side would be more convenient, the doors being near together. The roof on this ground plan would span the silos lengthwise, and another silo could be added at any time, requiring only one side or long wall and two end walls, and the roof can be extended over the new silo. This plan, then, permits one to be built as a trial silo and others to be added at any time without any change of plan. This form of silo may be placed with the door end near the drive-way into the basement stable. A track laid from the silo door and a car run into the silo will enable one to deliver the ensilage before the animals. This car may hold a feed for the whole stock and be readily moved on the track by one man at any time.

Building the Silo.

For convenience of filling, the silo may be sunk half its depth in the earth, where the situation permits this to be done with good and easy drainage. But if the soil is springy, or if the silo is to be sunk in slate or shale rock which permits the water to pass freely through it so as to produce a pressure of water on the bottom, it is difficult to make the bottom water-tight without cutting a free drain on the outside of the wall and some inches below the bottom, so as to conduct the water off. It is better not to go deeper in any case than can be easily drained. It is also most convenient not to have the bottom of the silo below the level of the feeding floor of the basement stable. If two to four feet are excavated, this earth can be used to bank up on the back end of the silos for an elevated drive-way for setting the cutter or for delivering the green fodder. The excavation should be at least 18 inches beyond the proposed wall for convenience of working. Having got the bottom leveled, set the standards 19 inches apart (this will give a space between the boxing planks of 16 inches), care being taken that the edge of the inside standard next the boxing be straight. To hold the standards firmly in place, nail a lath across the under ends; this will prevent them from spreading, leaving the lath under the wall and offering no obstruction to the removal of the standards after the wall is built. Now a bracket should be nailed across the top and the pair of standards set accurately plumb on the inside edge and solidly stay-lathed in that position. When the standards are all set about the proposed walls, and the boxing planks are all placed, we are ready for

Preparing the Concrete.

The first tier on the bottom of the wall should be made wholly with water-lime concrete, as follows:—Mix well one part of Akron or Rosendale cement with three parts of fine sand, while dry. You may now mix in also three or four parts of clean gravel; now mix into thin mortar, and place a layer of this mortar, two or three inches thick, in the bottom of the wall box, and if you have cobble or rough stones, or any irregular stones picked from the field, bed these in the mortar, taking care not to let them come quite out to the boxing plank. Use all the stone you can get in, taking care to have a layer of mortar between them; tamp it all down solid so as to have no spaces in the wall. Fill the boxing to the top, using a layer of mortar and a layer of stone alternately.

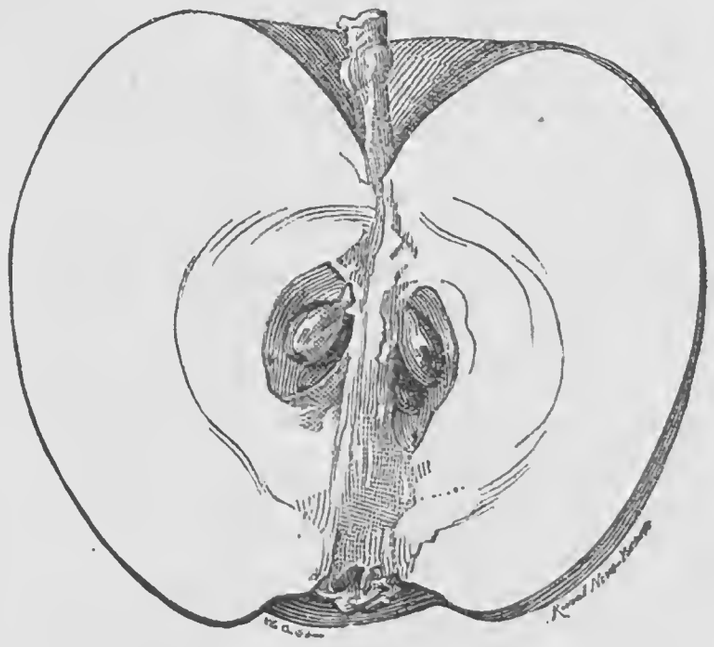
For the next layer of wall, and all above, mix as follows:—One part of cement with six of fine sand, while dry. Mix in four parts of gravel as before. Have a vat of quick-lime, well slaked under water, standing near, and use this thin milk of lime to wet up and mix into mortar the water-lime, sand and gravel. Make a calculation so as to get about one part of dry quick-lime to eight of sand used. Being mixed up into thin mortar, it will not be difficult to get the milk of quick-lime mixed thoroughly through the mass of mortar. The quick-lime should be slaked under water several days before using. This quick-lime will improve the walls and when hard will be water-proof. This will give, if stones are also used, about one part of water-lime to 13 or 14 of sand, gravel and stone, and one of quick-lime to about 15 of other materials. This wall will be cheaper than one built wholly with water-lime.

The boxing planks, after the first layer has become hard, are raised just 12 inches, leaving a lap of two inches on the wall below. The mortar is then put in the wall-box and stone bedded in as before, and the tiers are carried up in this way to the top. The standards may be kept from spreading in the middle by having a movable clamp hooked across, some feet above the boxing.

Plates eight by ten inches are placed on the top of the silo walls, and when the boxes are leveled for the top layers of the walls, three-quarter-inch bolts, 21 inches long, with screw or nut on the upper end and a square bend on the lower end, are used. Place three of these in each long wall—one in the center of the wall and one near each end, 12 inches from the end wall. Let the bolt go 13 inches down into the wall. To hold these bolts while filling around them, bore a hole in a narrow strip of board and tack this board across the top of the box just where the bolt is to be placed, the upper end of the bolt being put through the hole in the board, standing perpendicularly and eight and three-fourths inches above the box, so as to take the plate. These bolts will be in line, so that holes may easily be bored in the plates to receive them.

These plates are framed for short posts, two and a half or three feet long, upon which six-by-six-inch plates are placed for the roof to rest upon. This space between the top of the wall and the roof is usually occupied by swinging doors, which are closed after the silo is filled; and when it is desired to get as much as possible into the silo they are closed and the ensilage is piled above the wall two or three feet before the weighted cover is put on, and the compressed ensilage only sinks a very little below the top of the wall.

The inside of the walls of the silo is given an even coat of cement, thoroughly troweled down. The bottom is also cemented so as to make the whole air and water-tight. The doors should be double—one hung inside and the other outside. The inside door should be hung so as to shut even with the inside wall, be in two parts, and swing out. Felting should be placed on the jams so that the inside doors will shut air-tight. The outside door should be made in three parts, fastened together with hinges, the upper part only 10 inches wide and should be fitted to the outside jams of the door so as to be screwed fast, one section at a time, beginning with the lower section. The space between the two doors should be filled with sawdust, packed in, and the upper section is so narrow that the sawdust can be packed closely to the top and thus make the doorway air-tight.—(Concluded next week.)



THE PRIMATE APPLE.—Fig. 179.

WHAT ABOUT SILOS?

No doubt hundreds of the readers of the RURAL are seriously considering the question whether or not to build a silo and sow corn fodder enough to fill it. Many certainly are looking to us to find encouragement to go ahead and spend $300 to $500 in putting down a pit or building a silo, and in preparing for making *sauer-kraut* for cows on a great scale.

The RURAL is certainly not blindly conservative. It sees good in new things all the time; in fact, it may be regarded as progressive some-

times to the verge of rashness, but in this matter it must still advise caution.

We certainly add nothing to the corn fodder by tanking it, and we lose very little by drying it. We may certainly consid r to advantage the different ways of treating and feeding corn fodder.

To those who feed either store cattle or milch cows in the Winter, corn fodder offers an article of forage too valuable to be neglected. It is much more valuable than what we commonly call "corn-stalks"—that is, the straw or stover of corn which has ripened.

Corn-stalks are always well-cured if handled in the usual way; that is, cut up just before frost; "stooked" at once and left to dry and cure in the stook exposed to all vicissitudes of weather. By the time the cars are fit to husk, the stover may usually be bundled and stacked; at any rate, if left a few weeks in larger stooks, it will be well-cured with very little labor.

It is exactly so with corn fodder. It should be sown so late that it will not be over-ripe by the time we expect frost—say the 15th of September. Then it should be cut up and stooked, without binding, in bundles, so that the air can go through it, the stooks being bound at the top. Later it may be bundled and stacked. There will be no molding, the leaves will be bright and green, the odor sweet.

The fact that corn fodder, when it is cured and secured for Winter use among common farmers, sells for about the same price as corn-stalks, is no evidence of the comparative value of the two articles. The corn fodder is certainly much more valuable. We have few analyses of corn fodder, and no comparative experiments in feeding by which its feeding value has been accurately determined. It is recognized as good fodder for milch cows, especially if fed with corn-meal, bran, or oil-meal of some kind, and it has the reputation of exciting a flow of milk.

When well-pitted or "ensilaged" it is wholly eaten, and, if fed with suitable additions of grain-feed, is fattening and gives a good yield of milk. The disadvantages connected with "ensilaging" maize are, 1st, the handling of enormous quantities of water and, 2nd, considerable loss of nutritive elements, and the danger of very great loss if the process be imperfectly done, or the fodder (ensilage) be exposed too much to the air after the pit is opened.

An admirable system of feeding corn fodder has for several years been followed at the Michigan Agricultural College, and it seems to give quite as good results as "ensilage." It is this: the fodder is cured in the ordinary way, and, when fed, is cut by horse power into pieces two or three inches long. It is spread out over the floor in a confined space about six inches thick. Over it, to the depth of about three inches, *pulped* mangels or sugar beets are spread. These are "pulped" as fine as apple pomace, by an English machine called a "root-pulper,"—we know of none manufactured in this country.

These layers of corn fodder and pulped roots are repeated until the mass is several feet in thickness, when it is compacted somewhat by tramping and covered with a piece of canvas or similar covering. A heat soon comes on and after two or three days, according to the weather, it is ready to feed, and is given to the cows steaming. The quantity made at once should be enough to last three days; for if kept longer it may become over-heated or too sour. Meal or bran, or any provender of the kind, may be added when the heap is made, and very little loss takes place if the mass is fed before it heats too much. The whole is eaten, and, so far as we can see, a better control of the fodder is had, with less expense of labor and apparatus than is required for "ensilage." The practical question as to which system gives best results can not be discussed—for we have no comparative results.

ECONOMY OF USING APPETIZING FOOD FOR FATTENING ANIMALS.

PROFESSOR F. H. STORER.

It is not a little interesting to observe how the gradual introduction into this country of the European process of preserving green fodder in pits is likely to direct renewed attention to the real significance of palatable food, just as was the case some years since when the idea of steaming fodder was prominent. It was thought, indeed, at one time that the process of steaming fodder increased its digestibility and that a part of the merit of steaming depended upon this supposed fact as well as upon the palatableness of the steamed food; but now that it is known that the digestibility of the components of hay and straw is not increased by steaming, the true significance of the appetizing character of the steamed food has become all the more apparent. The chief merits of steamed food consist clearly in its softness, warmth, and especially in the agreeable flavor which is easily imparted to it by additions of meal or the like and because of which animals are induced to eat it freely.

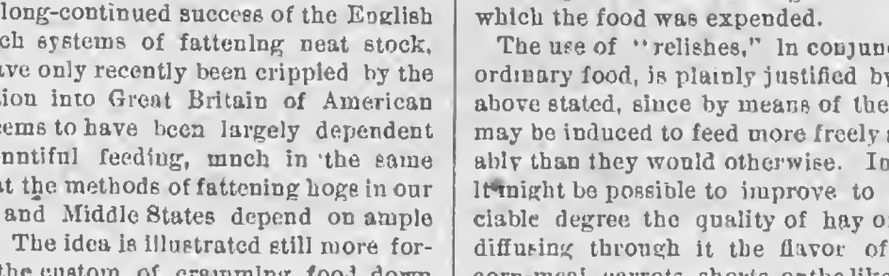
But manifestly, in so far as flavor is concerned, that may be got in other ways than by steaming. Animals may be made to eat largely both by incorporating appetizing flavors with their rougher food and by feeding out to them daily a variety of foods, the less palatable being placed before them first and the more palatable later, after their appetites have begun to flag. It has long been recognized, in some of the best agricultural districts, that in fattening animals it is good economy to give them so much and so palatable food that they shall be induced to eat the largest possible amount of it. The long-continued success of the English and Scotch systems of fattening neat stock, which have only recently been crippled by the importation into Great Britain of American cattle, seems to have been largely dependent upon bountiful feeding, much in the same sense that the methods of fattening hogs in our Eastern and Middle States depend on ample rations. The idea is illustrated still more forcibly by the custom of cramming food down the throats of geese and other poultry, which prevails in some parts of Continental Europe. And this custom is specially interesting since the successful results obtained by it go to show that the powers of digestion in an animal must be greater than its natural capacity of eating food. If animals can be safely crammed with food by actually forcing it down their throats, there would seem to be no great risk in tempting their appetites to the utmost, for, let us do our best, we are not likely to reach in this way the limit of their powers of digestion. It is important to remember, in this connection, that, as regards any one single fodder, such as hay for example, the percentage amount of it digested remains essentially the same, no matter whether the animal receives much or little of it.

The foregoing systems of forcing the process of fattening are not only justified by their practical results, but scientific investigations go to show that there is sound sense in the idea of inducing fatting animals to glut themselves with food. That is to say, it has been shown by experiments that the gain of flesh in the process of fattening is relatively larger when animals are luxuriously fed than when their rations are merely liberal. For example, the German chemists Henneberg and Stohmann fed a 1400-pound ox on a ration composed of 11 pounds of clover hay, 11 pounds of wheat straw, 10.34 pounds of cracked horse beans, 3 41 pounds of sugar, 0 44 pound of rape-seed oil, and 0 165 pound of salt, and found that 0.68 pound of actual flesh (albuminoid matters) was deposited within the animal every day. They then increased the ration so that it consisted of 11 pounds of clover hay, 11 pounds of wheat straw, 12 87 pounds of cracked beans 3 08 pounds of starch, 0.66 pound of rape-seed oil, and 0.165 pound of salt; but as a consequence of this change the daily gain of actual flesh rose to 1 31 pound. The ratio of albuminoids to carbohydrates in the two rations was almost precisely the same, viz. 1 to 4 3 and 1 to 4 2, respectively. The real difference between the two rations was that the amount of digestible food was considerably larger in the second than in the first. The animal was found to have digested 19 65 pounds of food per day in the one case and 21.41 pounds in the other. Yet for every 100 pounds of albuminoids digested, only 18 pounds were deposited as flesh in the first instance, while 32 pounds were deposited as flesh in the second instance.

The same thing was seen in some experiments where nothing but clover hay was fed out, in larger and smaller quantities. An ox fed upon 22.44 pounds of clover hay and 0.11 pound of salt, gained 0.132 pound of flesh per day; but when fed upon 27.5 pounds of the clover hay and 0.11 pound of salt he gained 0.275 pound of flesh per day. In the one case the animal digested 9.87 pounds of food, and in the other 12.84 pounds. For each 100 pounds of albuminoids digested there were deposited 14 pounds of flesh from the more abundant ration and nine pounds from the more moderate allowance.

Yet again, an ox fed on 26.51 pounds of clover hay and 0.11 pound of salt, digested 11.47 pounds of food and gained 0.21 pound of flesh per day; and when fed upon 31.9 pounds of clover hay and 0.11 pound of salt, he digested 14 32 pounds of food and gained 0.34 pound of flesh. For every 100 pounds of albuminoids digested, 11 pounds of flesh were deposited from the smaller and 15 pounds from the larger ration. In all these trials, the deposition of flesh was larger when the ration was most liberal and the gains obtained by increasing the rations were got in a highly advantageous way, economically speaking, since the rate of gain of flesh was larger than the rate at which the food was expended.

The use of "relishes," in conjunction with ordinary food, is plainly justified by the facts above stated, since by means of them animals may be induced to feed more freely and profitably than they would otherwise. In this sense it might be possible to improve to an appreciable degree the quality of hay or straw by diffusing through it the flavor of oil-meal, corn-meal, carrots, shorts, or the like, although the actual amount of the addition, when regarded merely as food, might be well-nigh insignificant. In the same way as these relishes, ensilage, steamed hay, and sweated hay undoubtedly do good service by provoking the appetites of animals. Some farmers have been not a little puzzled, at one time and another, to account for the fact that better results are often obtained on feeding out hay which has undergone some slight fermentation by curing in cocks, than can be got from the same sort of grass cured quickly and to all appearance as nicely as possible in the swathes where it is freely exposed to air and sunlight. Of course there is a liability of losing a larger proportion of the better parts of the hay, by the crumbling of delicate leaves, in the process of sun-drying, and particularly with clover



PLAN OF A SILO.—FIG 180.

than in the other case where the hay is cured in cocks, but there is nevertheless a real advantage to be credited to the incipient fermentation, in that cattle usually prefer such hay and eat it more freely.

Pomological.

THE PRIMATE APPLE.

The Primate Apple is the best Summer apple we have. It is of medium to large size; skin yellowish-white, often with a handsome blush on the cheek exposed to the sun; flesh very tender and crisp, of a pleasant sub-acid flavor, excellent for dessert or cooking, and ripens gradually for a long time. Last season it ripened as early as the middle of July, and was in use for at least two months. The tree is a stout, vigorous grower, a good and early bearer. If any one has but a single tree it should be the Primate. Its origin is, according to Downing, unknown. It must be over 30 years since I obtained and set grafts of it under the name of Sour Harvest, and not until I had grown and fruited the Early Harvest did I learn the difference. I suppose in this county at least, and I think in the State, nine out of ten, if not 99 out of 100, who know it at all, know it only as the Sour Harvest, and if they were ordering a tree of a nursery they would order this by that name; and if they got an Early Harvest, which the nurseryman would be justified in sending, they would pronounce him a fraud when the tree came into bearing. It is not an uncommon thing to find a fruit attain greater celebrity under a wrong or improper name than under the rightful one. For instance, the White Doyenne Pear was long and widely known in this State as Virgalieu, and thousands of old residents know it by no other name to this day. The New Rochelle Blackberry attained its greatest notoriety under the name of Lawton, and the Pine Apple was the popular name for the Scotch Runner and Crimson Cone Strawberries. E. Williams.

Montclair, N. J.

Primate.—Mr. J. J. Thomas says of this apple that it is "medium in size, light-green, becoming light-yellow, often with a slight blush; fine-grained, very juicy, with a very agreeable mild sub-acid flavor. Ripens for several weeks through the latter part of Summer. Valuable." According to the best information we can glean, it succeeds well in Massachusetts, Michigan, Louisiana, and fairly well in Maine, New Hampshire, Rhode Island, New York, Ontario, Pennsylvania, New Jersey, Maryland, Ohio, Indiana, Illinois, Nebraska, Missouri, Utah, California and Mississippi.—See first page.

MORE ABOUT THE EARLY TILLOTSON PEACH.

In the Horticultural Department of the Country Gentleman, of the 10th of March, the Editor takes occasion to criticise my remarks, in the Rural New-Yorker of February 5th, respecting the Early Tillotson Peach.

I freely admit the undoubted ability of the critic to communicate rare and valuable information on this, as well as on most other subjects pertaining to horticulture; and that, in the article alluded to, he communicates some facts not generally known. I do not attempt to discuss the matter through the editor's own columns, for the reason that I long since learned the futility of attempts to meet such a dignitary on his own "stamping ground." My reason for giving it attention will be found in the fact that the criticism seems to proceed upon the assumption that I have spoken hastily, and even incorrectly upon the subject.

I intentionally left the date of the introduction of this peach indefinite, fixing it about 1845 or 1850. Exception seems to be taken to the remark that this peach came before the public "with quite a flourish of trumpets." To this I reply that, in January, 1848, (Genesee Farmer, pages 58 and 59,) David Thomas, replying to a query of the previous month, says: "In our heavy loam the fruit has always been *very fine*, when the ground has been well cultivated; and *earlier* than any other valuable sort in my collection, except the *Early Ann* which ripens three or four days before it." * * * "Had I only known of its excellence in time, and planted it as extensively as I might have done, it would have yielded me, this season, a large sum." This was practically indorsed, at the time, by P. Barry, who was at that time the conductor of the Horticultural Department. The only other notice of this peach of any special import in this connection, is the description supplied by Mr J. J. Thomas, as he states, to A. J. Downing, for insertion in the first edition of his "Fruits and Fruit Trees of America;" and which appears on page 475 of that work. This edition is dated 1846; the date of the preface being May, 1845 In this description, Mr. Downing (in introducing it) remarks: "The Early Tillotson is unquestionably one of the most desirable of all the very early freestone peaches." And Mr. J J. Thomas, in his description, says: "It is much higher-flavored than any peach that ripens previously, or for some days after it, and as a garden variety, is entitled to universal favor."

Although, as I well knew, this peach had been long known locally, it was assumed, as I still believe, that up to the period named, it had not become generally and favorably known away from Central New York. I also take occasion to remark that the era of extended advertising and extravagant puffing had hardly yet dawned upon the horticultural world; hence I claim to be warranted in the remark, as applied to that period, that this was, in fact, "quite a flourish of trumpets."

Facts possibly may not warrant the assumption that the period named is properly that of the introduction of the variety to the pomological world; but I am not yet convinced of error in this particular. T. T. Lyon.

Field Crops.

TOBACCO CULTURE.—NO. 5.

G. A. GOFF, JR.

"Worming."

Very soon after tobacco plants commence growing in the field they are usually attacked by the tobacco worm—Sphinx Carolina. This worm, which is so well known by tobacco growers, is the larva of a dusky, brown-winged miller, nearly as large as a humming bird, which may be seen flying through and about tobacco fields on warm nights in July and August, depositing its small, greenish eggs on the surface of the tobacco leaves. The worm, when first hatched, is very small—not more than an eighth of an inch in length; but it commences its work of destruction immediately and in five or six days has gained such a size as to be readily seen. Up to this time the damage done to the tobacco is small; but at this stage of its existence the worm undergoes a change, throwing off its old coat or skin and coming out in a new dress. From this date on its growth is very rapid and unless something is done to prevent its ravages on the plants, the damage to the crop will be very serious. A large worm will sometimes render a plant utterly worthless in a few days, hence

the importance of destroying the pests while they are small. There are usually two crops of worms, the first coming on in the early part of July while the plants are young. The second crop appears usually about the middle of August and is generally more destructive to the crop than the first brood, as at this time the plants are so large as to make it very difficult to find them. "Worming" tobacco is a very laborious and costly task in seasons when the worms are numerous. It is a work, however, which must not be neglected if a good crop is to be expected, for the quality and quantity of the crop depend largely upon it. Various means have been adopted for destroying tobacco worms, but of them all none is so effectual as picking them off by hand and destroying them. Turkeys will devour them greedily and are very useful to aid in the work of hunting and destroying them, yet the chief reliance must be placed on hand-picking them. It is supposed that worms are less numerous in the Summer succeeding a wet Fall. They are also less numerous in wet rainy seasons, when the continued heavy rains wash off the eggs in large numbers. They are always present, however, in numbers sufficient to cause great damage to the crop, unless the utmost vigilance is employed in destroying them. In seasons when they are numerous, the tobacco field should be passed over at least once a week, the leaves examined and the pests destroyed. A little experience will enable one to tell where they are most likely to be found. Eggs also should be looked for and destroyed. The work may be done by small boys with profit if a premium be offered to the boy who secures the greatest number of worms, or the searchers may be paid by the dozen or hundred, in which case it is best to have the pests collected in some kind of a dish or a vessel so that they may be correctly counted. A good way of lessening their number is to destroy the millers that lay the eggs. A method practised largely in some tobacco-growing districts is to plant Jamestown Weed in the vicinity of the tobacco field, the blossoms of which are eagerly sought after by the flies. Poison is injected into these blossoms, which poisons the miller and thus prevents it from depositing its eggs.

"Topping."

In order to throw the energies of the entire plant into a *few large leaves*, the top, or seed bud, which makes its appearance when the growth of the plant is nearly completed, is broken off; the process is called "topping."

The work requires some experience and judgment to perform it correctly. It is better that the plant be not permitted to blossom, and the sooner it can be topped the greater is the saving of vitality. Care should be taken in pinching or breaking off the top or bud not to injure the leaves immediately below. A common mistake made in topping tobacco is in topping too high. Low topping is advisable, as it gives larger leaves and better quality. From ten to fourteen leaves should remain on the stalk.

Spiked Wild Oat-Grass or Old Fog—Danthonia Spicata.

This is another grass of small size found on poor soil. The stems are short and few in number; the leaves short, twisted and generally hairy. The grass grows in small bunches and is not considered of good quality for any kind of stock. There are some 60 species of Danthonia, nearly all natives of South Africa, where they afford much valuable pasture. The species above is generally found on poor, thin, high clay soil. The late Hon. John Stanton Gould, in his excellent article on grasses, says he once gave this grass a good trial. "When it was fed to the cattle in the Winter, although the mangers were kept well filled, they bellowed with hunger. The horses became hide-bound and the cows shrank in their milk. They got along very well when they were fed twice a day with Timothy and Blue Grass and were allowed to pick at the Danthonia at intervals as they felt inclined for it. It was rather better than rye straw, but not much. It was certainly better than nothing; but the better plan is to manure the soil, so that it will produce the richer grasses." PROF. W. J. BEAL.

Horticultural,

RAISING CELERY.

IT is less difficult to raise good celery than is generally imagined. Ordinary skill, attention and judgment are all that are necessary to produce a good quality of celery, and we wonder that farmers do not more often attempt its cultivation. The first requisite is moderately good soil, not necessarily very rich, except immediately about the roots of the plants, and not too light and dry. The ground should be thoroughly and deeply worked, so that it will the better retain sufficient moisture for the growth of the young plants.

In the latitude of New York City and southward the seed may be sown in open ground in April. The soil should be well prepared and mixed with thoroughly decomposed farm-yard manure or some commercial fertilizer. Sow the seed thinly and equally; cover with half an inch of earth; slightly pack down; and water, if it does not rain in a few days after sowing. When the plants are one or two inches high, they should be transplanted into another bed—a few of the larger leaves having been taken off—and set about four inches apart but no deeper than before. In July the plants may be set in rows four feet apart and six inches apart in the row. It is not necessary to plant in trenches, but a little manure may be dug in along the furrow in which the plants are to be set. The time of blanching, though depending upon the time when the celery is to be used, is generally in September. A plow is run between the rows; the stalks must be gathered in one hand and the dirt pressed up against them with the other.

More earth should be thrown up against them with a hoe; but the tops must be left exposed several inches and, as they grow, more earth must be banked up against them.

The blanched plants are stored in a trench about one foot wide and just deep enough to contain them; packed closely and more or less heavily covered according to the severity of the weather.

CUCUMBERS.

EARLY cucumbers for slicing I plant in cold-frames with other plants, and when the latter are removed the cucumbers occupy the ground. I thus get a double use of sash. I do not believe in hot-beds for cucumbers. It is too much work to keep them supplied with water when they commence to bear. There is nothing like having them down on a level with old mother earth, where she can assist the clouds in watering them, provided we have the conditions right, which are: a rich soil and good cultivation. With regard to kinds of cucumbers, I have found Early Frame as good as any. I do not like Long Green Prickly. It does not make a handsome pickle, and is a small yielder. Early Russian is good for late planting.

Late cucumbers for pickles I have always found a profitable crop. I plant the main crop as late as the Fourth of July, as a second crop following peas, early onions, lettuce, etc. I always manure them in the hill, either with phosphate or well-rotted stable manure. When the latter is used I dig a hole eight or ten inches deep, and put in about a half bushel of manure, tamp it down solid, cover it with three or four inches of soil, and leave the "hill," when planted, a trifle below the surrounding surface. It then gets the full benefit of all the rain that falls, and, if I wish to water it, the advantage is apparent—the water all runs the right way towards the center of the hill. I hear a great many complaints from my customers every Fall as to the injury to their vines from dry weather, and in most cases I find they have planted them on raised hills. What their object was I never could find out. It is needless to add they were not readers of the RURAL. I also find another fault is in not keeping the vines picked clean; they need cutting every other day. I use a sharp-pointed knife and leave a half inch of stem on each cucumber. This gives them a tidy appearance when taken to market, and they are said to keep better; but of this I have no proof; but I do know that they should be either pickled or salted pretty soon after they are picked. Keeping them has a tendency to toughen the outside rind and cause them to shrivel up when put in the brine. One thing more I have learned from experience—not to plant in the open ground until the soil is thoroughly warm and warm nights are the rule, not the exception. About the 10th of June is early enough for this latitude. ADELBERT WAKEFIELD.

Oneida Co., N. Y.

SPIKELETS OF WILD OAT GRASS.—FIG. 181.

SPIKED WILD OAT GRASS—DANTHONIA SPICATA.—FIG. 182.

PEAS.

PEAS produce best on a light, rich, well-tilled soil, and a good crop may be raised with the application of but little manure. The soil, for the first crop, should be prepared as early as possible in Spring after the frost is out of the the ground, and the peas put in as soon thereafter as possible. Other sowings may be made at intervals of two or three weeks until July, if a succession of crops is desired. We prefer to sow the early, medium and late varieties at the same time, the peas thus being matured in succession, and the excessive heat, and, perhaps, drought of July and later, are avoided.

Peas, when grown in small quantities for private use, may as well be sown in double rows six or eight inches apart with a space between of about three feet in order to give room to bush the taller-growing varieties, and plenty of space to pass between the rows in gathering the crop

We believe that nothing is lost in bushing even the medium-growing varieties, as it gives them a neat appearance, keeps the vines from matting and trailing in the dirt, and, above all, keeps the good farmer from saying harsh things when, during a light shower or heavy dew, he is requested by the mistress of the the house to go out and pick a mess of peas on the plea: "We must have them for dinner." No one relishes the overhauling of wet, dirty vines, or the picking of the bespattered pods from those trampled beneath his feet.

EARLIEST VARIETIES:—Philadelphia is the earliest of all, and close upon it come Early Kent, Daniel O'Rourke, Laxton's Alpha, Carter's "First Crop," Kentish Invicta, and Tom Thumb. The last variety can be raised with least trouble and may also be said to produce least, as it grows but half a foot high.

EARLY:—McLean's Advancer, Laxton's Prolific Long Pod and McLean's Little Gem are good early varieties.

MEDIUM:—Champion of England, Laxton's Marvel, McLean's Premier, and Eugenic.

LATE:—British Queen, Black-Eyed Marrowfat, Tall Sugar, and McLean's Best of All. Champion of England for a main crop is still considered the best. This grows five feet high; the pods are large and well-filled. For an early pea there is none better than McLean's Little Gem.

Experience with new Vegetables.

Having seen several articles in the agricultural papers of late stating that the Alpha was a first-class tomato, I concluded to write and give my experience in the matter. Last Spring I procured two packets of this variety, and from the seed raised about 500 plants. These I set out in a favorable situation with a view of saving the seeds, thinking that if the variety proved valuable there might be a sale for it; but it proved quite the contrary. The plant itself is very weak-growing, even under high culture; the fruit is small, irregular in shape and very liable to crack and rot. It is one of the poorest varieties, without exception, I have ever seen. Among other varieties I tested the past season were the Acme, Paragon and Hathway's Excelsior. Of these I think the Excelsior is by far the best. It is very productive, solid and of excellent quality. The Acme and Paragon are very good; but in most cases will crack and rot to some extent.

I also tested some other novelties in the vegetable line, among which were the Golden Wax Bean, Red Drumhead Cabbage and Bliss's American Wonder Pea. This little pea is truly a wonder, being very early, highly productive and of excellent quality. The cabbage, though not a new variety, is comparatively unknown. It is a great improvement on the common Red Dutch, being larger and of better quality. The Golden Wax Bean is much better than the old Black Wax in productiveness and quality.

Shelburne, Vermont. W. H. B.

ON the 24th of April, 1875, the thermometer was 24 °, at seven in the morning, and the sleighing for that and the next day was good. Be not in too great haste to uncover plants Let the mulch still remain upon the strawberry patch. One cannot sow his Spring wheat and oats too early after the ground is dry enough to plow. But plants that have been protected during the Winter are tender now and need protection more than ever.

The Swine-Herd.

OUR ANIMAL PORTRAITS.

A Specimen Small Yorkshire Sow.

THE cut, fig. 185, represents a perfect specimen of the modern Small Yorkshires, a breed which originated in England, and has been brought to great perfection. They are pure white and excel in aptitude for taking on flesh and for easy keeping. The skin is very thin and the bones small. The heads and snouts are the shortest of any breed except the Suffolk. The animals are quiet and docile in disposition. The only objection to them is that they carry too much fat in proportion to the lean meat.

This sow, Marchioness, is the property of T. R. Proctor, Utica, N. Y., and is recorded in the Yorkshire Swine Registry as A 81. She was bred by W. H. Cole, Clinton, N. Y., by an imported sire, King John, bred by Wheeler & Sons, England, and he is out of Flora *85. She was farrowed April 22, 1878, and weighs 400 pounds. She has had two litters of pigs and had eight with her at the last New York State Fair, where she won the first prize in her class. During the same month she also received the first premium at the Oneida County Fair.

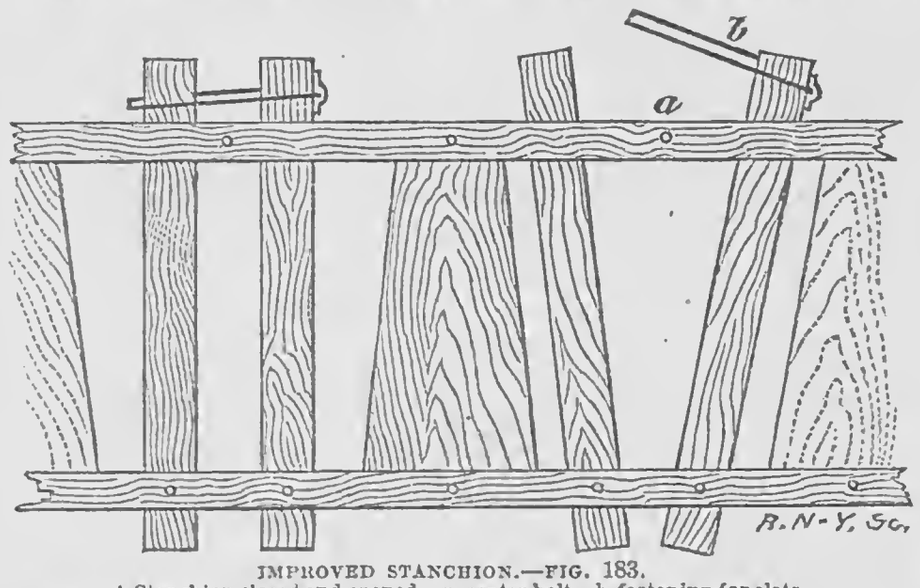
PIGS.

COL. F. D. CURTIS.

WHEN pigs are two or three days old, unless the mother has a surplus of milk, she may be fed succulent food to increase the flow. If she appears to have plenty of milk such food should not be given to her for at least a week in order that the inflammation in the udders may subside. The health of the mother and the growth of the young will depend very much upon the care and judgment exercised at this period. Many sows are injured at this time and the pigs stunted by the excessive feeding of the mother. We consider milk to be improper food, and would prefer nothing but clear water or house slops mixed with a little bran. At the end of a week more nourishing food may be given, gradually increasing the supply as the young pigs will demand more sustenance. Barley meal will make more milk than any other kind of grain. Oats rank next in value. They should have the hulls sifted out, as the sow will not eat this part of the grain which would be wasted, but which is excellent for young calves or cows.

Wheat shorts or middlings are good milk-producing food and are cheap and healthful for a sow suckling pigs. The best form in which either of these foods can be prepared is to mix them with milk. Hogs always relish their food best when slightly fermented, just enough to make it sour. A little milk will produce this condition, if mixed with the meal or bran the day before the food is required. By a little care and pains-taking a supply of fermented food may always be kept on hand. This labor will always pay well, as the pigs will do so much better on it. It is necessary to keep the appetite from flagging if they are expected to be thrifty. Abrupt changes of food or the failure of a steady supply are apt to produce derangement of the bowels, which is exceedingly injurious to young pigs. The little ones are sure to be affected by the condition of the mother; hence it is important that great care should be exercised in her food. Corn may be fed in connection with milk, but we consider corn alone the least desirable of any grain. We should prefer buckwheat rather than corn. Sugar beets or mangels may be fed with grain and will be found conducive to health and will help to keep the appetite good.

When the pigs are between two and three weeks old they will eat oats with their mother, and this is the best kind of grain to give them. They will eat more every day, and the quantity may be increased without any danger of injury. They will also eat corn, but if it is given to them it should be in limited quantity. Corn is more heating than oats and harder to digest, and is liable to produce an excess of fat which causes thumps; or it may cause inflammation of the bowels, which is fatal to young pigs. We have lost a number on this account and have learned from experience not to rely upon corn. Too much milk given to pigs will produce the same result. If the season will admit, a sow will do better if allowed to run out on the ground where she can obtain grass which is an antidote to diseases of the stomach and which will also help materially to increase the milk. Running out upon the ground will also arrest the thumps, which is more liable to affect young pigs when confined in a pen. This disease, so common among young pigs, may be known by the heaving of the sides or by the panting of the animals and their refusing to eat. We know of no medicinal remedy except the use of turpentine which should be administered daily, diluted with milk, in doses of a half teaspoonful and more, according to the size and age of the pig.



IMPROVED STANCHION.—FIG. 183.
A Stanchion closed and opened. *a*, center bolt. *b*, fastening for slats.

Frequent washing with soap-suds does pigs a great deal of good and should always be practiced if they get dirty. Young pigs will never thrive well in a filthy pen. If the dam is unclean the pigs are liable, when suckling, to get sore about the head and around their mouths, which will stunt them. When this is the case they should be thoroughly washed and oiled.

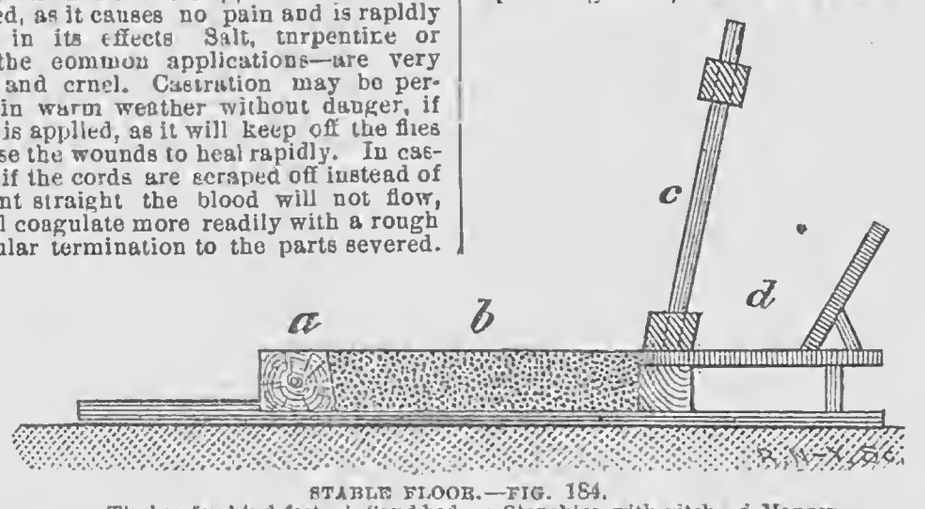
The male pigs should be castrated when four weeks old and the parts be smeared with coal tar, which is the best application we have ever tried, as it causes no pain and is rapidly healing in its effects. Salt, turpentine or ashes—the common applications—are very painful and cruel. Castration may be performed in warm weather without danger, if coal tar is applied, as it will keep off the flies and cause the wounds to heal rapidly. In castrating, if the cords are scraped off instead of being cut straight the blood will not flow, as it will coagulate more readily with a rough or irregular termination to the parts severed. This fact is more important in castrating older pigs. If the parts swell badly the incisions should be carefully opened so that the pus may pass out. Pigs, after castration, should be kept in a dry place, as exposure to wet may result in cold and inflammation, which are generally fatal.

Farm Economy.

IMPROVEMENTS IN COW STABLES.

THE article of Mr. Richard Goodman, Jr., on page 171, of the RURAL for March 12, is very valuable, and while his plans of neck straps, chains, oval head holes, etc., are perhaps excellent, and may be as represented, still the old-fashioned stanchion may, by slight modification, be made into a fastening that does not combine the oft-applied terms of "severe" "rigid" "inhuman" etc; but, which, on the other hand, is easy and secure; throw her body forward, which it is impossible for her to do with the perpendicular frame. With the two movable neck slats, the cow is enabled to move her neck side-ways the distance between the slats, and as there is usually a play of about two inches for her neck in the rigid stanchion, this added to the play of the slats, gives her a side motion of about nine inches—quite enough to relieve her from absolute "rigidity." The illustration is self-explanatory. There will be a necessity for a center pin, or a bolt at *a* to keep the play of the slats within bounds. The fastening for the slats can be made of a ⅜-inch rod, and when the slats are brought together, and this bale slipped over them, the fastening is most secure.

In regard to stable floors. I have my own notions, one of which is to put the planks flat upon the ground, and use absorbents so liberally that they are always dry. Where the cows stand I have a platform raised at least eight inches above the floor. At the proper distance back from the stanchion, I have an 8x12-inch oak timber laid flat-wise for the hind feet of the cows to stand upon, and then this space is filled with wet sand, and renewed until it has become packed solid. The cows are then kept bedded with litter, straw or any refuse of the barn. When the cows are "dry"—and Ohio dairies are so through the Winter—road dust gathered the previous Fall, or dry sand, or muck, makes excellent bedding, being great absorbents of moisture as well as deodorizers, and making an excellent bed besides. For several years the manure from my horse stable has been used as an absorbent, put behind the cows, and by this combination of manures, muck, straw, etc., the compost is highly improved in quality. JOHN GULD.



STABLE FLOOR.—FIG. 184.

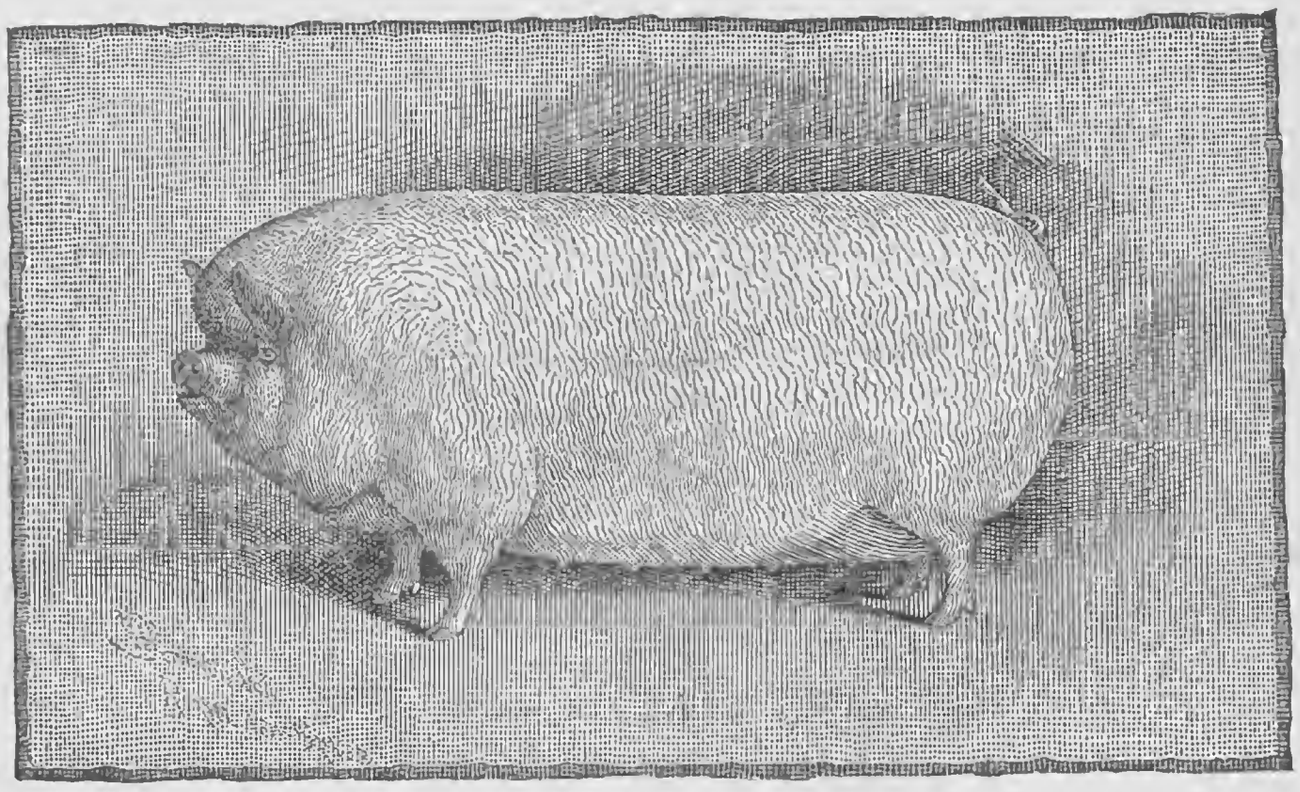
Three Horses Abreast.—(See Page 225.)

Having seen in a late issue of the RURAL a diagram of a method for working three horses abreast, I have decided to send you a model of a contrivance for this purpose partly invented by myself and partly copied from others. I have used almost every sort of device for the above purpose; but I have never found any that worked as well as this. It is now used on my brother's farm in Oakland Co., Michigan, one of the hardest places in the world for plowing. The diagram sets forth the principle and construction of the device so clearly that no further explanation is needed.

Marin Co., Cal. W. H. PHILLIPS.



MARCHIONESS.—FROM A PHOTOGRAPH.—FIG. 185.

while in regard to dispatch no fastening has ever equaled the stanchion. By observing the illustrations, it will be seen that the improved stanchion differs only in two respects from the ordinary one:— first, it is set with a pitch; and, second, the neck slats are both movable instead of one being rigid, as in the ordinary stanchion. The superiority of this improved fastening is obvious in many ways—the pitching forward of the top of the stanchion allows the cow greater freedom in getting up for the slant, and enables her to

Miscellaneous.

RURAL BRIEFLETS.

THE RURAL NEW-YORKER has published several communications to the effect that the St. Patrick and Burbank are the same potato. Mr. Isaac F. Tillinghast of La Plume, Pa. writes us that he has grown the former quite extensively and if any man can see, either in the appearance of the tubers or vines, any difference whatever from the already well known and popular Burbank, he has better faculties than Mr. T. . . . . .

MR. TILLINGHAST has grown the Mammoth Pearl, now extensively advertised, for two years. He says it is a large, nearly round, white variety very heavy and solid. The vines are exceedingly strong and it is very productive. He thinks, however, that its claims to earliness and fine quality have been a little over-estimated by some of its admirers. . .

MR. TILLINGHAST regards the new "Pride of America" as one of the best of Mr. Browne-ll's offerings. It resembles in color and shape the Snowflake but is with him a better cropper. We should hope so. The Snowflake is, at the Rural Farm, the smallest yielder we have ever raised. . . . . .

EVERYBODY, so to say, praises the Beauty of Hebron—and it is well worthy of its good name. Now for the WHITE ELEPHANT. Let us hope it may prove as good for a late as the Beauty is for an early potato. Probably not less than 30,000 trials of it will be made in this country the coming season and their reports will settle the question as to its value and the trustworthiness of the RURAL's claims for it. . . . . .

Mr. WALDO F. BROWN says, in the Ohio Farmer, that the Peabody Branching Corn is the same as Blount's White Prolific. We cannot say either that it is or that it is not, never having raised the former. We know, however, that Prof. Blount raised the corn bearing his name, for years, and is supposed to have made it what it is by careful cultivation; by emasculating the barren stalks; by careful selection etc. Perhaps he will inform us if originally it was the Peabody. . . . . .

"ONE thing I do wish you would do in the RURAL," writes Mr. C. M. Hovey of Boston, Massachusetts:

"Tell everybody that thimbleberries are not raspberries any more than currants are gooseberries. I am heartily sick of the Black Cap business and disgusted when I see respectable nurserymen advertising thimbleberries as raspberries. Do try and stop it. Let them stand on their own merit. Those who like Black Caps can get them in abundance, but those who think they can find the *delicious* aroma of the raspberry in them, can detect what I never did." . . . . . .

WE sometimes test new things and report upon them so long before they are popularized that the fact is often entirely forgotten. The American Wonder Pea is a case in point. This is now widely advertised and is becoming a genuine favorite. Yet this might just as well have happened a considerable time ago. In the RURAL NEW-YORKER of June 29, 1878 we find the following remarks under "Notes from the Rural Grounds." "In the way of peas American Wonder is an improvement, in its way, upon anything we have previously tried. The vines grow about 14 inches high and are vigorous, strong and prolific. The pods are about the size of the Philadelphia, well filled, averaging five seeds which are tender and sweet. Unless it is McLean's Little Gem, we prefer this variety to any we have yet tested." It is, according to our trial, a day or so earlier than the Gem. . . . . .

THE following offer is from our contributor Dr. T. H. Hoskins, of Newport, Vermont. We publish the note as received from him:—

"At the time I described the new hardy Summer apple, the Yellow Transparent, in your columns, I had scions to spare, though many applied for them. Now I have a few thousand on hand more than I have use for, and if you want to, you may say that any reader of the RURAL who will send stamps for postage and packing can have some as long as they last. I only recommend the variety for the "Cold North." The Middle States have numerous varieties quite as good. . . .

WE have to thank Mr. Edward T. Dyer of Providence R. I. for the following bit of information:

"Editors are supposed to know everything, so I will tell you something which you say you do not know. In Tilton's Journal of Horticulture Vol. V, Page 264, Mr. E. S. Rogers says:

"Salem, No. 53. This was originally numbered 23 in my private collection; but a spurious sort having been put into the market under that number, the number of this variety was changed to 53." . . . . . .

MR. HOVEY still regards his strawberry (Hovey's Seedling) as the best in cultivation—that is the best in the world. It received the highest prize for the best four quarts of any variety in 1880; also two years ago as the finest

strawberry in competition with all the new sorts. "I do not," he writes us, and we are not sure we should print any part of his letter, "eat any other myself—except the earlier sorts, such as Boston Pine and Jenny Lind and, for a late one, La Constante. These are all of 25 sorts I ever think of having on my table."

. . . . . .

MR. HOVEY has been accused for 30 years past of thinking his own things the best. "I suppose," he writes in another part "you know that when I introduced the Concord Grape all the Boston cultivators said it was 'only fit for jellies.'" . . . . . .

What Others Say.

OLEOMARGARINE IN ENGLAND.—The President of the English Board of Trade stated in Parliament some time ago, that oleomargarine had been declared by experts to be a wholesome article of food; wherefore its importation could not be stopped. The Mark Lane Express says: "We see not a particle of difference between meat, wheat, cheese, butter, poultry, eggs, or butterine; all are additions to our food supplies. If any one of them is unwholesome or injurious to health, the law is able to step in and destroy it. If they are sold for what they are not, the law is again well able to protect the purchaser who has been defrauded." This is certainly taking a very liberal view of the subject, and it shows that our English cousins are inclined to give us a chance to supply them with food in all its usual forms.

THE FIRST AND SECOND NEEDS OF A SOLDIER.—It is said, according to London Field, that when the Duke of Wellington returned from his hard-fought Peninsular campaign some of the War Office officials asked him what part of the soldier's outfit was most important in order to secure his efficiency? The Duke's reply was, "A pair of good boots." Being further questioned as to the part of the outfit next in importance, the reply was, "Another pair of good boots." There is more force and wisdom in the Duke's reply than appears at first sight; certain it is, those who have two pairs of good boots can always have one pair in reserve, getting dry and comfortable for a change when necessary. A man dry and comfortably shod is equal to more work in inclement weather, and less liable to be injuriously affected by exposure to cold and wet, than one suffering from cold, damp, or wet feet.

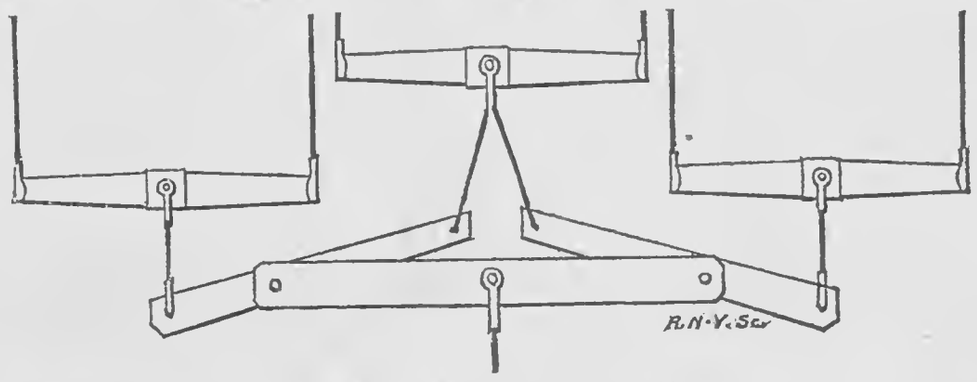
PARIS-GREEN ON CORN-STALKS.—Under date of Sept. 17, Mr. D. C. Spencer of Old Saybrook, wrote the Conn. Agricultural Experiment Station as follows: "Last Spring I applied Paris-green, mixed with water, to my corn when it was about three to five inches high, to stay the ravages of the Army-worm. I desire to know whether you have analyzed any corn thus treated, or can inform me if it will now be safe to feed the corn-stalks and husks? If not, will the Station analyze a sample for me?"

Mr. Spencer was requested to forward to the Station a dozen to fifteen stalks taken from different parts of the field. The samples came in good order, well tied up in papers and secured with sacking. The stalks were run through a straw cutter, and all the dust, together with a good portion of the well-mixed cuttings, was examined by Dr. Jenkins for arsenic. No trace of this poison could be found by the processes which serve to detect 1-50,000th of a grain of white arsenic. It thus appears that Paris-green applied to the young plants had been completely removed by the rain. It has been well established by Dr. McMurtrie that vegetation takes up into its interior no arsenic from the soil with which Paris-green has mingled in the quantities that are used for destroying insects, a result fully confirmed by this examination.

JOSEPH HARRIS, of Moreton Farm, is excellent authority as to vegetables as well as to farm matters in general. He has the following to say regarding beans, etc.:—

BUSH BEANS.—For early string beans, there is no better variety than the Early Valentine. Select warm, mellow, sandy soil. Sow the seed in drills fifteen inches apart, and drop the beans about an inch apart in the row. If the land is rich, thick sowing favors early ripening. It is quite an object to get string beans as early as possible, and it is well worth running a little risk of having the first sowing cut off or uninjured by a frosty night.

There is no healthier, more nutritious or more delicious and productive vegetable. It should be raised by every occupier of land. All that is required to have it in great abundance during the season, is good land, good seed and a little care in planting, training and cultivating. On his own farm he plants Lima beans in rows five feet apart, and the hills three feet apart in the rows. The land can hardly be too heavily manured. Plant the



THREE HORSES ABREAST.—FIG. 186.

beans with the eyes down, and put five or six beans in each hill, and cover with two or three inches of rich, mellow soil. The earlier the beans are planted after the soil can be made warm and mellow, the better. A little rich, well-rotted manure thoroughly worked into the soil in the hill will be of great benefit.

FOR BEETS the soil should be made rich and mellow. Rapid growth makes the beets tender. Drill in the seed pretty thick, dropping a seed every inch, and thin out the plants to three or four inches apart. The young plants that are drawn out can be used for greens. Keep the ground well cultivated or hoed, and suffer not a weed to grow. The farmer, at any rate, should have a full supply of beets, early and late. If he has more than he can use on the table, the cow or the pig will be grateful for them.

THE EARLY BASSANO is a standard early beet. If the seed is of a good strain and the plants are grown rapidly, the beets will be tender, sweet and of excellent flavor. It is doubtful if there is any better early variety. Sow the seed for an early crop as soon as the soil can be made warm and mellow. Do not cover more than an inch deep. For Autumn and Winter use, sow about the time field corn is planted.

MANGELS.—Mr. Harris prefers to grow the Yellow Globe Mangel, rather than the Mammoth Long Red. But much depends on the soil. On very deep, rich soil, perhaps a larger crop can be grown of the Mammoth Long Red than of the Yellow Globe. But the latter are better for shallow soils. They are more easily harvested, and are believed to give a richer color to the butter. The milch cows, as well as the ewes and lambs and suckling sows, will be very grateful for either variety.

Any one who can raise good beets in the garden, can raise good mangels in the field. The only difference is that we make the rows two and a half feet apart, and use the horse-hoe frequently between the rows. Thin out the plants to eight to fifteen inches apart. Keep clean, and this is all there is to be done. If there are any vacancies, fill out the spaces with Drumhead Cabbage. Sow the seed of the latter about a week or ten days later than the mangels. The cabbage will continue to grow and head after the mangels are removed. For a double crop of this kind, the land cannot be made too rich or be too well prepared.

Everywhere.

RURAL SPECIAL REPORTS.

CONN., Columbia, Tolland Co., March 18.—There has been considerable activity in the fruit market for a little time past, though at moderate prices. Apples have brought 35c. per bushel for medium quality. Potatoes bring 65c. for smooth Early Rose. Onions are not active. Farmers have been doing an unusual amount of business in getting off lumber at fair prices. It is probable that farmers will grow patches of sorghum the coming season sufficient for the production of all the syrup required in the family. There are frequent changes in real estate and some good farms for sale. The severe Winter will probably leave the roads in bad condition. The ensilage fever has not yet attacked this place. W. H. Y.

CAL., Marshall, Marin Co., March 10.—I am on a dairy ranche here where 200 cows are kept. This is the best time of the year for the business. Feed is good and abundant. We have not had cold weather enough to freeze a potato out-of-doors, and no frost at all except on a few nights. Butter brings from 36@37½ cents in San Francisco, 55 miles away; eggs, 20 cents—which is very low here—pork, on foot, 6 cents. We are making 140 pounds of butter a day, milking 148 cows. We have lots of flowers all the year round. W. H. P.

ILL., Kankakee, Kankakee Co., March 15.—We have had a long, cold Winter here. It froze up on the 15th of November and has not thawed out since that date. We have had 36 snows, with a total snow-fall of 64 inches. And up to the last week in February we had no wind; the snow lay just where it fell, making the sleighing splendid, of which we have had 12 weeks—something very unusual for this country. During 38 days the thermometer indicated zero and below. The fruit is mostly killed. Winter wheat and rye are doing well so far. Wheat is worth $1; corn, 35c; oats, 30c; potatoes, $1 per bushel; hay, timothy, $10 per ton; prairie $6, and other things in proportion. J. M.

IOWA, Lima, Fayette Co., March 17.—We have had some very cold weather this Winter. The thermometer was down to 30 deg. and 38 deg. below zero, and the snow about two feet deep. Crops of nearly all kinds were good the past season except wheat and potatoes. Corn is worth 22c. to 25c; wheat, from 60 to 90cts.; pork, $4 40 to 4 50; cream, 20cts an inch; butter, 18 to 20cts; eggs, 22cts; potatoes, 40cts. Spring wheat has been a failure for the last three years, some of the farmers have tried to raise Winter wheat, but it gets winter-killed. It averaged about five to ten bushels per acre. P. E. J.

IOWA, Greene, Butler Co., March 16.—We have had a very cold and severe Winter hitherto, with a greater depth of snow than Iowa's oldest inhabitant has ever seen in this State. A. M. G.

MO., Troy, Lincoln Co., March 17.—Wheat looks very promising. R. S. W.

NEBRASKA, Austin, Sherman Co., March 13.—Our Winter of 1880-81 commenced on September 13, '80. In 1879 the first frost visited us on October 19. The first snow fell on October 16, in '81, but this melted away. The snow from the first day of December is still on the field. What was melted by some sunny days in February last, came back by a heavy snow-storm on March 3. In 1880 every one was busy sowing wheat in the middle of March. Mine was sowed on the 24th. The ground this year is still frozen for many feet, and very few had their ground plowed in the Fall. There is, owing to the early Winter, a good deal of corn unhusked in the field. Our wells did not dry up, however. Some days I had to melt snow, because the well was filled up by a snowdrift; but my cattle did well. I lost only two calves, one owing to premature birth. I have plenty of hay. Last year I tried a few fruit trees, obtained from a New York nursery, and among twenty only three proved themselves not frost-proof with us. (Austin is 2 000 feet above the sea). I planted also 2,000 Osage Orange seedlings, but as far as I can judge from the few above the snow, they died. I add that the snow in the field is from 2½ to 2¾ feet high, and that perhaps the little specimens are saved by its depth. Our roads are so bad that two neighbors who had to go for coal, on different times, could not fetch more than 1200 pounds with four horses. Our mail ought to come three times a week; a good many times it could not come once in two weeks. J. B. N.

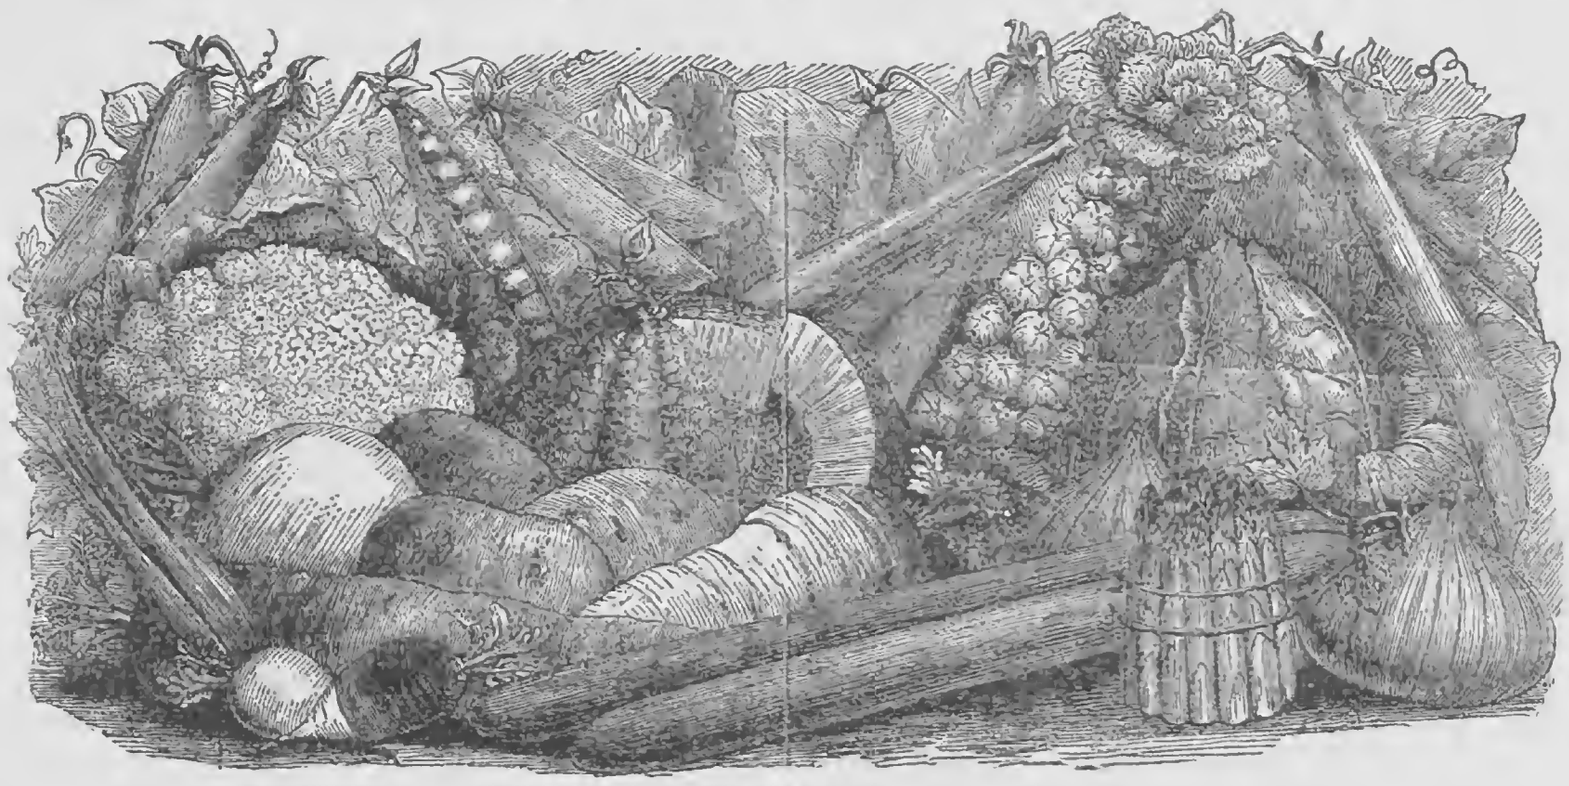
N. C., Tryon City, Polk Co., March 23.—It has been unusually cold here during the past Winter, and we have had two snow storms. Each time the snow fell to a depth of about four inches, and covered the ground for a week. No injury has been done to fruit trees or buds, however, and the prospect is now good for an excellent crop. A. B.

OHIO, Calcutta, Columbia Co., March 15.—The wheat came out from under the snow seemingly in fine condition. Weather fine, indicative of Spring. J. S.

S. C., Greenville C. H., Greenville Co., March 13.—Small fruit culture is going to be, in the not far distant future, one of the chief agricultural pursuits in this Piedmont Belt of South Carolina. A neighbor of mine made 550 gallons of wine last year from five acres of land, and it was from young vines. The same gentleman intends to put twice or thrice that number of acres in vineyards this year. Raising small fruits here can be done much more cheaply than in other parts of this State, on account of the adoption by our county of the "no fence" law, rendering it compulsory upon every person to keep his stock in a strongly inclosed piece of ground, and from trespassing upon the cultivated ground of his neighbor. It has been of immense pecuniary advantage to farmers by lessening the expense of fencing to at least one-fourth of its former cost, and owing to a gradual rise in the value of real estate also. One could have driven last Summer through Greenville County for four or five miles and not have seen one acre fenced in. Your correspondent, "Clinton," who wrote upon the destruction of our virgin forests, and the preventives of it, would surely have advocated the adoption by the farmers of the "no fence" law if he had seen it in operation here. A. H. D.

VA., Hayes's Store, Gloucester Co., March 15.—The farmers are very backward in their work this year because of the late, cold Spring. The greater part of the buds of the fruit trees are killed by the severity of the Winter. All Winter oats are entirely dead and everybody has lost nearly all of his root crops, vegetables, etc., by the severe freezing. Persons engaged in the oyster business have also been heavy losers, as the frozen rivers have made the oysters too poor to sell, which is quite a consideration in this vicinity where many people have to depend on that business for a living. But we are hoping to have good weather this year, so as to enable us to make up for our losses by putting in and making a large crop of corn, truck, etc. H. P. S.

VA., New Market, Shenandoah Co., March 15.—Farmers are plowing for corn and Spring crops; garden making is begun in earnest. We have had a very long and severe Winter here—the coldest known for many years. The thermometer has been as low 35 deg. below zero and the snow two feet deep. We have had but a few mild days during the whole Win-



A GROUP OF VEGETABLES.—AFTER DANIELS BROS'. (ENGLAND) GUIDE.—FIG. 187.

ter. Prices are as follows: wheat, 98c to $1.02; corn, 50c.; rye, 60c.; oats, 35c.; butter, 16 to 18c.; eggs, 12½c.; bacon, 8 to 11c.; potatoes, 50c. P. S. W.

WIS, Minnesota Junction, Dodge Co., March 13—We are having a large amount of snow this Winter. I have lived in this State for 40 years, and up to the present season have not seen so much snow or felt so many blizzards. We have been deprived of mails for a week at a time, and have only just got the roads cleared so that teams can travel. Just now a regular northeaster is coming on again. I think the Spring will open rather late, on account of the great body of snow on the ground. In the Fall, Winter wheat was small; but, as a general thing, it looks well, and I think will come out all right when the snow goes off. Stock looks well, but unless we have warmer weather soon fodder will be rather scarce. A great many farmers will plant Amber Cane seed in Spring. We think the RURAL Corn and Small Fruit Numbers just what we want. C. C. D.

WIS., Rice Lake, Barron Co., March 14.—This section is best adapted to the raising of small grain—wheat, oats and barley. Little corn is grown; a few farmers only raise some of the earliest sorts. Wheat averages from 15 to 30 bushels per acre; oats, 20 to 60; barley, 20 to 40. The last two years have been so dry that crops have only been medium. Fruit culture has not been developed here to any extent. Of apples a few varieties of so-called "ironclads" are raised. One gentleman however, is astonishing the neighbors by raising some of the standard sorts. W. T. F.

WIS., East Troy, Walworth Co., March 17.—We have had a long, cold Winter. It froze up the 11th of November and it only thawed one day in two months. The roads were as smooth as a plank road We have had plenty of snow since the 13th of January. On the 9th of February we had a big rain, then a heavy snow storm and wind drifted the snow badly. Wheat looked bad when the snow came, as it got a poor start last Fall H. A. T.

WIS., Lodi, Columbia Co., March 17.—We have had a long, cold and snowy Winter. Once the thermometer dived down to 40 deg. below zero. The roads have been blocked up so that it has been almost impossible to get around at all. B. M. S.

WIS., Kingston, Green Lake Co., March 16—We have had a very cold Winter with plenty of snow. For some parts of the time the roads were so badly blocked that whoever died could not be buried for days. P. B.

The Queries.

ANSWERS TO CORRESPONDENTS.

Soiling Milch Cows—All About It.

D. B., Omro, Wis., asks for the proper method of soiling milch cows, with all the usual details, so that a beginner can practice the system.

ANS.—Soiling is a method of feeding cattle that are confined in yards, pens or stables, with green fodder grown for the purpose and cut and carried to them. It is a practice suited best to lands that are of high value, and to small farms upon which pasturing cannot be made profitable. For instance, a farmer that has 50 acres of fair land would be doing well to keep 10 cows upon it under ordinary circumstances, but if by soiling his animals he can support 30, 40 or even 50 cows the advantages are very obvious; and this result has been reached by farmers who understand the system and know how to apply it economically. The method may be described as follows:—To begin, a green crop should be prepared for use early in the Summer, but a beginning may be made at any time. The system can, however, be better understood by going through the whole detail, supposing everything is in working order. The first crop prepared is winter rye or wheat or both, sown early in the Fall and later, so as to give a succession of crops for cutting. A piece of clover and grass is also kept in readiness and a field of Orchard Grass is useful. The rye or wheat is ready for cutting in April and May, and is cut and fed as it is required. One square rod will supply a cow for one day if the crop is good, as it ought to be. Near the end of May Orchard Grass and clover will be ready for cutting and Timothy and clover in June. Oats are to be sown on fall-plowed ground as early as possible in the Spring, one acre or more at a time in strips, so that the fodder will be fresh and tender. Oats and peas sown together yield twice as much as oats alone; barley and vetches also make a good crop as a change from oats. This lasts until early Canada corn, or early sweet corn becomes ready. This is ready as soon as it is in tassel, and lasts until the ears are hardening. If there is a market the ears can be sold for green corn; if not, they make rich fodder. Corn is sown in succession so as to keep coming in in the best condition.

When the first rye is cut off it will make a second growth and may be pastured if desired, but it is better to plow the land at once and plant corn or mangels, or oats and peas on it. The oat ground is plowed and planted as soon as an acre is cleared, and in this way the land is never idle but is always producing. Hungarian Grass or millet is sown in July on the late oats or the earliest corn ground, and these crops carry the cows through until the frosts make it necessary to cut the corn and millet. Rye may be sown in August for late pasture if needed, or for early cutting in the Spring, and also later. Whenever a new crop is ready, what is left of the former one is cut and cured for Winter feed, while it is in good condition and before it gets ripe and hard. An acre or two of mangels or sugar beets should be planted in May or early in June for Winter feeding with the surplus fodder or hay not used in the Summer. The corn is planted in drills from 18 inches apart for the small kinds, to three feet for the larger kinds, and the hills are made from six to twelve inches apart. Some bran and corn meal should be fed, as these make the manure rich and pay for themselves in the increased growth of the fodder crops.

The fodder is fed in racks in the yard or feed troughs in the stables, and all the manure is saved by using abundance of litter, such as dried swamp muck, leaves, hard-wood sawdust or even earth drawn in from the fields and scattered around liberally. An enormous quantity of the richest manure may be made by feeding liberally of such feeds as malt sprouts, bran, middlings, palm-meal, cotton-seed meal and corn meal; and the extra milk and butter pay for the feed. A cheap stable for 10 cows to be used for soiling may be made by setting posts in the ground 14 feet apart one way and seven feet apart the other way, and boarding up and dividing into stalls; two cows can be kept in each stall, fastening each to one side of the stall. The stalls are 9x7 feet and a feed passage runs in front from which the fodder can be given. The fodder is best cut 12 or 24 hours before feeding and it can be put into the feed passage through windows from the wagon so as to be readily distributed to the cows. Each cow will eat 50 pounds of green fodder, with an allowance of meal, or 80 pounds without, but the meal, if it has to be bought, is always advisable. The feeding should be in the morning right after milking, at noon and after milking at night. Abundant water also should be provided, as much as if the cows had dry food. The manure should be wheeled out twice a day and a deep gutter made to carry off the liquid into a hollow where it is absorbed by proper material of some kind. As soon as a piece of land is ready, the manure is spread, fresh as it may be, and plowed in, so that but little of it accumulates and none of it is wasted. The cows may be kept very clean if well littered, or the stable is well drained and cleaned twice daily and a brush and card should be used before milking. It is but little trouble and it pays both in the health of the cows and the cleanliness of the milk.

Inversion of the Womb in Cows, etc.

C. H. B., Hamett, Pa., says that one of his neighbors lately had a sick cow that was very weak, wouldn't eat, and was shivering all over; the tender-hearted owner gave her a big piece of pork; rubbed turpentine on her back and between the horns, and then, having cut open the end of her tail, put in some pepper and salt and tied a rag around the place, and our friend asks what we think of such treatment; but he says the cow did well after a day or two. 2. Another neighbor has just lost a cow owing to the so-called "calf bag" coming out after she had calved, and he asks a preventive or remedy for such mishaps, which are of quite frequent occurrence. 3. He also inquires how much a Cooley Creamer will hold; and, 4, what is our opinion of soiling cows.

ANS.—1. The treatment of your neighbor's cow was brutal, and not in accordance with the intelligence expected of a reader of the RURAL NEW-YORKER; but probably he doesn't read it. As the symptoms are not given sufficiently at length, we cannot prescribe the treatment that ought to have been employed. 2. Inversion of the womb is usually due to overstraining during parturition, irritation of the digestive organs, constipation, tumors in the womb passage, etc. Some cows have a natural predisposition towards it, owing either to a tendency to tubercnlosis or to their shape and make in the parts implicated. Elderly cows are more liable to the complaint than younger ones; and it has been noticed that those that suffer most from it rise considerably in the back, beginning to lower towards the tail, the hips, rump and sirloin being for the most part straight—a form that denotes great weakness in the special parts affected. If cows are kept in a cow-house before calving, the floor should not slope backward, but be level, or, better still in the case of some cows, slope as in the cut, figure 88, for some time before calving. The same beneficial influence would be exercised by raising the hind-quarters with a thick layer of litter. If falling of the "calf-bag" is anticipated, the cow should be carefully watched at the time of calving, and when the mishap takes place, a clean sheet should be placed under and around the "bag" to keep it from being soiled. If this has not been done, it should be thoroughly cleaned by the free use of warm water. The placenta should be gently removed and the bag returned as soon as possible. To effect this, the cow should be placed with the hind legs higher than the fore, as in the cut, a couple of assistants holding the bag at the level of the vagina by means of a cloth placed under it. The operator then, having well oiled his arm and hand, as well as the

FIG. 88.

surface of the womb, places his fist or half-closed hand against the center of the bag—the point farthest from the vagina—and presses it gently but steadily up the passage as far as possible, stopping when the animal strains and progressing between her throes. An assistant should afford aid by pressing the organ closely round the operator's arm, which should not be pulled out until the bag has been returned to its place and all the dependent parts pushed in with the left hand, which should also be well oiled. If the animal's throes are very violent, the following anti-spasmodic should be given: Chloride ether, 1 oz; laudanum, 2 oz.; ale (cold), 1 pint. The introduction of a ball of tow has been found beneficial in keeping the bag in its place; it should be removed after 24 hours, if the animal has become quiet. Harness, such as that shown in the cut, should also be employed until all danger of the bag falling a second time is over. It is well to restrain the bowels for a couple of days with doses of landanum. Animals that have died from this disease are unfit for human food. 3. The Cooley Creamers are made of a dozen sizes, with a capacity of from one cow to a large dairy. 4. This question is answered in reply to another inquirer elsewhere in this department of this issue.

Feeding Calves, etc.

A. H. C., Beatrice, Neb., is feeding five calves on the milk of two cows by feeding, with the milk, gruel made of equal parts of oil-cake meal and shorts, and he asks, 1, a number of queries as to the best method of feeding calves from one to three months old under the above condition, and what should be their ration of grain after they have been weaned of milk and put on grass when three months old; 2, a remedy for lice on stock; 3, how to grow large water-melons.

ANS.—1, Calves must be fed very carefully at such an early age. They cannot digest much meal and to over-feed them will stunt them in growth. The oil-cake meal and shorts should be boiled. If mixed in equal parts, one teacupful a day will be enough to begin with at a month old, and the allowance may be gradually increased until, when three months, a pint may be given to each calf. The meal should be well boiled, and made into thin gruel and added to the milk; raw meal will scour the young things. The feed should be given three times a day and about as warm as new milk. Some hay should be given—as much as they will eat; but the meal should never be left before them or they will eat too much. After three months they may have the raw meal, beginning a few days before with a small quantity and gradually increasing up to a teacupful at a meal, which is enough when on grass. Whole grain is not good for them; the extra cost of grinding the meal will be saved in the use of it. 2, Lice will come on any cattle under any circumstances, as these vermin are carried about by cats, dogs, rats and mice, fowls, owls, and other birds, and they come from unsuspected quarters often. When they appear use either the remedies lately mentioned in the RURAL, or apply a mixture of linseed oil and kerosene oil in equal parts to the top of the head, the ridge of the neck and the backbone, the brisket and under the thighs. A few applications will kill them off. Keep no fowls with the cattle or horses. 3, Large water-melons may be grown by pinching the ends of the shoots and keeping only one melon on the vine and feeding it plentifully with weak liquid manure. The soil should also be made rich and continually hoed and stirred.

Hoose in Cattle.

M. R. L. M., Fair Haven, Minn., asks for the cause of, and a remedy for, a disease that is proving fatal among his cattle. When lying down they can't get up, seeming to lose the use of their limbs which will not hold them up even when they have been raised. The appetite, however, continues excellent. On a post-mortem examination of one of twelve lost within three months, the lungs looked as if blood had settled in them, and on cutting them open the cells or "pipes" were found full of white worms from two to three and a half inches long, the size of No. 36 thread, and sharply pointed at both ends.

ANS.—This disease is known as verminous bronchitis or hoose, and is caused by the presence of the worms alluded to, in the bronchial tubes—the parasite is the Strongylus micrurus. The worm is taken into the body from the pastures or drinking places which are undoubtedly infested with it. As preventive measures—pasture on fresh land for two or three years and drain wet places in the pastures. Provide pure, uncontaminated water for drink and, if possible, give fodder that has grown on land to which sick cattle have not had access. Bury deeply the bodies of dead animals. As treatment, separate the sick from the well, give the former good, nutritious food to which is added one-half ounce, morning and night, of a powder made by mixing one part of copperas and two of gentian. Give plenty of salt, and fumigate by placing the animals in a close stable and burning flowers of sulphur as long as it can be breathed without producing violent coughing. The sulphur may be burnt by dropping a small quantity at a time on a shovel or pan of burning coals. Fumigations should be daily for three or four days, then weekly till cured.

Effects of Heat in Summer and Winter.

J. J. B., Allentown, Pa., asks why do we feel the heat more oppressive in July in the shade, where the thermometer registers 80 deg., than we do in January in a room in which the mercury rises to 80 deg.

ANS.—The bodily sensations of heat and cold are poor criterions by which to judge of the temperature, inasmuch as they often depend on conditions other than the degrees of heat indicated by the thermometer. Among other reasons why 80 deg. of temperature might be more oppressive in July than in January, the first that occur to us are, that the system is then more relaxed by a protracted heated term and therefore less able to endure a high temperature than in January, when it is braced up by the ordinary cold of the season; second, the air in hot Summer days is more heavily charged with malaria and other debilitating influences than in the cold days of Winter; third, a sensation is often pleasant for a short time which, if prolonged, would prove the reverse. It is related of Charles II., of England, that one day he asked a circle of courtiers and learned men why it happened that if a fish were carefully and slowly put into a vessel already filled with water, not a drop of water would overflow. Various reasons, foolish and philosophical, were given for the phenomenon, and when all seemed satisfied that the matter had been satisfactorily accounted for, the "Merry Monarch" exclaimed, with a laugh, "But the water *will* overflow." So, after giving the above reasons why a temperature of 80 deg. might prove more oppressive in the shade in July than in a room in January, it occurs to us to inquire—"But is it really more oppressive?"

Retention of Placenta, etc.

T. W. C., Big Rapids, Mich., asks what should be done when a cow retains the placenta after the second day.

ANS.—No harm usually results from the retention of the after-birth for a couple of days; but its removal should not be delayed beyond that time. To effect this, the hand and arm should be well lubricated with salad or linseed oil, and carefully passed up the vagina into the uterus, the points of the fingers having first been brought together so as to occupy as little space as possible, and the back of the hand being upwards on introduction. The protruding end of the placenta should be held in the left hand so that the operator can pull gently at proper times, and an assistant should hold the tail on one side. On entering the womb, the hand is passed to the several places where the after-birth is attached—the cotyledons, as they are called—and if these are gently pressed between the fingers with a kind of rotary motion, detachment soon takes place. Anything like violence must be avoided, or hemorrhage may result. When the entire placenta is removed, it would be well to syringe the vagina well with a quart of soft water containing one ounce of chloride of lime. The following drench may be beneficially given: Eight ounces of Epsom salts, half an ounce of ginger pulverized, one-quarter of an ounce of caraway seed pulverized, two drachms of copavia. If there are indications of bleeding give two ounces of ergot of rye powdered.

Palestine Mammoth Wheat.

E. S., West Union, N. Y., and several others, ask, 1, who sells the Golden Grain or Palestine Mammoth Wheat; is it a Spring or Winter sort, and its price; 2, have we catalogues of the Free Seed Distribution.

ANS.—1. It is offered in a dozen or more of the catalogues which we have noticed. The grain is very large and closely resembles the Black-bearded Centennial. It cannot be claimed to be the largest grain, since it is no larger than the Centennial. We have been unable to learn anything as to the *size* of the heads or the number of grains in a spikelet. J. J. H. Gregory, of Marblehead, Mass., offers this grain at 25 cents for a small packet. Other seedsmen offer it. Messrs. Haines & Co., who introduced this wheat, say it has proven a Winter wheat in Pennsylvania and a Spring wheat in the West and South. We should like to know what is meant by that. We believe that this grain will disappoint people or that it is the Black-bearded Centennial. We have a trial quantity and respectfully advise our friends to await further information before sowing it. 2. We have no catalogues. Our Seed Distribution was fully explained in our Fair Number Supplement, copies of which we send to applicants without charge.

Rice Corn.

F J. G., Dobb's Ferry, N. Y., asks for information about Rice Corn.

ANS.—There are a great many varieties of Sorghum vulgare, not one of which is everywhere known by the same familiar name. Thus we have Durra, Doubra, Rice Corn, Egyptian Corn, etc. Some of these bear upright heads of grain—others drooping, whence the botanical name of S. cernuum has been given. But it is now conceded that the drooping head is not sufficiently distinctive to justify the specific name. Nearly all of these varieties produce a single heavy stalk for which reason they are not prized as fodder plants. The grain is valuable as a chicken food and when ground makes a starchy flour less nutritious than wheat flour. We should not cultivate it if we could raise corn. The Rural Branching Sorghum is a variety of Sorghum vulgare throwing up many leafy stalks from a single seed. This also, unlike the single-stalked kinds, will bear cutting two or three times according to the length of the season. The stalks continue to grow just as well after as before cutting. "Rice Corn" seed may be obtained of any of our prominent seedsmen.

Moistening Old, Dry Cheese.

T. H. W., Oberlin, Ohio, having a few old, sharp, dry cheeses of good flavor, asks by what process can they be best preserved and rendered palatable.

ANSWER BY PROFESSOR L. B. ARNOLD.

Scanty moisture in cheese is a most favorable circumstance for long keeping. The cheeses described, being dry, are already in condition for preservation and will doubtless last as long as desired. The sharp flavor is also largely due to their being dry. It can be very much abated and the cheese made palatable and otherwise more desirable, by making them moist. This can best be done, after washing them with weak lye to get the grease out of the way, by keeping them wrapped in wet cloths. The absorption of water will be slow, but if persevered in it will be effectual. It can be facilitated by making small holes in the side and filling them with water. After cutting it may also be hastened by applying wet cloths to the cut surface. It will not do to immerse the cheese in water, either before or after cutting, as the water will dissolve out its goodness.

Miscellaneous.

E. A. F., Brighton O., asks, 1, whether Oxford Down Sheep are heavier-fleeced than Shropshire Downs; 2, is the market for pork likely to be high or low the coming season; 3, can different varieties of potatoes be planted close together without impairing the purity of the seed.

ANS.—1, Oxford Down sheep are long-wools, and Shropshire Down, medium-wools. The fleece of the former averages somewhat heavier than that of the latter. 2, In ordinary times, it would be very imprudent for any journal to predict, a considerable time ahead, what the price of hog products would be the coming season, as this is regulated not only by the relation of supply and demand, but often also by speculative movements, such as that which sent "mess pork" so extremely high a few months ago. Difficult as it would be at any time to forecast correctly the price of pork, to do so at present would be extra-hazardous owing to the uncertainty as yet with regard to the effects the present European scare about danger of trichinosis from the use of American pork, may have upon the trade. 3. Yes. They can only mix through the seed proper—"seed-balls" as they are called.

H. A. M., Wayne Co., N. Y., asks, 1, where can the Mapes Perfect Corn Manure be had, and its cost; 2, would it be advisable to use it on a clay soil; 3, how much should be applied per acre and how; 4, where can he get seed of the Golden Ovoid Mangel and at what price; 5. have the seeds of the Free Seed Distribution been sent out yet.

ANS.—These manures are advertised in our columns, to which we refer our friend for the address. The price is $50 per ton, or $5 00 per 200-pound bag. 2. We can not advise as to the use of special manures. The advice would be purely guess-work. 3, All the way from two to five hundred pounds. It is best to mix it thoroughly with soil—say three parts of soil to one of fertilizer, sow broadcast and harrow in. It may be used in the hills or drills also. 4. The Golden Ovoid was introduced by the RURAL NEW-YORKER in 1879. It is now offered in several of the catalogues we have lately noticed as "Yellow Ovoid" at 50c. per pound. 5, The columns of the RURAL will answer this question.

M. S. M., Norfolk, Va., has a cow about 18 months old, he thinks, that calved a couple of months ago. Her bag is very fleshy, but she gives little milk, and he asks, 1, whether there is any way to enlarge the udder. She is supposed to be a cross between Ayrshire and Jersey, and he inquires, 2, would the offspring of such a cross be hornless, as she is; she is a very large beast.

ANS.—1, Give plenty of good feed, air and exercise, and milk three times daily. Probably the yield of milk will be more satisfactory after the second calf. 2. The Ayrshire and Jersey are both horned and their offspring should therefore be horned too, unless dishorned artificially. From the fleshiness of the bag, the great size of the animal, and her horned head, we are persuaded that this beast cannot be a cross of the Ayrshire and Jersey. She may be a cross of one of the polled or hornless breeds, but, not knowing her color, it would be useless to conjecture which.

M. W. F., Bryn Mawr, Pa., asks how long the cyclamen remains in bloom.

ANS.—How long the cyclamen will remain in bloom depends upon the temperature in which it is grown. In a moderately low temperature we have had flowers remain in good condition for three months or more, about two months being a fair average. The duration of the bloom, as a rule, is shortened in proportion to the rise in the temperature. The cyclamen is not a hot-house plant. We agree with our correspondent, that the cyclamen is a beautiful as well as an interesting flower. We recently placed a bud of the beautiful Rose, Perle des Jardins, in water in a cold room. It preserved its freshness and beauty for a full month. This is a beautiful rose with large flowers of a golden yellow and high fragrance

T. Y. W., Cornwall-on-the-Hudson, N. Y., asks how to produce bottom heat on a small scale for a hot-bed, by the use of wood, coal or fluid.

ANS.—The above is so peculiarly worded that we scarcely guess what it means. Neither wood nor coal is used directly for bottom heat to a hot-bed. As to fluid, hot water (in pipes or a tank) is sometimes used, and there is nothing better, but it is not economical on a small scale. Manure is the material in common use, and it will yield a lasting heat if mixed with a goodly bulk of leaves. If our friend will tell us the extent of his proposed hot-beds, and for what purpose they are to be used, we can tell him whether hot water or manure will be the better for him, and how to employ them.

I. C. D., Valencia, Pa., has a two-year-old Jersey cow that has dropped her first calf. It has hair growing on its eye-balls just as on the rest of the body—one about half covered and the other about one-third; but it can see a little; the heifer yields milk on one side only, the other side of the udder never having enlarged or shown any appearance of containing milk, and our friend asks whether such mishaps are not rare, and what can be done to remedy them.

ANS.—Such cases are certainly rare. If the animals are thought worth it, the services of a veterinary surgeon should be employed. The cow's udder *may* turn out all right after her second calf. It might be as well to make beef of the one and veal of the other.

S. O. A., Allegan, Mich., asks, 1, whether Pearl Millet is good for Winter feed; 2, what kind of soil suits it best; 3, would it be advisable to raise it for fodder instead of corn; 4, how much seed would be needed for an acre and how should it be planted.

ANS,—1. It is not as good as corn-stalks. 2. With us it has done best on a clay soil, though it is supposed to do better on a sandy one; 3. No; we much prefer corn. 4. A quart is enough for an acre. Sow it in drills three feet apart and thin out in the drills to two feet apart.

P. D., Short Creek, W. Va., asks where and at what price can he obtain seed of the White Burley tobacco, and how to cultivate and cure it.

ANS.—Seed of the White Burley variety of tobacco can be procured of the Western Tobacco Journal, 140 West Front Street, Cincinnati, Ohio, or of J. T. Boggess, Felicity, Ohio. The seed is warranted fresh and true to name. Price 50 cents per ounce or $4 per pound. The method of culture and of curing seed leaf tobacco is applicable to the White Burley in the North, for which see articles in course of publication in the RURAL.

R. M., Mitchell, Ont., Canada, asks whether the Arbor-vitæ pyramidalis is as hardy as the Norway Spruce, and what nurseryman can supply plants 2½ feet high.

ANS.—The disposition of the American Arbor-vitæ to grow into a narrowly pyramidal form is seen in many seedlings. Some catalogues offer it as a distinct sort. There is no difference in hardiness between this and the less pyramidal kinds. We cannot say which is hardier, the American Arbor-vitæ or the Norway Spruce. Both are among the hardiest conifers known.

N. C. B., Clarksburg, W. Va, ask whether the Bowker Fertilizer Co, of this city is O K, and whether he would be likely to get as good a stand of grass by using its special grass fertilizer as by using guano.

ANS.—Yes, it is "O. K." Yes, we think you would. We believe that the fertilizer prepared for grass by this and other good fertilizing companies is better than guano, for the reason that the former contains the nutriment that grass requires in more nearly the right proportions.

J. C. T., Kendallville, Ind., asks, 1., the names of some histories suitable for children; 2, do we recommend the Compound Oxygen advertised in the RURAL.

ANS —1, Green's English History in short stories is an excellent work; histories of the series now being published, called the "Epoch Series" are also good. They can be obtained through the nearest book-store; 2, We have never tried the Compound Oxygen treatment; but we have heard of several cases in which its use produced good results.

J. G. A., Baltimore, Md., asks, 1, how to mix cement for making a walk; 2, a remedy for lice on a dog.

ANS.—One part of cement to three of coarse sand. It is best to dig out the paths first to a depth of a foot or more and fill in with broken or small stones. Then mix the cement so that it will run between the stones, finishing with that which is mixed with less water and a larger proportion of cement to sand. 2. Carbolic or tobacco soap. Whale-oil soap is good.

G. T. J., Goldsboro, N. C., asks, 1, what kind of fish will be suitable for a small garden pond 12 feet wide, 90 feet long and three feet deep; 2, where can the fish be got; 3, what books will "post" him on fish matters.

ANS.—1. European carp—Cyprinus carpio. 2. Of Professor Baird, Washington, D. C. 3. There is no book that treats fully of fish in a small compass. The reports of the U. S. Fish Commission are useful but voluminous.

S. A. B., Edwardsville, Ill., wishing to plant some shrubs, asks which would be the better soil for the purpose—one composed of sandy leaf mold and the natural black soil of the section from the foot of steep hills, or one of a rather grayish color mixed with leaves, but containing little sand, taken from the bed of a small lake that is usually dry in Summer.

ANS.—We should use only the soil which is described as "of sand, leaf-mold and black soil."

C. L. B., Wabash, Mich., asks where can the Niagara Grape be got.

ANS.—We do not understand that the grape is for sale, but responsible parties are wanted to plant vineyards of this grape, to whom special inducements will be given. That is, payment for the vines will be made contingent upon the production of fruit. The announcement will be found in our advertising columns.

J. S. W., Whitley, Ill., asks whether a cow that is milked slowly—say for 25 or 30 minutes—will give as much milk for as long a time as one that is milked more quickly.

ANS.—The milk should be drawn as quickly as possible. Such slow milking would soon dry up a cow.

J. H. F., Cobbleskill, N. Y., asks if Daniel Beatty is the manufacturer of organs and pianos advertised in the RURAL, and whether they are good instruments.

ANS —Yes. Yes.

J. B. N., Austin, Neb., asks whether the Albany and Hoosier grain drills sow garden seeds as well as plant corn.

ANS.—The first does. The latter is intended for corn or seeds as large as corn.

THE COMING STRAWBERRY

BIDWELL. The Genuine *Headquarter Stock.* Having secured from the originator all of his stock and also from Mr. T. T. Lyon, Pres't Mich. Pom. Society, and disseminator of the Bidwell, all the stock owned and controlled by him, I am able to supply this most promising of the new strawberries in limited quantities. The First Premium was awarded to the Bidwell as the "Best New Variety and Plant," by the N. Y. Hort. Society in 1880. Also a superb stock of the celebrated.

CUTHBERT RASPBERRY.

An exceedingly liberal offer of these two fine fruits, with my book "Success with Small Fruits." Descriptive Catalogue free. Address

E. P. ROE,
Cornwall-on-Hudson, N. Y.

OATS RUSSIAN WHITE. Best in cultivation. 100 bushels an acre. Rust-proof and hardy. 1 lb., mail, postpaid, 50c.; 3 lb., mail, postpaid, $1.00; ½ bush. by freight or express, $1.50; 1 bush. by freight or express, $2.50. New bags, 25c. each, extra. Address, D. M. FERRY & CO., Detroit, Mich.

RAISIN GRAPE VINES

By mail, BEST, 35c. each; 3 for $1. Cuttings, warranted to grow, 10c. each. W. A. SANDERS
Sanders, Fresno Co., California.

MANGEL, CARROT AND TURNIP SEED.

Yellow Globe, Giant Red, etc., 40c per lb. Ask for Catalogue. Stamp required for Sample Packet of Vegetable or Flower Seed.

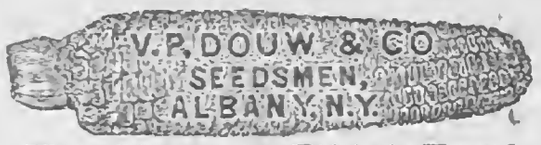
PRICE & KNICKERBOCKER,
SUCCESSORS TO



We celebrate our Fiftieth Year by publishing a more complete Catalogue than ever before. 72 pages, profusely illustrated. Sent free by mail.
PRICE & KNICKERBOCKER,
80 State St., Albany, N. Y.

800,000 No. 1 PEACH TREES.

Over eighty varieties. Among which can be found kinds suited to all sections, including all the new and old standard sorts. Also 200,000 Apple Trees. 200,000 of them extra long-keeping varieties, adapted to Southern planting or wherever long-keeping apples are desirable. I also offer a full line of all kinds of Nursery stock, at prices to suit the times. Apples and Peach Trees, Grapevines, Raspberries, Blackberries, Strawberries, Roses, Shrubbery and Hothouse plants sent by mail to all sections. Catalogues showing how and what to plant, with much valuable information, mailed *gratis* to all applicants. RANDOLPH PETERS, Great Northern and Southern Nursery, Wilmington, Del.

TREES FRUIT and ORNAMENTAL.

One of the largest and most complete assortments of any size desired. Also, Flowering Shrubs, Grape Vines, and Small Fruits.

THE NEW GRAPES.

Lady, Brighton, Jefferson, Lady Washington, Moore's Early, Duchess, Purity, Prentiss, Highland, Nosh and El Dorado. Also Concord, Rogers's best Hybrids, and other older varieties of merit. Splendid 1 and 2 years Delaware layers, $8 to $12 per 100, $60 to $100 per 1,000. Fine foreign grapes, including Welcome, for vineries. Cuthbert, Gregg, and Mammoth Cluster Raspberries. Glendale and Sharpless Strawberries. Magnificent ever-blooming Roses, by mail, $1 per dozen; by express, $6 per 100, $50 per 1,000. Three strong 2 years, or four 1 year Lady or Brighton, post-paid, for $1. Circulars free
GEO. W. CAMPBELL
DELAWARE, OHIO.

CHOICE PLANTS AT LOW PRICES

These collections (Strawberries excepted), *packed to carry safely a thirty days' journey* if the order is sent early. I prepay mail packages; purchasers pay express charges. At these prices no alterations made. Shall be pleased to *double* but can not *divide* a collection.

GRAPES—
1 Prentiss, $1.50. 1 Brighton, 30c.
1 Moore's Early, 60c. 1 Lady, 40c.
By mail, $2.50; by express, $2.25.

STRAWBERRIES—
12 Kirkwood, 12 Marvin, 12 Longfellow, 12 Warren, 12 Brilliant, 12 Glendale, 12 Sharpless, 12 Duchess, 12 C. Downing, 12 Cumberland Triumph, and 2 of the Bidwell. Order early. The supply of Bidwell is limited. By mail, $4.00. By express, $3.00.

RASPBERRIES—
10 Highland Hardy (earliest), 10 Brandywine (later), 10 Franconia (later), 10 Cuthbert (latest).
By mail, $1.50. By express, $1.00.

A RARE OFFER—
1 Hydrangea Paniculata. 1 Viburnum Plicatum.
5 Roses (H. P. one year old plants, choice varieties, my selection),
4 Grapes (Prentiss, Moore's Early, Brighton, Lady,)
30 Raspberries, including 10 Cuthbert, 10 Gregg,
12 Blackberries (Snyder and Kittatiny),
6 Currants (Red and White),
100 Choice Strawberries, (my selection of varieties).
By express only for $5.00.

Descriptive Catalogue free. Strawberry Culture for 1c. *stamp.*

ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, APRIL 2, 1881.

We have greatly desired ere now to place before our readers the truth, in so far as it can be told, regarding the ensilage question—that is the value of pits or silos for preserving corn-stalks, etc. in a succulent, green condition. A good deal of what has been printed on this subject has been written by those who are in one way or another interested in exaggerating the advantages of the system. At our request Professor E. W. Stewart has furnished us with the whole story as he views it—the first part of which is presented this week. We have only to add that his views are entitled to much respect, as he has investigated the matter very thoroughly; neither has he any motive in distorting the truth, nor is he capable of so doing if he had.

Clethra alnifolia—sometimes called White Alder and Pepperbush—is found wild in damp woods, from Maine southward near the coast. It bears pretty racemes of heath-like white flowers in July and August, and is well worth a place in every garden. Besides its beauty as an ornamental shrub, attention is called to it as a forage for the honey bee, blooming as it does when few honey-yielding flowers are in bloom. The honey from this plant is said to be nearly white and of the best flavor. It is easily transplanted at almost every season and thrives in dry as well as in wet places. We have cultivated the plant for years.

Corn.—The final estimate of the corn crop for 1880 in all the States is placed by the Agricultural Department at 1,507,530,040 bushels. Excellent unofficial estimates put it at 1,537,535,940, or about 30,000,000 bushels more. While the aggregate yield of the Western States, according to the latter calculation, is considered to have been 77,147,710 bushels less in 1880 than in 1879; that of the Middle and Southern States is thought to have been respectively 27,720,040 and 40,380,620 greater. Thus the total shortage in 1880 from the yield of 1879, would be less than 10,000,000 bushels according to good unofficial estimates and about 40,000,000 bushels according to the Department of Agriculture—closely confirming our prediction in the Rural of last September 4th. At present it is highly probable that the supply of corn for the remainder of the year will be unusually small; for, in addition to the fact that the demand for it both at home and abroad yearly increases while the supply this year was originally less than last, a considerable amount of the crop, especially in the Northwest, was left in the fields last Fall, owing to the early arrival of severe weather, and much of this the storms have beaten down into the mud where it has become frozen, so as to render it unmerchantable. Vast quantities, too, have been used for fuel, especially in Iowa, and the other Northwestern States, while owing to the unusual severity of the Winter and the shortage of hay in many sections, a greater than ordinary amount has been used as stock feed. Of course, there will still be a vast quantity of corn in the country, yet the supply will be moderate in comparison with that for the last few years.

THE VALUE OF ENSILAGE.

An esteemed correspondent writes us as follows respecting ensilage:

"No doubt Professor Johnson is correct when he says that if corn were cut at the same time and properly cured, it would be just as valuable, for it is seldom properly cured and the labor of so curing it is greater than of preserving it in silos. Besides, the system of ensilage is very much broader than merely preserving green corn. It certainly appears to be appropriate for preserving all the grasses and for rendering soiling a practical system, which it never has been for the general farmer. It is unfortunate that its enthusiastic advocates have confined it to the one partial food of green corn. By applying it to the various grasses, a complete ration for milk or fattening may be fed from the silo, Winter and Summer. This will solve Winter dairying and render the farmer independent of purchased grain. The whole system is not understood even by its advocates. The wings of some of the enthusiasts of the system, who figure out impossible profits should be clipped; but there is much to be said in its favor after all the drawbacks are considered?"

A MISLEADING DEFINITION.

In the new Supplement to Worcester's Dictionary we notice that the word Ensilage is defined as follows:—"A mode of preserving vegetables fresh, as green corn fodder, sugar-cane, and other arundinaceous plants, by burying them in the earth in a silo or trench." Now in point of fact ensilage does not and cannot preserve vegetables *fresh*. We are told in this very dictionary that the proper use of the word fresh is as in the terms "fresh news" and "fresh vegetables," and why in the world is so much stress laid on "arundinaceous plants"? On turning to the body of the work we find that the word arundinaceous means "of, or like, reeds." But the method of ensilage has for many years been practised for preserving clover, lucerne, the tops of root crops, chicory leaves, mashed roots, brewers' grains and in general all sorts of forage that cannot readily be dried, no matter whether the plants be graminaceous, leguminous, chenopodiaceous, or what not; in view of which fact, the limitation of the lexicographer is somewhat amusing. If the intention had been to imply that thus far ensilage has been commonly applied to the preservation of fodder corn in this country, assuredly something would have been said of plank and stone coverings, as well as of earth; and of *structures* above ground and underground. It was well enough perhaps to grant, unreservedly, papers of naturalization to this French word and to direct, as has been done, that it should be pronounced as if it were of English invention; but it would certainly have been better for the permanent credit of the dictionary if the meaning of the word had been less incorrectly defined. The dictionary-maker, of all persons, should never do work in a hurry. He should most carefully guard himself, withal, from the delusion that pedantry can by any possibility take the place of precision.

CROP PROSPECTS IN THE WEST.

A few of our contemporaries in different parts of the land have already, in answer to inquiries, received a large number of reports from various parts of the country with regard to the condition of the fall-sown grain. The Cincinnati Price Current published last week reports from 400 different points chiefly in the West and Northwest, and on March 26, Bradstreet published reports from 18 cities in the same region, the senders having beforehand gathered telegraphic information from various trustworthy parties in the tributary territories. Inasmuch as most of the country covered by the inquiries is still covered also by snow, very little definite information has been obtained. Comparing both the above reports with some others of a local character, it appears that in Ohio the prospect for wheat was fair with no increase of acreage from the previous season. In the Northern part of the State the outlook for oats was poor; as was that for barley in the Southern part. In Indiana, the outlook for wheat was less favorable than last year; the acreage about the same. In Illinois favorable reports predominate with regard to wheat; there has been an increase of acreage under it, and the aggregate yield is expected to equal that of last year. In Missouri and Kansas, the outlook for crops is highly promising, and there is a considerable increase of acreage under wheat. In both States the severe Winter has left the ground in better condition than usual for Spring work. In Texas, Arkansas and Southern Missouri plowing is now going on, and in the two former States there will be a considerably larger acreage under cotton. In Michigan, much uncertainty prevails with regard to wheat, but the general impression is that while the acreage is about the same the yield will be less than last year. There will be little plowing before April 20. From two to four feet of snow cover the crops in Wisconsin, but the prospect for wheat is unusually good. Montana farmers are reported to have begun seeding a week ago, and Dakota farmers will begin in about two weeks—April 9th. The Missouri River is breaking up, and an immense wheat crop is expected on the "Bonanza" farms. In Southern Minnesota there will be a large increase of acreage under crops; but seeding will not begin for three weeks. The prospects for wheat in Kentucky are less, and those in Tennessee more, favorable than at this time last year. None of the reports indicate any aggregate increase of wheat acreage; but the Department of Agriculture estimates that this amounts to four per cent. on last year's area.

SHOULD THE INNOCENT SUFFER?

A little over a week ago some of the leading members of a gang of land swindlers were arrested in St. Louis, Cleveland and Pittsburg, and a number of others are still at large in other places. Their operations are said to cover from one to three million acres in Missouri and to have been carried on since 1854. The ring engaged in the fraud is believed to have included several government officials, one of whom used to be in charge of a Missouri land office, by which means the swindlers obtained possession of a large quantity of genuine United States land patents, which were sold to innocent settlers accompanied by forged deeds that pretended to give complete titles to the property. These deeds were often given the appearance of age so deftly by the use of smoke or coffee, that no one ever suspected the deception until about 14 months ago, when a private letter gave an inkling of the matter to Secretary Schurz. Special Treasury agents have been investigating the swindle ever since with the results of the above arrests. That this swindle should have been aided at the outset, if not started, by government officials, and that it should have remained undetected for 35 or 36 years, argues gross carelessness—to put it mildly—on the part of the responsible officers of the government. In the meanwhile thousands of innocent settlers have invested their money and labor in lands to which they have no legal title, and the question arises—what should be the action of the Government under the circumstances? In view of the fact that the swindle was perpetrated through the dishonesty of the Government's own officials; that it flourished for upwards of a generation through the gross carelessness of successive incumbents of government offices, and that the present occupiers of the land, having paid for it in good faith, were swindled through the Government's own fault, we believe that only one upright course now lies open to it—to punish the swindlers as severely as the law allows, and to give clear titles to their holdings to the present occupiers of the land. While we insist on the punishment of the guilty, we are equally emphatic in our opinion that for their crimes the innocent should not be made to suffer.

CULTURE ON THE FARM.

Agri-culture, horti-culture, flori-culture are the kinds of culture we keep most before our readers, and we feel at times guilty for leaving it to so great an extent to others to talk of homo-culture, or the culture of man. For, after all, what is everything and anything without Man, the thinker, Man, the worker.

To be sure, we have not failed to urge the proper education of the young; but we have not done what we should to persuade the elder people not to neglect that cultivation of the mind which is necessary to enable them to keep pace with the progress in every department of this great world in which we live. The boy who leaves the school-house early in life, and takes up farming as his avocation, should no more think of neglecting his study and reading than should a physician on the receipt of his diploma from the medical college that graduated him. But we are sorry to say it is often done.

A case in point: The writer being in want of some information concerning matters of long ago, of which he supposed an old school-mate was possessed, wrote him a letter asking a few simple questions, to which no reply came. The matter was not of sufficient importance to warrant another request in the face of such apparent neglect. A year after the parties met in their native country village, when an apology and explanation were offered thus: "I received your letter; but I don't write letters any more. I have got out of the habit of it, and I always get my neighbor to write for me. I told him what to write, but I guess he didn't do it."

Now this man in his youth was equal to the average of his mates as a scholar, and could have been, if he would, the equal in intelligence and information of most of those about him. But what kind of a farmer has he made? The same as his father before him. He is honest, industrious and frugal and his farm is well kept, after the same plan as a hundred years ago. There is no "book farming" about him, you may be sure.

We cite this man as an illustration. The country is full of such, and it ought not to be so. But how is the evil to be remedied? By the introduction in every village and hamlet of Farmers' Clubs, that shall be debating societies, taking up as questions matters both on the farm and off it; of circulating libraries, from which books may be taken at small annual expense, that treat chiefly but clearly on all subjects of interest; of newspapers and magazines that shall be read and talked about, and by bringing forward anything and everything that shall keep alive and in action the thinking power. Interest the young men and the young women in these things, and as they grow older let not the interest flag; and the next generation of farmers and farmers' wives will be wiser, better and happier than the present one.

BREVITIES.

Our choice of green peas for family use from careful tests of *all* the leading varieties is for earliest Alpha; for next early McLean's Little Gem; for the main and late crop two sowings of Champion of England.

Mr. Charles Downing writes us, and our readers will please make a note of it, that "apples sent to be named, should be of average size, color, form, etc., such as will give a fair representation of the variety."

Proctor Knott, Congressman from Ky., in a late House debate on the proposal to grant $10,000 for further investigation of the ways of the cotton-worm, estimated the comparative value of turkeys and government bugologists thusly:—"There would be more propriety in an amendment voting $10,000 to buy turkeys to catch the tobacco worms in my district, for I am sure a single turkey cock is worth more in the extermination of insects noxious to agriculture than all the entomologists the government has employed in the last ten years." Wonder whether it was this curious comparison of the irreverent Knott that caused the defeat of the proposed appropriation!

A bill is now before the Committee on Agriculture of the Massachusetts Legislature the decision with regard to which is of interest to our agricultural colleges in so far as a precedent may be established in a matter which should closely affect the interests of these institutions. It is proposed with regard to the agricultural college at Amherst, to adopt the policy now common in nearly all the New England colleges, by giving its alumni a share in its government instead of the self-perpetuating Board of Trustees who have now control of the institution. Should the bill be passed 15 members outside of the ex-officio trustees are to be chosen for five years—one-third by the Board itself, one-third by the State Board of Agriculture and one-third by the graduates.

The fourth Fat Stock Show at Chicago will open to the public on Monday, November 7th, next, and continue open daily until 10 P.M. the following Saturday. There will be practically no changes in the regulations that have been in force at former exhibitions. The premiums already decided on amount to $4,675 against $3,455 last year. For cattle the premiums will aggregate $2,775; for sheep, $920; for swine, $795; for poultry, $190. A considerable sum is also expected to be offered as special premiums by private individuals, one gentleman having already promised $700 for that purpose. In a Fat Stock show horses, of course, have no legitimate place; but as the majority of visitors are interested in fine horses as much as in other kinds of farm stock, the State Board of Agriculture has decided to partially open the doors of the exhibition to breeders and importers of horses. Of course, no premium will be offered in the equine department, but the excellent opportunity there afforded for the display and sale of choice stock will doubtless induce owners to make a fine show, as each horsemen will have the privilege of exhibiting any number of horses up to ten.

Reports from Southern Texas and the Gulf indicate a rapid breaking up of the Northern Winter. The sun having in his course northward passed the equator on March 20th, the warm winds from the Gulf are already preceding him northward. Late telegraphic reports to New York City say that the season in Texas, Arkansas and Southern Missouri is no later than the average, and although in Northern and Western Kansas, Northern Missouri, Southern Iowa and Southern Illinois telegrams say the season is a week or two later, the prospects are fair for a rapid advance of Spring. In the Northwest, however, Winter still appears reluctant to depart, for on Friday, March 25, the Signal Service telegraphed to this city that for the previous five days the temperatures had averaged below the freezing point as follows:—Dakota seven degrees; Minnesota, nine; Wisconsin, six; Michigan, ten; Iowa, five; Nebraska, three; Illinois and Missouri, one, with Kansas at freezing point. The condition in the last five States was favorable to the rapid disappearance of snow. This morning's telegrams announce disastrous floods with great destruction of property in Nebraska, and should the enormous deposits of snow melt rapidly, similar floods must occur all over the West. Farmers should prepare, as well as they can, in advance for such a contingency.

Literary Miscellany.

A WONDERFUL CRYSTAL WEDDING.

JOSEPHINE POLLARD.

"'Tis time for our crystal wedding,"
Said Mr. Frost to his wife,
With a suddenly sharp expression,
That cut like a two-edged knife.
"The North Wind must be invited
To bring his friend from the East,
And none of our friends must be slighted
Or fail to appear at the feast."

So then they began to make ready
With speed, regardless of cost,
For the beautiful crystal wedding
Of Mr. and Mrs. Frost.
The North and the East Wind called for
Miss Snow and old Mister Sleet,
And all of that party together
Were sure to have things complete.

In honor of the occasion,
The houses with fringe they drape,
Rich beads and bugles of crystal
Suspended in every shape.
While all the poles and the chimneys
Were dressed in transparent suits,
And the trees were overloaded
With loveliest glaced fruits.

The Telegraphs were invited,
So out of town couldn't go;
And the Telephones failed to answer
When any one cried "Hallo!"
The magnates were not forgotten,
Who stand in serene repose,
And Franklin made his appearance,
With an icicle on his nose.

There were acres on acres of icing,
And wonderful rivers and lakes;
Most beautiful caves and grottoes,
And delicate frosted cakes;
While cobweb curtains suspended
Above the scene, in mid-air,
Lent a charm to the crystal wedding,
That proved such a grand affair.

Decanters and tumblers, engraven
With initials of old Jack Frost,
Were scattered about in profusion—
No telling just what they cost;
And I couldn't begin to number
How many from out of town
Came in to this crystal wedding,
And at the banquet sat down.

Old Sol got wind of the matter
Just as he was going to bed,
And out from between the curtains
He suddenly popped his head
And smiled, as with glowing fingers
He took Jack Frost by the ears,
And loosened the pearls and diamonds,
That straightway dissolved in tears.

Soon faded the lovely picture,
The limpid and sparkling sheen,
That seemed, to our raptured vision,
Like unto a fairy scene;
And some will remember the beauty,
And some will remember the cost,
Of the wonderful crystal wedding
Of Mr. and Mrs. Frost.—N. Y. Independent.

ADVENTURES OF AN ANTEDILUVIAN
In The Land of Promise.

BY JAMES M'NEILL.

(Continued from page 213.)

CHAPTER X.

SOCIETY WITHOUT SOCIAL DISTINCTIONS.

SHORTLY after seven o'clock Mr. Flyter arrived and we set out together for the neighboring park. We found it already lighted for the evenings entertainment. Many people had arrived, and the children especially were present in full number, which seemed to imply that it was an occasion in which they greatly delighted.

All the people seemed to meet on complete equality, and no one passed another by without a pleasant greeting. There were no bashful ones sitting apart from the rest of the company as though fearful of exciting unfavorable remarks on their dress or behavior, nor could I discover that any one was inclined to put himself or herself forward with the view of attracting attention.

The old people walked and talked together through the delightful avenues of the park, or sat in the pleasant arbors and discussed the events of the day. The young people danced and sang, played at various games, and created fun and enjoyment for themselves in a thousand different ways. While the children collected together in a pavilion by themselves, passed the time as gleesome, happy children do.

I moved among them quietly, and would modestly have kept myself in the back ground. But this I was not permitted to do. Mr. Flyter introduced me to every one he met, and they all seemed so cordial and pleasant, and treated with so much respect and courtesy that I was made to feel at home in spite of myself. In fact I was treated in every respect like one of the family, a word in which I found they much delighted, as expressing the intimacy, and friendly relations which existed among the people of each section of the city. Indeed, I had never known a family among whose members there was greater harmony of feeling, more delicate regard for each other's rights and preferences, or a stronger disposition to repress selfishness; and to promote each others happiness in every reasonable manner.

I asked Mr. Flyter if it was the custom for all the people of the wards to assemble at these social gatherings.

He replied, that on an average there would not be forty of the inhabitants of each ward absent. And these would be away visiting, or detained at home by natural and unavoidable causes. "We are a very social people, as you may have observed," he went on, "and these gatherings are sustained in so general a manner, not from a sense of duty, or out of respect for an old custom which has been handed down to us from our fathers, but because of the real enjoyment which we derive from them:

"Do you keep them up the year round?" I asked.

"Yes, sir, Sundays excepted, every night throughout the year, and even then all the people may be found congregated in the church at the other end of the park."

"There is one thing about your people," said I, "which I cannot understand, and that is, how you get along without a lower stratum of society. I walked eight miles through your city this morning, and I did not see a single home of poverty, and among the many persons whom I met not one presented the appearance of want. You say that all the people of your ward are assembled here to night with the exception of perhaps forty, yet I cannot discover that any one is distinguished from another by dress, intelligence of look, or general manners."

"I do not quite understand your question, sir," said he. "What do you mean by a lower stratum of society?"

"Who, are your 'hewers of wood, and drawers of water.' The men and women of toil; who carry society along on their brawny shoulders, and who by the sweat of their brows and the toil of their hands make smooth the way of their more fortunate fellows?"

"Your explanation only mystifies me, sir. 'Men and women of toil, who by the sweat of their brows and the toil of their hands make smooth the way of their more fortunate fellows!' Why, sir, I know nothing in the whole length and breadth of our land which answers this description."

"Perhaps I obscure my meaning by too figurative language," said I, "let me speak more plainly. This magnificent city of yours did not spring up by magic. Brains of skill and taste are evident in it everywhere; but back of these there must have been the muscle of the laborer to dig its foundations, delve out its sewers, pave its streets, and rear its wondrous structures. The food which comes nicely served to your table is not the product of unaided nature, there must be hands to guide the plow, to sow the seed, to cultivate the crop, to reap the harvest, to thresh it, grind it, and transport it to where it may minister to your imperative wants. Now in my country the men and women who thus serve society by the labor of their hands constitute a distinct class and in the social scale, stand at the bottom, and are hence said to be the lower stratum of society."

"You surely do not mean to imply by your remarks," said he, "that in your country there are two classes of society; one of which performs all the labor, and the other of which eats the fruit of that labor; that those who labor are looked down upon and despised by the other class whose imperative needs they are the direct means of supplying?"

"Not exactly, sir," said I, "willing to round off the sharp edges of this rather severe view; You know that in the very constitution of nature there is a foundation for different ranks of society. All men are not created with equal gifts. Some are born to command, and others to obey, some to lead, and others to follow, some to plan, and others to execute. All cannot command, for then there would be none to obey; neither can all lead, for then there would be none to follow. There must be many followers for one leader, and many to execute where there is one to plan, and as the necessities of existence are alike upon all, the inferior offices in the ongoings of society naturally fall to the lot of those whose birth or circumstances do not raise them above the necessity of performing them."

"Hence you mean me to understand," said my interlocutor, "that in your country, inferior offices, as you term them, in the maintenance of existence, all fall to the lot of a class, which you call the lower stratum of society. Now, in this country no duty which is connected with the maintenance of existence is regarded as inferior. It would be a libel on the goodness of the Creator to suppose that he should have constituted our bodies in such a manner that anything connected with the maintenance of their integrity should be degrading to perform. The fact that man needs food which can be produced only by muscular effort necessary to obtain it, or that he needs clothing to ward off the cold, or a house to protect him from the inclemency of the weather, which cannot be secured to him without labor, indicates that it would be to his advantage, and in no sense degrading, to put forth the labor essential to accomplish these necessary results.

"Now for one part of society to impose on another part the labor necessary to provide for our natural wants, and to look down upon it because it is less fortunate in its worldly circumstances, would be utterly abhorrent to our reason, our sense of justice, and the charity which we are taught to exercise toward our fellows. With us a man is esteemed according to the usefulness of the service which he performs. The man who digs a ditch to drain a marsh which is the source of malaria to the inhabitants round about it, is more honored on account of that service than the philosopher, who, after years of study, arrives at a demonstration of the revolution of some nebulæ in the realms of space. In fact, it is recorded that several generations ago, a poor man took possession of a tract of unreclaimed land which had hitherto been avoided on account of the expense of draining it. He and his family suffered much from the noxious exhalations of the marshy soil; the circumstances of the case becoming known here, a body of our best citizens went out, and getting the poor man away from home, with their own hands dug ditches, and completely drained the marsh before his return, and escorted through the streets by thousands of our citizens as a mark of the esteem in which such a generous deed was held."

"Such a disposition of good-will toward our fellows in a people," said I, "cannot be too strongly commended, or its far-reaching, beneficial influences too highly rated. But it seems to me that in your remarks you have not given due weight to the advantages of the natural division of labor which obtains in every community, nor to the fact that men are naturally adapted to different occupations by their difference in mental endowment, nor to the fact that rank in society is a natural outgrowth of this very difference in mental capacity which is a characteristic of society everywhere.

"You are a manufacturer and merchant. Your time and attention are almost completely taken up with your business. If you have a house to build, you have not the time, the physical power nor the skill to dig its cellar, lay its foundations and put together its materials. But each of the many branches of labor connected with it is best performed by the different tradesmen, who are each trained to a particular calling.

"The trade or profession which an individual is capable of following with success depends much on his natural mental endowment. There are few poets, statesmen, or philosophers in any generation. Those who have not the talents for these exalted stations must content themselves in the broader fields of the professions. If they have not the talents necessary to earn a livelihood here, they must fall back into the still broader fields of the trades and mercantile life. And if in these fields they have not sufficient intelligence to earn success, they must descend to that lowest and broadest of all conditions in society, the condition of the common laborer.

"I begin to suspect," said Mr. Flyter, "that the difference in our views of this subject results from the difference in the standpoints from which we contemplate the picture. You, knowing but little of the condition of society here; argue from the facts which you have observed among your own people, and I, knowing nothing of the manners and customs of your people, speak from my knowledge of society as it exists among us.

"I confess that I can gather but a vague notion of your meaning when you speak of different grades in society, but I recognize the justness of your observations on the social inequality which exists between the cultured and refined and those whose minds have been dwarfed, and whose perceptions have been blunted by inactivity, and the continual strain of physical labor. Happily, however, among us there is no such social inequality. Here every individual is well educated and cultured. The waiter who serves you at your hotel, the barber who shaves you, and the laundryman who does up your linen—have had just as much care bestowed upon their education, and are as well informed and as well bred as any member of our general society. As I have said before, usefulness is the badge of esteem among our people. And all being alike well-educated in their youth, and allowed the same number of hours each day, and the same opportunities, speaking generally, for the cultivation of their minds and the development of the noblest attributes of our nature, there is, of course, not the least occasion for distinctions in our general society."

Our conversation was interrupted at this juncture by the approach of a young lady, the most lovely in feature and the noblest and most graceful in mien that I had ever seen, who addressed Mr. Flyter as Grand-pa—being in reality his great-grand child. The old gentleman cruelly turned me over to her tender mercies, which was an infliction I felt sure his kind nature would never have been guilty of, if he had really understood my feelings in the matter. For though an ardent admirer of the opposite sex, I had always enjoyed them best at a distance. And to be obliged to keep up a conversation with this divine creature, who I felt sure must be the belle of the park, and who I could not but believe must regard me as the most ugly, puny and contemptible specimen of humanity that she had ever seen, was a task before which my voice grew husky, and my whole frame trembled with self-distrust.

She, however, appeared to be utterly oblivious to these tokens of embarrassment in my manner, and talked away with such a hearty good-nature and so much intelligence upon topics relating to the customs of the country, and objects of interest about the park, that I soon came to feel quite at home in her society. Indeed, I had never been more favorably impressed by any woman, young or old, whom I had ever met. Beautiful without being vain, cultured without being pedantic, dignified without being haughty, and modest without being diffident, there was thrown over all a simplicity and artlessness of manner which in almost any other young lady I would have regarded as either the hight of affectation, or an evidence of the want of familiarity with the world. But in Miss Flyter it was like an elegant setting to a costly pearl, or a handsome frame to a picture of rare beauty and excellence.

It may be supposed that I fell desperately in love with this very lovable young lady. Nothing would have been more natural, under ordinary circumstances. In fact, I believe I did on two occasions make observations which any other young lady of my acquaintance would have construed into an evidence of admiration, but they were as completely lost upon Miss Flyter as they would have been upon my grand-aunt. The effect of this was to make me more circumspect, but did not in the least diminish my admiration for the young lady.

CHAPTER XI.

LIVING BY THE CLOCK.

I RETURNED with Mr. Flyter from the park, and for several weeks enjoyed the hospitality of his home. It was indeed hospitality, in the truest sense of that term. For though I was an utter stranger and quite an insignificant one at that, all the members of the household served to vie with one another in promoting my enjoyment and making me feel entirely at home. It was not indeed a difficult matter to keep me entertained, for everything which I saw and heard was new and interesting, and I was an eager student of the manners, customs and institutions of this noble people.

Mr. Flyter's home was a spacious mansion surrounded by a plat of ground of half a square in extent. His brother-in-law and his family occupied a similar mansion on the other half square. The grounds about both these mansions were laid out with exquisite taste, and kept scrupulously neat and flourishing, by the personal care and labor of the members of the households. Servants among the people were few and no one thought it beneath him to take a spade, shovel or pickaxe in his hand and perform that labor which is usually thrown on the shoulders of John or Patrick. And I might add that there was not one among them with whom John or Patrick could for a moment compete, either in skill, strength or physical endurance.

Mr. Flyter's household consisted of himself and wife, his son and his wife, his grandson and his wife, and their son and daughter. His brother-in-law's family was composed of the same number and the same order of generation. Several other families whose acquaintance I made, possessed this same peculiarity of number and relationship. In fact, I found that it was the universal custom of the country for the father, son, grandson and great grandson, with their wives, to form a common household, and I was told that it was not an uncommon thing to find five generations having everything in common and living happily together under the same roof.

The question naturally occurred: What becomes of the supernumeraries—if I may so term them—of large families and those who are not fortunate enough to secure husbands and wives; for I invariably found that there were but two of each generation in the same household. I put this question to Mr. Flyter one day, and it may well be supposed that the answer which I received gave me some new and interesting ideas on a very important question of sociology.

"Why, sir," said he, in reply, "there are no supernumeraries in our families, and none who pass the marriageble age without marrying. Every married pair have two, and only two, children, a son and a daughter. The son invariably finds a domestic partner at about thirty years of age, and the daughter is considered marriageable at twenty-five, and seldom has to wait long after that age for a husband."

"Happy people!" I involuntarily exclaimed, "among whom a domestic partner is assured to every one. "But, sir," said I, "I am curious to know how you regulate this matter of progeny. In my country, where there are many of both sexes who never marry, the number of children which are likely to be born to any married couple is very uncertain, and the sex of those children is equally as uncertain. Doubtless this matter of hereditary transmission is governed by immutable laws, but if it is, they are practically unknown among us, and the number and sex of a man's children are a mere matter of chance. Thus, while I know of some married couples who have no children at all, others have a dozen or more; and while in one family the children may be all boys, in another they are just as likely to be all girls. Besides, there are many diseases which make such terrible ravages among our children that sometimes whole families are swept away before they reach maturity. So you may well imagine that it is a source of wonderment to me to find living under the same roof a family chain of four or five generations without one supernumerary or broken link.

"I suspect," replied my host, "that you gave the true explanation of the difference between our people in this manner when you said that there were doubtless immutable laws which determine the number and sex of children, but that those laws are practically unknown among our people. Now, among us these laws are well known and thoroughly obeyed. In fact, it is a matter of necessity with us that they should be known and obeyed; for you must understand that our population has about reached the limit of the capacity of the land to sustain, so that an increase of even one child to every married couple would result in much suffering, and even starvation among the inhabitants. Thus each married pair seek only to reproduce themselves in one son and one daughter, that the number of our population may be sustained at the limit where the best interests of all shall be subserved."

"But, sir, said I, "in our conversation the other day you spoke of your country as being many millions of square miles in extent. You surely do not mean to say that this vast region is fully occupied, and that it has reached the full limit of its production."

"I do indeed," he replied. "There is not a waste or barren spot in its whole extent. There are mountain ranges, it is true, whose snow-capped peaks and rocky sides might at first thought be considered barren, but they subserve a very essential service in the productiveness of the valleys and plains, so that they are by no means barren in the sense that they are useless: while in regard to the productiveness of our soil, it is enough for you to know that it is a general estimate that the product of an acre will afford an abundance of food for a family of ten."

"Am I to infer from your remarks, sir," said I, "that ——" Here a bell sounded, which caused Mr. Flyter to spring up so abruptly that I verily thought that he must be a member of a fire company, and that the bell was an alarm of fire.

"Put on your hat and go with me to the gymnasium," he said.

I obeyed, wondering how he knew that it was the gymnasium that was burning. As we passed down-stairs we found the other members of the household on the move, and when we reached the street a tide of people seemed to be moving along, all in the same direction, its number being constantly augmented from every house and cross-street.

Observing that there were as many women as men in the throng, and that they were altogether a very jolly company to be hurrying to a scene of

conflagration, I quietly observed to Mr. Flyter:—"Are you sure it's a fire?"

He turned about and looked me full in the face with a very searching glance for about a minute before he replied. "Fire! No."

It was not the first time that my sanity appeared to me to be called in question since my advent among this people, and I resolved in future to think before I spoke and to be less hasty in jumping at conclusions.

When we came in sight of the park I observed that the people were crowding into the three gymnasia, which were a feature of every park, and it then occurred to me that the bell which I heard was rung to summon the inhabitants to their daily athletic exercises. This people had a Grecian love for athletic sports, and, as a result of this, a strength, vigor and beauty of physique which would have made them models even for that æsthetic and physically perfect race. And they showed the same method and regularity in taking physical exercise as characterized their habits in all other particulars. In fact, the methodical habits of this people were a source of continual wonderment to me; and on many occasions I could not suppress a smile at the conscientious promptitude with which every duty was performed. I had known individuals in my own country who divided up their time with sharp-cut exactness; who had regular duties apportioned to every hour in the day, and carefully observed rules as to eating, sleeping, exercise, etc., and I had been accustomed to ridicule the punctiliousness of these persons in thus imposing on themselves rules and habits which I thought could not but be irksome for them to follow. But here were all the people of a great city—and I was told that the same was true of other cities in the country—all actuated by the same principles in regard to their habits and mode of life, and living up to those principles with punctilious exactness. And what was the more remarkable in regard to the regularity of their habits was that they were under no constraint in the matter except the constraint which habit imposes when it becomes second nature, and when it is sanctioned by the conviction of the intellect that it accords with the truest and best interests of the individual.

To be continued.

BRIC-A-BRAC.

THE PLACE HE WANTED.

A Galveston millionaire was asked recently by a delegation of his friends if he would not consent to allow his name to be used in connection with the United States Senatorship. He replied that he never had meddled in politics before, but just now he had made up his mind to apply for a position other than the Senatorship. "Ah! I suppose you want to get on the Supreme Bench," said one of the committee. The heavy property owner shook his head and toyed with his $5,000 diamond ring. "Perhaps Garfield is going to offer you a place in his Cabinet?" "No. You havn't guessed it yet." "Foreign mission?" "Gentlemen, I'll be candid with you. For years I have been trying to get the city authorities to have the slop barrel at my back gate emptied once a month and have failed. I am determined to have that slop barrel emptied, and I have applied to the City Council for the position of driver to a scavenger cart."

LOVE'S CALENDAR.

THE Summer comes and the Summer goes;
Wild flowers are fringing the dusty lanes,
The swallows go darting through fragrant rains,
Then, all of a sudden—it snows.

Dear Heart, our lives so happily flow,
So lightly we heed the flying hours.
We only know Winter is gone—by the flowers,
We only know Winter is come—by the snow.

—T. B. Aldrich.

AN OLD TABLE.

"That is surely the oldest piece of furniture in England," said a collector of antique curiosities to a friend, pointing to a venerable-looking table, as he spoke.

"How old is it?" asked the friend.

"Nearly 400 years."

"Pshaw! that is nothing. I have an Arabic table over 2,000 years old."

"Indeed!"

"Yes; the multiplication table.

The scaly scamp! to be so sly,
(If he didn't tell a lie,)
And to neither laugh nor cry
Is almost past belief.
But to have "squealed" would not have done,
For then he'd have to cut and run,
And, too, he would have spoiled their fun,
And brought himself to grief.

MODEST MUSE.

HIS BREAKFAST ORDER.

Mr. Setemup came down stairs to a 10 o'clock breakfast with a vacant countenance and a backward tendency in the hair that made his two eyes ache. He sat down at the table and picking up a knife and fork, glared in uneasy wonder at something on the platter before him. It had evidently been fried in butter, and was evidently intended for food. Mr. Setemup harpooned it with his fork and lifted it up bodily, gazing at it with ever increasing wonder.

"What under the sun," he exclaimed at last, "is this thing?"

"Well," replied his patient wife, with just a shadow of a sigh, "it looks like your new soft felt hat, and that is what I thought it was, but you pulled it out of your pocket when you came home this morning and said it was a porter-house steak, and you wanted it broiled for breakfast. You needn't give me any of it; I'm not hungry."

And Mr. Setemup, who was just will to know what else he said when he came home and what time it was, for the life of him didn't dare to ask.

For Women.

CONDUCTED BY MISS RAY CLARK.

THE FLOWER GIRL.

LILIES! lilies, of the vale!
Buy my flowers, they're all for sale,
Sure such beauties ne'er were seen,
Hiding 'neath their mantles green;
Gentle lady, would you know
Where my drooping treasures grow?
In a sheltered shady nook
Close beside a running brook,
Where the birds unceasing sing,
Flowers in rich abundance spring.
Violet and snowdrop sweet
Bloom unheeded round my feet;
For, in vain, they would compare
With my lilies, pure and fair.
By their precious fragrance led
Soon I reach a mossy bed;
Where, secure from every eye,
Lilies spring and flower and die.
Roused from sleep, I bring them you,
Fresh and wet with morning dew;
See them now, so sweet and pale,
Buy my lilies of the vale.

SILK CULTURE IN AMERICA.

For Women, Girls and Children to Read, who wish to Make "A Little Money."

MARY WAGER-FISHER.

It is rather more than two hundred years ago that the culture of silk was begun in this country, in the Colony of Virginia.

James I, who hated tobacco, believed that the cultivation of the silk worm would succeed in the genial climate of Virginia, and if so, it would supersede the raising of tobacco. Although great effort was made to encourage the cultivation of silk by the British Government, the result was a failure. Tobacco was more profitable. Enough raw silk had been raised in the colonies, however, to make the coronation robe of Charles II.

The effort was again made in Georgia, and from 1766 to 1774 the annual export of reeled silk (a reeling establishment had been opened at Savannah) amounted to, from five hundred to a thousand pounds. But as cotton became vastly more profitable, the culture of silk in Georgia was abandoned. In 1760 silk culture was begun in Connecticut and continued for eighty or more years. About half a century ago, a general revival in behalf of silk culture, extended over all the Eastern and Western States, and a great rage for the Morus multicaulis, (many-branched mulberry) sprang up, so much so that as high as five hundred dollars a hundred were paid for cuttings. But the enthusiasm proved to be a bubble, which burst a short time before 1839, since which time there has been less silk raised in the entire country, than there was in Georgia 120 years ago.

The success of every valuable industry has its period of probation, and there seems to be no reason now, why the culture of silk in this country cannot be made a very profitable employment. Heretofore, there has been no home market for the cocoons and no machinery for reeling the silk; now the immense silk mill of the Cheney Brothers at South Manchester, and the seventy-seven silk factories in Patterson beside 140 others in various places furnishes a market for all the silk that can be raised in America for some years at the least. American silk has reached such a degree of texture and beauty, that increasing orders come for it even from France, the land of the silk worm and of silk manufacture.

In the neighborhood of Philadelphia there has recently been considerable experimenting by various intelligent persons, in silk culture, in order to test the feasibility of cultivating the silk worm and the results have been so successful and entirely replete with encouragement, that various philanthropic women have formed an association, known as the "Women's Silk Culture Association of the United States." Perhaps I should add that this society is not the outgrowth of experiments in Pennsylvania alone but also of a belief in the theory in many other places.

However, people always have most faith in that with which they are personally acquainted. Persons who have attended the Pennsylvania State Fairs, for the past two years, know something of the work being done by this association from its exhibit in the Exhibition Building.

As $12,000,000 yearly go from American manufacturers to foreign countries for raw silk, it certainly was both a philanthropic and patriotic idea to endeavor to keep as much of that goodly sum as possible at home to enrich the pockets of thousands of our own countrywomen; thrifty, ambitious women and girls in rural districts, who rack their brains for some way in which they may earn a "little money"—by interesting and engaging them in the culture of silk. It is a work for which women are entirely fitted, and also has the advantage over many occupations of being carried on at home. It is capital for children, too, who become intensely interested in the curious and wonderful cocoon makers.

The practical features of the Association consist of a school in which persons are taught to care for the silk worms through all their stages of development and to reel the cocoons—for American artisans are now endeavoring to make the best possible apparatus for reeling silk, so that filature of it may form part of the silk culturist's Winter work—to furnish silk worm eggs and trees and cuttings of the most approved sort of mulberry trees for the worms to feed upon; and a small book, or brochure, which gives full information as to what and how to do in order to successfully cultivate silk. This little book costs one dollar, but several persons in a neighborhood, moved to undertake silk culture, can club together and procure the book at very much reduced rates; the eggs cost one dollar a thousand, $5 per ounce. Ordinary mulberry cuttings (it is the best way to propagate from cuttings) cost $1.50 per hundred.

Now for some figures concerning the profits of silk culture. Raw silk commands from $4 to $3 per pound, according to quality; cocoons and floss silk from $1 to $1.50 per pound. Two hundred mulberry trees will grow on two acres of land, which would yield about 30,000 pounds of leaves. About 16 pounds of leaves make a pound of fresh cocoons, which would yield about 1,765 pounds of fresh cocoons. These, when stifled (dried) would weigh about 588 pounds and the dry cocoons at $2 per pound would amount to $1,176. A fair estimate for expense would not exceed $160, leaving a balance of $1,016, on two acres of land and in one month's or six weeks' time. Where two crops are raised in the Summer, as may be done, of course the profit is proportionally greater.

Another feature of the association—and a very important one—is that it will buy all the cocoons raised by women, however small the quantity. This the silk mills will not do, but the mills will take from the Association the raw silk if it can furnish it to them in large quantities. Of course large factories can only buy at wholesale. The Association also supplies silk worms at the proper season, at $1 per hundred. Perhaps I should say that this is purely a philanthropic society, chiefly supported by persons who are sufficiently interested in this subject to be willing to put their hands in their pockets and draw out the necessary funds for its support; especially to benefit their countrywomen. If anybody who reads this wishes to make a donation to this worthy cause, or to solicit more specific information than I have given—and there is a great deal more to be had—address the Women's Silk Culture Association, 1,328 Chestnut street, Philadelphia. Don't forget to enclose a postage stamp, for any reply that you may desire.

That silk culture in this country can at this time be made profitable by country people, is, I think, unquestioned by persons who know anything about it. But, like all new industries, it should be begun by the uninitiated in a small way at first, and gradually improved upon as one obtains experience and success. I have no doubt but that if a large number of RURAL readers express a desire for more information in regard to silk culture, with a view to undertaking it, that the editor of this journal, with his usual generosity, will make room for it and give from time to time hints and suggestions that will prove helpful to the young silk culturists. Perhaps ere long there will be need of a "silk culture department." When we produce our own silk, and tea, and sugar, what airs we can take on!

DECORATIVE ART NOTES.

M. G. H.

It is a significant sign of the progress of the artistic spirit in this country that so many of our most prominent artists are engaged in household decoration.

This is walking in the footsteps of the old Venetian and Florentine masters who brought the best of their art to serve domestic ends, and have left a legacy which we think it no burden to cross the water to obtain.

In almost all houses are antiquated mirrors whose frames, either tarnished or scaled have made them unsightly or useless. The glasses unless broken are usually very true and worth preserving. A new fashion comes happily to their aid. Have plain wooden frames made for them, at least three inches wide, and then decorate them.

A beautiful mirror of beveled glass has one of these frames stained with oil paints in varying shades of brown; across the top and drooping on one side is a branch of snow balls whose roundness and perspective is finely shown. Another has a naked branch on which is perched a flock of snow birds; on the opposite corner spring branches of golden rod. A third is covered with crimson plush. Across one corner passes a band of gold satin with a motto, holding a bunch of peacocks' feathers falling over the glass. At the bottom, painted on the plush, are up-springing daffodils, whose brilliant yellow petals are of natural size.

The most artistic and effective fabrics are now produced by ladies at their own homes by purchasing the common brocaded goods, and following the patterns with crewels in South Kensington stitches. The selection of the colors requires some judgment, but any one at all familiar with the harmonies and tones now demanded in all good work will have no difficulty. These goods so embroidered are used in upholstery for fancy chairs and also for table covers. Cheap laces of good designs are treated in the same way and combine effectively with the stuffs.

Industrious ladies have their recompense in some pretty articles for feminine adornment which it is not given for the idle to appropriate. The most artistic of these are long scarfs of silk slipped through an ivory ring, which are to be worn over the arm, and which conceal a work bag in their folds. Such a one of dark blue-green silk is made double, with fringed ends on which are embroidered delicate flowers in blue with their foliage. A slit reveals the pink inner lining and opens the way to the pocket. Others are of pongee lined with color, and decorated in outline stitch with quaint figures from Mother Hubbard, Edward Lear, and Kate Greenaway designs.

For home use, use pongee silk aprons. These are turned up at the bottom forming the pockets and embroidered with delicate sprays in stem stitch, and with such old-fashioned flowers as the French pink, known in art as corn flowers, wild roses and daisies. Another was very appropriately ornamented with the clearly defined words in olive greens, "How doth the little Busy Bee," with here and there outlined an illustrative busy bee.

One of the most beautiful examples recently seen of painting on satin was a long hanging screen of old gold satin bordered with olive green plush, on which was painted an owl with wisdom in his wide, staring eyes, his feathers properly ruffled, and seated on a branch of mountain ash, with its leaves and bright crimson berries. It was beautifully done and very effective.

RUGS.

I PRESUME that most of the RURAL ladies have seen, and probably many possess, an old-fashioned, blue and white coverlet: in many homes they are preserved as relics, because," "my mother," or, "my grandmother wove it," but in others they have served faithfully for years as a bed-covering, until time and usage have brought them to such a state that they have been ignominuously banished to the garret or store-room, or, worse yet, to the barn to be used for a horse-blanket; to cover a ragged cushion, or for some other useful purpose.

Beautiful rugs can be made of these "cast-aways." Those that have blue and red grounds, do not make pretty rugs, but those with a blue ground and a white pattern, or brown and white ones, are "just the thing"

Not long since, as I was driving through the city, a country wagon passed by, loaded with cabbage, over which, as a protection from the cold, was thrown one of those blue coverlets pretty much worn about the edges, but with enough that was good in the center, to make a couple of rugs. The pattern was beautiful, and a vision of the pretty things I could make out of it, rose before my mental eye sight, I could scarcely refrain from shouting after the driver to try to induce the owner to part with it.

To return to the subject; having cut your coverlet the size you wish to make your rug, allowing for the edge to be turned under, the next thing required is a medium sized worsted needle and several half-bunches of Germantown wool. Taste must be used in the selection and arrangements of colors. Three or four colors, are enough, although a "medley," in which all colors have been worked, makes a nice effect. Work on the darkest side of the cloth and follow the white pattern, using *any* or *many* stitches, only keeping a fixed idea throughout the whole. Cross-stitch straight lines, dashes, fans etc., *ad libitum* can be used.

Sometimes there is very little of the white pattern and a great deal of the blue ground; in that case, "make up" a pattern and work it with the brightest colors on the blue. It is very fascinating employment and well repays one for the labor, when it is completed.

For the border, a cheap woolen fringe, new or old, is pretty but I used strips of cloth cut from a pair of old pantaloons. A strip of black about two inches wide next to the rug, then a strip of gray, and lastly another black strip, about four inches wide. The outer edge of each strip was overcast—button-hole stitch—the stitches being quite far apart. The edge of the rug was basted under and overcast on to the first black strip, and that strip lapped over the gray and the gray in turn over the black. Then on each strip of cloth I worked some fantastic patterns—dashes, triangles, fans etc, then lined the rug part with a piece of old carpet. This must always be done, though something beside carpet may be used: the rug should be pressed on the wrong side before it it is lined. This same work makes lovely chair covers, stool covers, etc. MRS. W. V. A.

FASHIONS.

EMBROIDERY and hemstitching in the highest styles of decorative art are now applied to table linen.

Plush will be used upon spring costumes of cheviot, cloth and cashmere.

Uncut velvet in changeable colors will be used this season as a dress trimming.

Large fans are again in vogue; the handsomest are decorated with hand-paintings of roses, &c.

The old-fashioned flowing sleeves of lace are again popular. The wide directoire collars are worn with them.

Dove-colored silk stockings embroidered in colors to match the toilet are the very latest novelties in French hosiery.

The Spanish fashion of wearing black kid gloves with full evening dress still continues. The most dressy of these have lace insertions on the long arms.

Chenille flowers and foliage are very fashionable; they are used for coiffures and the trimming of bonnets, and are especially pretty and effective when twisted among the braids and coils of the hair.

Tamboured muslins are once more revived, and ladies are decorating plain mull and batiste with insects, flowers, etc.

Some of the new Spring bonnets are studded with mock jewels, and some of the fancy braids are dotted with tiny straw buttons and crystal beads. The bright yellow straws have the precedence of the pure white, although the white chips are unusually delicate and beautiful, and are exceedingly graceful in shape. The Belgian split satin braids and the Florence and Tuscan straws are equally attractive and new in design.

Among imported dresses are those that fasten in the back with hooks and loops.

A favorite trimming on new Spring dresses consists of real Spanish lace and jet trimmings.

Initial letters from ancient manuscripts are used to mark table linen.

Very wide shaded ribbon is employed in millinery and shaded feathers are in great demand.

There are bonnets of all shapes and sizes among the new importations; pokes of moderate dimensions are favorites—so are cap bonnets.

Novelties in dress fabrics are the variegated and shaded stripes in silk and wool; also striped surahs and satins. These goods are made up in combination with plain material in one of the prevailing colors of the stripes.

MISS CLARA GOODYEAR won the second prize offered by the Society of Decorative Art for a needle-work design for a three-fold screen.

The vigor of youth given to the aged and infirm by using Hop Bitters. Try it.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THE WELL-DOING OF WORK.

R. B.

"WHATEVER is worth doing at all is worth doing well."

If by "well" is meant in the best manner possible, I do not believe it. There is much time and strength wasted for want of a judicious—not slighting, for the work is no slighted if it is done as well as is worth the while—proportioning of the amount of labor to the occasion.

I am no advocate of careless, slipshod work; I believe in thoroughness, in long apprenticeships, in perseverance that amounts to obstinacy, in mastering every step in the trade or profession, in skilled laborers, in nicety of detail and fineness of finish; but I dislike to see labor, and care, and time, and skill wasted on something that is really of little account; wasted, when they might be devoted to worthier objects.

The versatility of the American people is making a nation of dabblers, but I am not ready to approve of that while I protest against doing everything in the best possible manner. It is well, it is best, to know a little of everything and a great deal of one thing. A liberal education gives us the first; the rudiments of many things with the discipline and culture that comes with study, and lays the foundation for learning much of one thing—the life work. This primary dabbling is right. It gives us an insight into things that would otherwise be sealed books to us and makes us intelligent listeners and lookers-on where we have no active part. It is almost indispensable to the well-rounded character, and the help it gives in prosecuting the one thing is incalculable. But if that some one thing is not well-learned, the Jack-of-all-trades-and-master-of-none falls far short of the mark. His case is not one where I wish for an application of my text modified from "well" into "well enough."

I had a class-mate who used to rise early and retire late, who had little time for library books, rest or recreation, because everything must be done so well. Lectures, note-books, exercise-books must all be copied, and the laborious re-writing consumed a great deal of time, which seemed to me then—and does still—a great waste, and that might have been much more profitably spent. My first copies were very readable, and I felt that they were quite well enough done to be laid away, and be very seldom seen, when school-days were past.

I remember well how my elderly relatives used to patch. A smooth, beautiful piece sewed over and over like embroidery, when, likelier than not, the garment was only a little too good to be discarded, and consequently it shortly fell away from the patch, and all that superfine sewing was lost. And the darning that was finer and prettier than the stockings; the overcasting close and even enough for trimming, when half the number of stitches would have made it neat and serviceable!

I know a housekeeper who sweeps and dusts religously, who goes over rooms but little used as regularly as the day comes, and she is as guiltless of ideas as her house is of dust. Wouldn't it be better to let both accumulate a little? We couldn't excuse the corners or festoons of cobwebs, but thoroughly done one day, and with only just a hint of dust the next, mightn't that indefatigable duster better give a rapid "fleck and a promise" and she sit down to some of her husband's books, which she "never has time to read?" Instead of continually dusting the binding of Lowell and Little Classics, to read The Vision of Sir Launfal or Rob and his Friends; either would take no longer than one day's circumspect scouring, and her book-shelves are full of such gems!

The problem is, where to draw the line. It cannot be drawn except in a very general way; experience and common-sense must teach each one to do that for himself. Be methodical, systematic, thorough, for that is to be efficient, but there is nothing incompatible in all this with a little judicious "well enough," which is only a kind of abridgment, or shortening of methods to suit the case.

WASHING AND WASHING MACHINES.

SEEING an inquiry in the RURAL for an easy method by which the family washing may be done "without the expenditure of such hard labor," I venture to say a few words in regard to this much dreaded part of housework.

In the first place there is no royal road to the wash-tub and the accomplishment of clothes washing. Much depends on the length of time the clothes have been in use since last washed, and the occupation of the wearer. Some employments soil clothes vastly more than others—and here let me suggest a change of garments at least twice if not three times a week. Also much depends upon the conveniences for washing—having water and fuel near at hand, which otherwise consume both time and strength in getting in readiness for the day's work. Convenience is labor saving, and economy, too, in the end. It saves much exhaustion of patience and vexation of spirit. My method of washing is an old-fashioned one, and is as follows: The day before washing get the clothes and sort them, preparatory to soaking them over-night, putting the cleanest ones in a tub by themselves, and the dirtier ones in another; cover them with water in which there is some soap, and let stand. Having thus soaked them, wring them out with a clothes-wringer next morning. Proceed to pound them in a nice suds in a barrel with the clothes maul, sorting them and changing water when necessary. They should be pounded through a second time, by which process they are now ready for boiling, with perhaps the exception of a few wristbands, which will require a little rubbing on the wash-board. Have the water in the boiler entirely cold; add a little soap; put in the clothes; bring to a boil, boiling 20 minutes; take out, put into clear, hot water, as this discharges the soap and remaining dirt, after which rinse twice, in the last "blue" them and hang them up to dry. I use no washing fluid, as all such compounds have a tendency to destroy the fabric.

It is true that a multiplicity of inventions and appliances are every day being thrust upon our notice in order, as their originators claim, to lighten the task and make washing no work! but, in fact, really to put money into their own pockets at the expense of the laboring classes. They are nearly all, if not wholly a fraud, a contemptible cheat. Among these is the notable "Robbin's Washer and Bleacher," about which such a hue and cry has been raised. One of these machines was left at our house with a request from the agent that I would use it and give him my opinion of it. I followed the directions, curious to see the little device, or rather *humbug*, begin operations, which it did after consuming nearly one-half a cord of well seasoned, hard wood. The water began discharging through the tube, a little suds and a little puff of air about every alternate second, the former of which fell on the clothes a few inches from the tube, scarcely any force being perceptible. What it accomplished I failed to discover, unless it was a dreadful waste of fuel. I could have attained the same results without it. In my opinion it is of no benefit whatever in the process of working.

Its invention seems to be based merely on the fact that suds in a boiler brought to a certain degree of heat will discharge the dirt from soiled garments, under certain conditions. But to plunge clothes dry into boiling water without previously soaking them, "yellows" the garment and spoils them, as many can testify who have tried this ingeniously contrived humbug. I would not give a penny a ton for them for my use; hence I regard them as a complete nuisance. Plain common sense, plenty of soap and water, and fuel and a convenient wash room with its appurtenances, together with willing hands, will tend greatly to dispel even the horrors of washing and washing-day.

MRS. M. H.

A QUESTION.

MARY WAGER-FISHER.

Is there any reason why old-fashioned people should not be new-fashioned enough, to carry their food to their mouths with a fork instead of with a knife? Is there any reason why a farmer, any more than a merchant or a banker, should shovel his food into his mouth, as if that receptacle were a granary or a corn bin? Is there any reason why the mother, or the father, should mortify the grown-up daughters by drinking their tea from the saucer instead of from the cup?"

Summer Sausage.

Sausage may be kept for use in hot weather by frying the sausage as for immediate use, packing it tightly in a jar, and covering with hot melted lard. Cover the jar closely and set in the cellar. When wanted for use, take out the pats, or balls, and heat in a skillet, as in frying. The "Pennsylvania Dutch" fry tomatoes in their season, and pack away in a similar fashion for Winter use. The sausage I know keeps perfectly, and the tomatoes I have been assured keep equally so.

DOMESTIC RECIPES.

Red Wash for Bricks.

MELT one ounce of glue in a gallon of water; while hot put in a piece of alum the size of an egg, one-half pound of Venetian red and one pound of Spanish brown. After trying upon the bricks, if found too dark, add water, if too light add red and brown.

To Kalsomine Walls With Paris White.

To give the walls of a large room, say 16 by 20 feet, two coats, it will require about one-fourth pound of light glue and five or six pounds of Paris White. Soak the glue over night in a tin dish containing a quart of warm water. If the wash is to be used in the morning, set the dish containing the glue into a kettle of boiling water over the fire, adding a pint of cold water to it. Stir the glue until all dissolved and quite thin. Put the Paris White into a clean pail and pour over hot water until of the consistency of thin cream. Now mix the glue mixture with the whiting and apply with a fine whitewash brush. It may be too thick, in which case thin with hot water.

MARY B.

Baked Eggs.

Take a common earthen platter with a flat bottom and set into the oven until hot; butter it, have the eggs broken and slip them carefully onto the dish. Sprinkle over a little salt, allow a spoonful of cream to two eggs, put directly into a quick oven and bake four or five minutes—very nice.

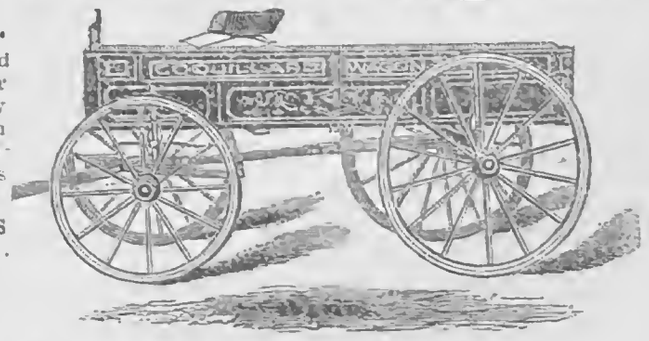
A. COQUILLARD,
South Bend, Ind.



Trade **LONDON PURPLE.** Mark.

Valuable insecticide for the extermination of the COLORADO BEETLE, COTTON WORM and CANKER WORM. For prices, Circulars and Opinions, write

HEMMINGWAY'S LONDON PURPLE CO., (Limited) 90 Water St., New York.

Professor C. V. Riley says: London Purple can be more effectually sprinkled or sprayed on to the plant than Paris-green by virtue of its greater fineness.

Professor C. E. Bessey says: It promises to be a most excellent remedy. It quickly kills both the Larva and the Winged Insects.

Professor J. L. Budd says: A single application placed every one of the pests on their backs over the ground, either dead or in a dying condition, in less than six hours.

News of the Week.

HOME NEWS.

MONDAY, March 28, 1881.

Gen. Grant has resigned the Presidency of the World's Fair Commission. He gives as his reason for so doing that the exhibition wants at its head a man who can give his whole time to the work. As his engagements would take him out of the country for three months when his presence here would be most needed, and as, on his return, other engagements, which could not be ignored, would demand his attention, he thought it best to give some one else the position. He thinks it would be wise to postpone the fair until 1884 or 1885. Mr. Hugh J. Jewett, President of the Erie Railway, is proposed for the vacancy.

An organization of females styling themselves "The Working Women of Chicago" met in that city, Wednesday, and put in nomination for city officers the same ticket nominated by the socialists.

It is stated that a party of Mormons have settled in Ancora township N. J., who announce the intention of practicing polygamy.

The Rev. D. P. Mitchell of Topeka, has been found guilty by his Methodist Conference of using the church money dishonestly to promote his candidacy for Congress.

The shippers in Buffalo are anticipating the most lively season in navigation in years. Navigation is not expected to open before the last of April. There will be about 200,000,000 feet of lumber shipped this year and about 300,000 tons more of coal. The iron ore shipments will exceed last year's by 500,000 tons.

Kalloch the murderer of De Young of San Francisco, has been acquitted. The verdict was received with much applause, and the defendant was heartily congratulated by his friends. When Kalloch was discharged and got into a carriage to go home, an immense crowd took the horses from the vehicle and pulled him to his house, about three miles distant.

Fine old trees are being ruthlessly cut down in New England. "The Parsons Elm," the largest and handsomest tree in Enfield, Conn., dating back beyond the memory of living man, was laid low by its owner, to get thirty-five cords of firewood out of it.

Western Reserve College, at Hudson, Ohio, is to be removed to Cleveland, as was decided by a vote of the trustees. Amasa Stone, of Cleveland, gives $500,000 to the college, on condition that the city shall raise money for the site, which has been already done. Another condition is that the name is to be changed to Adelbert college, in honor of a son of Mr. Stone who died some time ago.

Ex-Secretary Schurz was honored with a banquet by the Bostonians on the 22d inst. All that portion of his party that parts its hair and its convictions in the middle, as an exchange says, were present. Mr. Schurz made them a little speech on the Indian question, and closed with a eulogy on the present prosperity of the nation.

An extra session of Congress, which by some was thought necessary, was by others as firmly opposed. Protests have been sent to the President from commercial and business centers, and public feeling seemed to be against it. So the President decided not to call an extra session. It is thought that much unnecessary legislation would have been introduced, which can be brought up at the next regular session as well, the only necessary legislation now demanded being on the Refunding Bill.

And now the report comes from Gen. Sheridan that 30 persons have been massacred and 19 wagons burned by the Indians near Janos, Old Mexico. The moral suasion policy is a good one in some respects, but some of these red-skins can remember a flogging longer than they can a sermon.

A table showing the valuation of real estate and personal property in the 60 counties of this State has been lately completed at the Census Office. The real estate column foots up $2,326,669,813, and the personal property amounts to $852,469,320.

Buchanan, the bogus diploma maker of Philadelphia, has made a confession wherein he gives the names of wholesale druggists in that city who, he says, have sold his diplomas. Ten thousand names, preserved by him, are included in his disclosures. He says that 25,000 of his diplomas are current in America and 40,000 in Europe.

The work of tunneling under the Hudson River is going on satisfactorily. Two hundred men are employed by the company. The completed portion of the tunnel advances five feet every day toward the New York shore. The whole distance completed thus far is 290 feet from the shaft. The superintendent says that on the New York side the company is getting ready to begin work at the foot of Morton Street. A caisson is building and they will soon be working at both ends. The whole distance is 5,500 feet. If they advance at the rate of five feet at each end every 24 hours, it will take something like 18 months to complete the work.

President Garfield at his inauguration occupied the chair from which Washington rose to take the Presidential oath in 1789. This relic has been in charge of William C. H. Waddell for the past 50 years, who forwarded it to Washington at the request of the Inauguration Committee.

Mr. Thomas A. Scott has recently made gifts to several Philadelphia institutions, amounting in the aggregate to over $150,000. Of this $50,000 go to the endowment of the Chair of Mathematics in the University of Pennsylvania, $50,000 to Jefferson Medical College, $30,000 to the Orthopedic Hospital, and $20,000 to the Children's Department of the Episcopal Hospital.

Settlers in Nebraska have had a rough experience this winter. One of them writes of a neighbor's having had a child die during a violent snow storm and being unable to bury it for over a week, it being impossible to get through the deep snow with it. When the farmers rode to town to get the mail or groceries they invariably took shovels along to dig a way out in case their horses got stuck. The early arrival of Winter took many by surprise, and a large quantity of corn was left in the fields, of which urgent need has since been had.

The city of Bath, Me., on the 19th inst., celebrated the 100th anniversary of its incorporation as a town by appropriate exercises consisting of a historical address, oration and poem. Salutes were fired at noon. There was a grand reception in the evening.

A bill to remove the restriction on suffrage in New York State, based on sex, was reported in the Assembly for the consideration of the House. This is to allow women to vote at all elections.

Official advices have been received by the Government from Matamoras than tons of infected rags are being constantly shipped from Mexico to the United States, destined to large manufactories, where they are ground and used in the manufacture of paper. The matter is being investigated with a view to punishing the offenders.

The labor troubles at Fall River, Mass., are not yet settled. There is a strong feeling that the result may be a general strike, for the unions say it is a blow struck at them, and they are very indignant over the matter. On the other hand, the manufacturers say that they are wearied with these continued agitations, and do not like to be dictated to by the help. They have got the right, they claim, to run their mills themselves. The rumors set afloat that they are running over time and paying lower wages than other places they indignantly deny.

[Ypsilanti (Mich.) Commercial.]

Our representative lately learned the following from Mr. Carl Siegmund, Cor. Congress and Washington Sts.: "My daughter suffered from Rheumatism to such an extent that it crippled her, rendering her unable to walk at all. We consulted many physicians and used all kinds of medicines, but in vain. At last St. Jacobs Oil effected the happiest results. It cured my daughter."

AGRICULTURAL NEWS.

The Ohio State Board of Agriculture, following the example of that of Illinois and the Illinois Legislature, strongly indorses Mr. Emery Cobb for head of the Agricultural Department. Dr. Loring of Massachusetts, at present *seems* to have the "inside track," however, we are sorry to say. ....

AT a recent sale of ostriches at Port Elizabeth, Cape of Good Hope, the following prices were obtained:—Two pairs of breeding birds at $650 per pair; one ditto at $625; two ditto at $600; one ditto at $1010; two ditto at $525; and four ditto at $500. Some younger birds sold on the following terms:—Three pairs at $112 per pair; five ditto at $375; three ditto at $325 and four at $300. Ten young ostriches sold at $325 to $312 per pair. Fifteen young birds realized $140; and twenty changed hands at $125....A mechanical contrivance to facilitate horse breaking, invented by Major de Lange, and already introduced into the Russian cavalry, is, on the recommendation of the French Cavalry Commission, about to be tried at Saumur. This "*ressort-dresseur*" is an artificial hand, attached to the animal's lower jaw. It combines softness with resistance, and is a substitute for the breaker's hand. It is said to obviate much rough treatment.....The increase of creameries in one county of Southeastern Pennsylvania (Bucks), is from one in 1878 to forty-two at present. The farmers prefer creamery stock to bank or railroad stock, finding the business of making butter and cheese, under their own management, and according to latest improvements, more profitable than raising grain or cattle.....Mr. F. B. Harper is said to have priced his stallion Ten Broeck to a party for $75,000. He has made the fastest mile, 1.29¼; the fastest two miles, 3.27½; the fastest three miles 5.26¼; and the fastest four miles, 7.15¾—the latter 3¾ seconds faster than any horse has ever run four miles.....

Coffee culture in Central and Southern California is reported to be getting profitable, the plant growing vigorously and yielding a bean of strong and aromatic flavor.....A French company for the manufacture of beet sugar in Canada has been definitely organized—capital 6,000,000 francs, of which 1,000,000 have already been paid up..... It seems likely that there will be a reduction in the acreage of Spring wheat this year, owing to the early stoppage of preparation of the ground in the Fall, and to the lateness of the Spring..... Lately at Delano, Kern Co., Cal., no less than 120 expert shearers were busy clipping the fleeces of 200,000 sheep.....January last was the coldest month in Scotland of which records exist. The lowest temperature authentically recorded was 15 deg. Fahr. below zero at Stobe Castle in Peeblesshire.....The Canadian Minister of Agriculture has addressed, through Gov.-Gen. Lorne, a memorandum to the British Government proposing an extensive organization of Irish emigration to Manitoba and northwest Canada.....The total value of the exports of domestic breadstuffs during the month of February, 1881, were $19,919,246, and during February, 1880, $14,420,544; during the eight months ended February, 1881, $182,428,826, and during the eight months ended February, 1880, $183,835,659.....Mr. Gladstone stated Monday in the House of Commons that he expected to introduce the Irish Land bill on the 7th of April..... ....In Germany the crops of lucerne are being destroyed by a disease said to be caused by a small eel-like worm found only in clover and lucerne, which causes a malformation of the roots which soon die away.....The new English Wilts and Hants Agricultural College is henceforth to be known as simply the "College of Agriculture." .....In order to encourage the manufacture of beet sugar Canada exempts it from excise duty for eight years.....The English Agricultural Commission cost last year $79,250; this year its cost is estimated at $63,200, and how long it may last no one can foretell.....

Throughout the Winter wheat region in the Northern States the general report is that the continuous snow has kept the Fall-sown grain from any serious injury, and that, as a rule, it will prove in good condition.....The Mark Lane Express of March 21 says that the previous week's fine weather had inestimably benefited agriculture. Young wheat, though backward, was assuming a healthy appearance..... ...One-third of the London supply of wheat comes from this country..... ..Steamers carrying cattle from the United States to Great Britain are liable to a month's quarantine before they are permitted to carry cattle thither from Canada.....In some parts of the West the ground is frozen so deeply that the roots of the tea plants in China are injured.....A commission appointed by the Agricultural Society of France to investigate the effect which the rapid import of American flour is likely to have on French agriculture has reported in favor of a protective tariff of 57 cents a barrel on American flour.....An English farmer who had lived several years in Canada recently returned to England, taking with him a number of Colorado beetles as a curiosity. Five of them escaped, and the amateur naturalist was arrested and fined $25. The matter has been brought to the attention of the House of Commons, while the people in the vicinity have formed themselves into a committee of the whole to capture the "blasted foreigners"..... ...Guatemala, almost under the equator, had a heavy frost February 10, destroying crops on every hand. The crop on a Chimoltenango tobacco plantation containing over 100,000 plants was ruined.....A detailed statement of the packing operations in Chicago for the 12 months ending March 1 show an increase in business both for the Summer and Winter months, the aggregate being the largest number of hogs ever packed in any city in the world in any one year. The number packed was 5,752,191, an increase over the preceding 12 months of 1,071,554. The receipts of live hogs during the year were 7,059,355, and the shipments 1,394,220; 316,884 tierces of lard were made, 260,970 barrels of pork, 23,767,603 pounds of green meats, 38,166,035 pounds green and dry salted, 11,372,895 pounds of Cumberlands, 60,642,845 pounds of short ribs, 38,109,996 pounds of short clears and 52,579,140 pounds of long clears.....

A Certain Cure.

The first thing to do in the Spring is to clean house. For internal cleansing and renovating, no other medicine is equal to Kidney-Wort. In either dry or liquid form it cures headache, bilious attacks, constipation and deranged kidneys.

Women that have been pronounced incurable by the best physicians in the country, have been completely cured by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

THOSE of our readers who are anticipating purchasing a rifle, will do well to examine those made by the Mass. Arms Co., Chicopee Falls, Mass. A handsomely illustrated Circular and Price List are sent free. Send for it.

We know Hop Bitters are above and beyond all as a nutritious tonic and curative.

BURNETT'S COCOAINE
The Best of all Hair Dressings.

It allays irritation, removes all tendency to dandruff, and invigorates the action of the capillaries in the highest degree, *thus promoting a vigorous and healthy growth of hair.* Its effect upon the glossiness and richness of the hair is such as *cannot be surpassed.*

Burnett's Flavoring Extracts are the best.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, March 26.

Fair to choice roll butter sells at 16@19c. CHEESE—Good to choice full-cream cheddars at 12½@13c, with late made do, in a small way, at 13½@14c; slightly skimmed do at 10½@11c; good to prime flat shapes at 9½@10c, and the poor to only fair qualities at 7@9c. EGGS—At 18@19c ₰ doz. the inside figure for loose packages. HAY—No 1 Timothy $14 75@$15 50 ₰ ton; No 2 at $13@$14; mixed do at $12@$13; upland prairie at $11 50@$13 50; No 1 prairie at $9@$10; No 2 do at $7.50@$8.50. Small bales sell for 20@50c ₰ ton more than large bales. SEEDS—Business was very quiet in this line on yesterday, and the tone of the market was rather weak. We quote as follows: Prime to choice Timothy $2 62@$2 67 ₰ bushel; common to good $2 50@$2 60; prime medium clover $4 70@$4 85; choice do $4 90@$5; flax $1 18; Hungarian 70@80c; millet 90c@$1; German millet 90c@$1 05, according to quality. HOGS—Market slow, weak, and 5@10c lower than yesterday remain unsold; quality good; light, $5 60@$5 80; packers and shippers bought sparingly; a number mixed packing, $5 30@$5 50; good to choice heavy, $5 90@$6 05; one very fine lot at $6 50. CATTLE—Market week and easier, with a fair demand; common to fair shipping, $4 40@$4 60; good to choice, $4 90@$5 40; exports, $5 50@$5 75; corn-fed Texans, $4 40; butchers' fairly active, but weak; common to fair dull at $2 25@$2 75; good to choice steady at $3 25@$4; stockers strong and more plenty at $3 20@$3 90; feeders, $3 75@$4 50. Calves, $9@$16 ₰ head. SHEEP—Market slow and 15c lower than yesterday; Texans, $3 70; fair to good, $4 50@$5 05; choice $5 40@$5 60; Sheep and Lambs, mixed, $5 60@$5 75; only fair demand; not all sold.

Cincinnati.—WHEAT No. 2 Red Winter, $1 09. CORN.—Demand fair and market firm; No. 2 mixed 47c. OATS steady, with a fair demand; No 2 Mixed, 39c. RYE quiet; No 2 at $1 13. BARLEY in good demand and strong; No 2 Fall, $1 09. PORK firmer at $15. LARD firmer at $10 35 bid, bid, $10 50c, asked. Bulk-meats firmer; Shoulders, $4 85; Clear Rib, $7 72½c. Bacon quiet but steady; Shoulders 6¾c; Clear Rib, $8 60; Clear Sides, $8¾. Hogs firm for light, dull for heavy weights; common $4 25@$5 10; light $5 60@$6; packing $5 50@5 70; butchers' $6@6 40. BUTTER Fancy Northwestern Creamery sells at 30c, choice Dairy at 25c, choice Western Reserve at 23@25c, prime to choice Central Ohio at 20@22c, and common medium do, at 15@18c per pound. CHEESE 12@13c, for prime to choice but late made Northwestern is offered at 11@11½c ₰ lb. EGGS, market steady at 15@15½c per dozen, with sales mainly to the local trade at the latter figure. HAY—The arrivals have been scarcely equal to the current demand and the market is stronger. Common sells at $14 50@15 50, prime do, at $16 50@17 00 ₰ ton, and Prairie hay at $10@11 per ton, in bales on arrival. Wheat and Rye straw is steady at $8@8 50 and Oats straw firm at $9@9 50. SEED—The demand is less active, and as the offerings are more liberal especially of old Clover seed the market is slow at lower prices. Prime old Clover sells at 8@8¼, prime to choice new do at 8¼@8½c ₰ lb, and Timothy at $2 75@2 85 ₰ bushel from store. Round lots on arrival would not bring these prices. Flaxseed is in demand at $1 12½@1 15 ₰ bushel. MILL FEED, is in moderate supply and firm. Bran sell at $14 75@15 00, shipstuffs at 15 50, and middlings at $17@20 per ton in bulk, and 50c more in sacks on track

St. Louis.—WHEAT—No. 2 Red Fall, $1 05, cash; No. 3 do., 93½c. CORN, 41½c, cash and April. OATS 36¼@36½c., cash. RYE firm at $1 05. BARLEY quiet at 80c@$1 05. PORK firm at $15 50, April. Lard higher at 10½c, bid. Bulk-meats higher; Shoulders, $4 90@4 90; Clear Rib, $7 65@7 75; Clear Sides, $7 85@7 90. Bacon higher; Shoulders, $5 62½; Clear Rib, $8 50; Clear Sides, $8 70@8 85. POTATOES—Choice Eastern—Peerless 85@87½c, Rose 87½@90c, Burbank 90@92½c, Peachblow 92½@95c. Western—Peachblow 75@85c. Early Rose 75@80c; mixed, 60@70c; interior and damaged, 50@60c. ONIONS—Prime $4 25@4 50 ₰ bbl or $1 70@1 85 ₰ bush.—top figures for red only; sprouted or damp $3 to $3 50 ₰ bbl. SEEDS—German millet stiffening—Interior and dairy at 75@85c, prime 97½c@$1; clover lower at $4 90@4 95; common millet quiet at 65@72½c; Hungarian do at 55@65c; redtop steady at 45@47½c; timothy neglected, at $2 45@$2 55; flaxseed, $1 10 on a basis if pure. HOGS—Yorkers and Baltimores, $5 50@5 70; mixed packing, $5 20@5 50; good to choice heavy, $5 75@6. CATTLE—market active; exporters, $5 25@5 75; good to choice, $4 60@5 15; medium to fair, $4@$4 50; best butchers' Steers, $4 25@4 60; fair to good, $3 50@4; Cows and Heifers, $3 25@4 25; stockers, $3@3 75; feeders, $4@4 60; corn-fed Texas Steers, $3 25@3 75. SHEEP—market active; medium to good, $4@5 15; choice to fancy, $5 25@5 85.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 26 1881.

BEANS AND PEAS.—There has been a better call for beans for export and home use, and prices strengthened promptly under it. This shows that notwithstanding the large comparative receipts, dealers are pretty well assured of their position so far as white standards are concerned. Red kidneys and black beans are a drug.

Green peas plenty and weak; $1.70@1.75; Southern B. E. peas $2 25@2.35, Medium, marrow, pea and white kidney beans, $1.90@2.12½; red kidney, choice, $1 55@1.60, other, $1.40@1.50, black or turtle soup, $1.40; Cal. Lima, $4.50@5.

BUTTER.—New has already become a feature in the local trade and its presence increases the disposition to part with old. This of course does not strengthen the latter in prices even for the best flavored parcels. For common to medium class goods the feeling is weak and the position precarious. A good many lots that should have been sold early for cheap table use will have to degrade to grease. A few long established dairies are still selling on their butter merits, but even these begin to seek buyers.

New creamery choice 34@35c; good to prime 32@33c.; fair to good 30@31c.; State half firkins, 28@30c; other 24@26c; Welsh, 24@29c. Old creamery, 17@23c.; State dairies, 19@25c; firkins, 15@23c., State pails fall 26@28c; other, 14@23c; Welsh 16@20c.; Western imitation creamery, 22@24c.; dairy, fresh 23@26c.; other, 14@22c., factory, 13@20c.; poor Western 10@12c., grease, 7½@8½c.

Receipts for week 23,203 pkgs.

Exports do. 2,171 do.

CHEESE.—Export demand is very moderate and the home trade is without much animation. Prices are held steady, since receipts are small and stocks are showing some reduction. Quotations are for

Fancy at 13½@13¾c. fair to good and prime, 12½@13c.; do. fair, at 11½@11¾c.; do. half-skimmed, 9@10c.; Wisconsin factory, fine, at 12¾@13c.; do. good to prime, 12@12¼c.; do. fair to good, 11@12c.; Ohio factory, fine, 12½@13c.; do. good to prime, 11½@12¼c.; do. fair to good, 10½@11½c.; do. poor to fair 8@10c. Skimmed creamery, 8@9c., and full skimmed factory at 5@6c.

Receipts for week, 18,603 boxes.

Exports for week, 18,645 boxes.

Liverpool cable, 70s.

Steam to Gt. Britain, 25s.@27s.6d.

COTTON—Has had less activity this week, but closed strong at, for

March, 10.70@10.71c.; April, 10.66@10.67c.; May, 10.74@10.75c.; June, 10.83@10.84c.; July, 10.91@10.92c.; August, 10.95c.; September, 0.03@10.04c.; October, 10.34@10.36c.; November, 10.23@10.24c.; December, 10.22@10.24c

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Receipts for the week, 18,832 bales. Exports do. 13,326 do.

DRIED FRUITS.—Apples have had a fair inquiry and prices firm. Peaches show more activity especially in unpeeled peaches halves which were taken at 6@5¾c, a decline. Small fruits are in full demand and well sustained in price. Quotations:

Evaporated apples at 8@8¾c. for choice to fancy; sliced apples at 4¾@5¾c. for good to choice North Carolina; 4@4¼c. for Va, apples, 4@4¼c. for Tenn. do; 4¼@5c. for State do; 4¼@4¾c. for western, Ohio and Mich. Peaches at 22@23c. for evaporated peeled; 13½c. for unpeeled do.; N. C. peeled at 19@22c.; for the better qualities, unpeeled peaches at 6@6½c. for halves and 6@6¾c. for quarters. Plums at 16@16c. Blackberries at 8c for prime. Cherries at 17@17½c. Raspberries at 25c. Whortleberries 10@11c.

Receipts for the week, all kinds, 638 pkgs.

Exports dried apples, 4,261 pkgs.

EGGS—Receipts for week, 13,500 bbls.; do. last week 11,226 do. During the week the market took a spurt and prices have been 1@1½c. higher than quoted. The market closes in buyer's favor, but an encouragingly active trade prevails. The market has not worked so well during the Lenten season for sev

eral years. Duck and goose eggs not specially active.

Near points, 21¼@22c.; State and Pa., 21¼c.; Western, 21@21¼c.; Southern, 21c.; duck 30c.; goose 48@50c.

FLOUR.—The market shows irregularity and closed in buyer's favor, with a fair trade in progress. Shipments this week have been 79,000 bags and 5,800 bbls. Latest prices are; $4.50@4.09 for very inferior to very choice superfine State and Western; $4.25@4.30 for poor to choice extra State and Western, odd lots and lines; $4.50@4.65 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4.35@5.25; good to choice do. at $5.35@6.10; (very choice up to $6.25@6.50 and fancy at $6.50@6.75;) red and amber winter wheat, inferior to choice trade and family at $4.35@6; round hoop Ohio, $5.35@4.75; and trade and family brands of do. at $4.85@6.25, the latter for very choice; St. Louis $4.00@5.50 for inferior to good extras; $5.50@4.35 for good to choice, and up to $6.75@7 for very fancy brands; Minn. clear, inferior to very fancy at $4.30@5.85; Minnesota "straight," poor to very choice, at $5.25@6.75, and patent inferior to fancy at $5.75@8.25; city mill extra at $5.60@5.70 for fair to choice for the West Indies; do. for Scotland at $4.25@4.65 for poor to choice spring wheat; do. trade and family extras $5.60@6.75; do. for South America, $6.75@6.00, the latter for very choice; No. 1 at $2.85@3.10 for very inferior to very fancy.

Receipts for week, flour, bbls. 125,250; corn meal, do. 3,161; wheat, bush. 679,700; corn, do. 792,850; oats do. 181,550; rye, do, 31,450; malt, do. 54,700; barley, do. 152,375; beans, do., 5,068; rice, pkgs. 1,178.

Exports for week, flour, bbls. 78 600; corn meal, do. 5,625; wheat, bush 796,950; corn, do. 653,600; oats, do. 3,172; peas, do 4,200; beans, do. 631; rice do. 1,162.

FRESH FRUITS.—The season shows a rough winding up for apples. It is seldom that a large crop has so poor a chance; the usually long Winter having kept many fine lots housed when they should have been selling, and the wastage is consequently very large. The British markets have proved a good, if not a very profitable, relief. Points have been reached in England and Scotland not before known to the wholesale apple trade and the favorable feature is the fact that a larger line of consumers will henceforward call for stock. London at the present time uses 4,000 to 6,000 bbls per week. Mixed lots late arrivals $1@1.25.

Bld'ns $1@1.05; russets $1.37@1.75; greenings $1@1.37; Spitzenbergs $1.50@2; rejection 50@75c. cranberries dull and nearly nominal; crates quoted in a small way at $1@1.75. Fla. oranges hold a good place when choice; sales, however, begin to be forced and $1.50@3.10 is a full range for original packages. Fla. strawberries run poor; best 75c; poor 20@50c. per qt. Hot-house strawberries $1.50@2 per quart. There is no change in nuts and last figures are full.

FURS AND SKINS.—The Producers Price Current says:

"Cable advices from C. M. Lamson's London sale report that beaver and musk rat advanced 10 per cent. as compared with the prices obtained last January. Marten, lynx and large northern raccoon advanced 10 per cent. and fresh skunk 20 per cent. compared with the July sale. Blue fox advanced 40 per cent., otter 7½ per cent. and large bear and wolf 20 per cent. compared with last March sale. Silver fox other than Alaska and sea otter sold same as last March and old skunk same as last July. Opossum declined 15 per cent. compared with sale of last January. Southern and small raccoon declined 5@15 per cent., all thirds and fourths of raccoon about 15 per cent., red fox 10 per cent. cross fox 25 per cent., and gray fox 20 per cent. compared with sale of last July. Alaska silver fox declined 25 per cent. White fox 10 per cent and Russian sable 10 per cent. compared with sale of last March. Fisher and mink are yet to be heard from.

The advances reported had been fully anticipated in the market here, but many of the declines were unexpected. Raccoon, opossum and fox are generally lower and weak. Mink are very dull. There is a stronger feeling in the best grades of skunk."

Quotations will be secured by next week.

GRAIN.—Wheat has been fairly active for export. Some 960,000 bush. shipped this week. Prices have towards the close tended lower on increasing movement forward of supplies: latest prices are for

No. 1 white at $1.20@1.21½. do. March at $1.20½@1.21½; do. April at $1.18½@1.19½; do, May at $1.19½@1.20; ungraded white at $1.16@1.20; No 2 white at $1.17@$1.17½; do. March at $1.22½@1.23½; do. April at $1.21½@1.22½; do. May at $1.19½@1.20½; do. June at $1.18½@1.19½; No. 3 red at $1.19½@1.20½; ungraded red at $1.14@$1.26½; No. 3 spring at $1.15.

Rye at $1,06@1.06½.

Corn has shown shipments for the week or nearly 900 000 bush., but closed weak in price on freer arrivals. Latest prices are for

New York No. 2 at 59@59½c, do. March at 59½@59½c; do. April at 57½@57½c., do May at 54½c; do. June at 54½c; No. 3 at 57½c.; ungraded mixed Western at 56@59½; New York steamer mixed at 58½@59c. No. 2 white at 60c.

Oats have been in active speculative demand, but closed with freer offerings and prices easy; latest prices are for

No. 1 white at 50; New York No. 2 white at 45@45½; No. 3 white at 43½@43½; New York No. 2 at 44@44½, do. March at 44½ do. April at 43½; do. May at 43½; No. 3 at 43½@43½; ungraded white Western at 44½@43½; ungraded mixed Western 43@44½; white State at 47½@51. No. 2 Chicago quoted at 44.

HAY AND STRAW.—Arrivals have been larger and prices tending lower especially for the common grade of hay. Latest prices are for:

Hay, prime timothy at $1.10 ₹ 100 lbs.; medium timothy at $1,05@1.10 do.; shipping grades at 100@$1 do.; clover mixed at $1.00@1.05, clover at 95c.@$1 do. Straw—No. 1 rye at $1,15@1.20 ₹ 100 lbs.; No. 2 rye at 75@80c. do.; oats and wheat at 70@75c. do.

Exports for week, 1,811 bales; since Jan. 1 '81, 13,613; same time last year 23,397.

HOPS—Shipments this week have been 728 bales. Demand has been light both on export and home trade account, but prices held firmly. Quotations are for

	Cents per lb.
New Yorks, crop 1880, choice	22 @23
Do. medium	19 @20
New Yorks, crop 1880, low to fair	15 @17
Eastern, crop 1880	16 @22
Wisconsin, crop 1880	16 @23
Yearlings, crop 1879, choice	12 @18
Olds, all growths	4 @10
Bavarians	30 @35
Pacific coast, new	19 @23

Receipts for week, 1,586 bales.
Exports do., 603 do.

POULTRY AND GAME.—Dressed poultry, with moderate supplies has a very strong position; prices for killed or frozen very firm.

Frozen turkeys range 15@18c.; do. fowls, 13@14c.; small fresh-killed turkeys, 16@17c.; other, 14@15c. Chickens, broilers, 22@23c.; do. roasting 18@20c. N. J. and Bucks Co. 16@18c.; other, 13@15c. Chickens and fowls, 13@16c; Phila. fowls, 14@15c.; other 12@14c.; Capons, large, 22@23c.; small and slips, 18@20c. Ducks, 15@20c.; Geese, 8@11c; squabs, white, $1.50 ₹ doz.; do, dark, $1 25@2.50

City killers are operating quite freely and prices are strong for cooped stock at the close. There is no surplus of any sort.

Fowls, 12½@13½c.; roosters, 6@8c.; turkeys, 12@14c.; ducks, 70c@1.12; geese, extra, 2.12, other, $1.25@1.75; pigeons, 35@45c.

English snipe are scarce and firm at $2.50@2.75 ₹ doz Few pigeons in market; a fair offering would bring $1. Wild ducks are variable in quality, and as a rule prices are low; Western not wanted.

Norfolk Canvas-backs quoted 75@$1; red-heads, 50@60c; mallard 40@50c.; teal and widgeons 20@25c.; common, 15@20c.; Havre de Grace birds exceed these rates 25@50c. ₹ pair.

PROVISIONS.—Hog products have tended lower, but closed firm.

Mess pork quoted at $15 for old and $15.75@16 for new. 15.60@15.70 for April delivery, and 15.80@15.90 for May delivery. Bacon at 8 30 for long clear and 8.75 for short clear. Beef hams at $22½@23. Beef at $21@23 for extra India mess. Tallow at 66-16@6¾ for prime. Stearine at 11½@11¾.

VEGETABLES.—The Hudson now admits of deliveries and for common quality potatoes the situation is weak. The general tone of the market is dull and is likely to run unsettled for a time until stock is classified. New arrivals of State potatoes are of very irregular quality.

New Bermudas higher, $6@7 ₹ bbl.; Early Rose, Eastern, $2.50, do, State, $2@2.25; Prolific, $2; Mercer, 1.75@1.87; Jackson White, $1.75; Burbank, $2 00@2.25; Snowflake, $1.75@2.25; Peerless, $1.50@1.75; the highest prices are for double-headed bbls. Sweet potatoes dull at $2.25@2.50. Southern garden stuff enlivens the market, but the weather has been unfavorable for use and show and prices are irregular. Onions have declined; in fact all old stuff has a cheaper tendency. Fla. green peas, $2.50@4.50 ₹ crate; do, tomatoes, $2.50@3 ₹ half-bush. box; Bermuda tomatoes, 90c.@$1 ₹ 6-quart box; do. beets $2@2.50 ₹ crate; do. onions, $5; Norfolk Spinach, $1.50@3 ₹ bbl.; do. kale, $1@1 25; do. radishes, $3.50@4 ₹ 100 bunches; Chas. asparagus $10 ₹ doz.; beets, 75c@$1 ₹ bbl.; carrots, $1@1.25; Hubbard squash, $1@1.25; marrow do. 50@75c.; onions, white, $3.50@4.50 ₹ bbl; other, $2.50@3; celery, $1@1.25 ₹ doz.; cabbages, $4@7 ₹ 100. Hot-house products—Cucumbers, $3@4 ₹ doz.; mushrooms, 75@90c. ₹ bbl.; lettuce, fine, 75c.@$1 ₹ doz.; other, 35@62c.; radishes, $4@5.50 ₹ 100 bunches; rhubarb, $1@6.

WOOL.—The market continues depressed on the pressure to sell in view of the approaching new clips; prices are unsettled. Quotations for new fleeces are as follows:—

Ohio, Penn. and Va. XXX and picklock, 45@47c.; XX, 42@43c.; X, 40@42c.; No. 1, 46@47c.; No. 2, 40@42c.; common, 36@38c.; combing, 45@48c.

N. Y. State, Mich., Ind. and Wis. XX, 38@40c.; X, 37@40c. No. 1, 44@46c; No. 2, 34@40c; common, 35@38c.; combing, 42@45c

Iowa, Vt. and Ill., X and XX, 35@38; No. 1, 42@44; No. 2, 35@38c.; combing, , 40@43c.

Mo., Ky. and Tenn. washed fleece, 38@43c.; unwashed fleece, 25@30c.; unwashed combing, 27@33c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, March 26, 1881.

BEEVES.—Receipts for the week 8,393 head: do. last week, 10,936 do. Supplies have run remarkably light for a cold weather week, but the fact did not produce much competition on the part of buyers. Lent still causes many besides, we are at the height of the season when the weather can turn disastrously warm for large lots of dressed carried by wholesale butchers. The range of prices is close and has ruled so all the week; nothing sold below 6¾c. to dress 55 lbs., and the bulk of the sales may be quoted at 10@11½c, with a few extra steers at 12c. Several failures of late have given a blue tinge to the cattle trade.

MILCH COWS.—The run of car-loads range at $30@55; several extras quoted $62. Market dull.

VEAL CALVES.—Market firm for good stock, choice State and New Jersey showing an advance from Wednesday's figures.

Live calves, choice fed, including Mt Holly, 8@8½c; fair to prime, 6@6½c.; poor, 5@5½c.; buttermilk, 4@5c.; grassers, 2½@3½c.; dressed, best, 10@10½c.; poor to good, 7½@9½c.; very poor, 4@6½c.

SHEEP AND LAMBS.—Receipts for week, 22,169 head; do. last week, 24,179 do. There is an easy feeling in the sheep market—sheep regarded well sold at 6¼@6¾c.; a car-load of extra wethers 7¼c., and one of clipped was held at 5¾c. Yearling lambs, 7½c. Spring lambs $4@8 ₹ head; quality poor, hence the low range.

SWINE.—Receipts for the week, 13 764 head; do. last week, 14,921 do. Trade rather quiet.

Live at the yards, $6@6.40 ₹ cwt.; country dressed pork, light, 8¼@8½c.; medium, 7½@8c.; heavy, 7¼@7½c.; city dressed Western, 7¾@8c. Pork tenderloins, 11½c.

ASPARACUS, NEW VARIETY.

Smalley's Extra Early Defiance; 2 weeks earlier than Colossal, a larger, softer grass; far superior to all other varieties. One acre will produce more grass with the same treatment than 2 acres of Colossal. It is the best Asparagus grown, either for private use or for market. Two-year-old plants, $5 per 100, $30 per $1 000; seed, $12 per lb. Address A. SMALLEY,

Box, 29 Bound Brook, N. J.

Read the following letter:

PETER HENDERSON,
SEEDSMAN AND FLORIST,
Greenhouses, Jersey City Heights, N. J.
Seed Store, No. 35 Courtland Street, New York.

NEW YORK, July 2, 1879.

MR. SMALLEY: Dear Sir: My son informs me that you called the other day, and in talking about the asparagus that you evidently misunderstood our offer—our offer as I made it would be from $1,000 to $1,500, according to the quantity you had of seeds and plants. I write this thinking you may yet consider it, but if so you must do it at once; in ten days it will be no use to us at any price, as our catalogue is in preparation, and if we had to have a cut made we have no more than time now to do it to meet fall trade. The cut and advertising would cost us at least $1,500, and we have gone over the whole thing carefully and have decided that the offer we made you is all we can afford to give, so if you wish to accept it you must do it within ten days from this date or we must be counted out; after that date we could not touch it at any price. Very truly yours,

PETER HENDERSON.

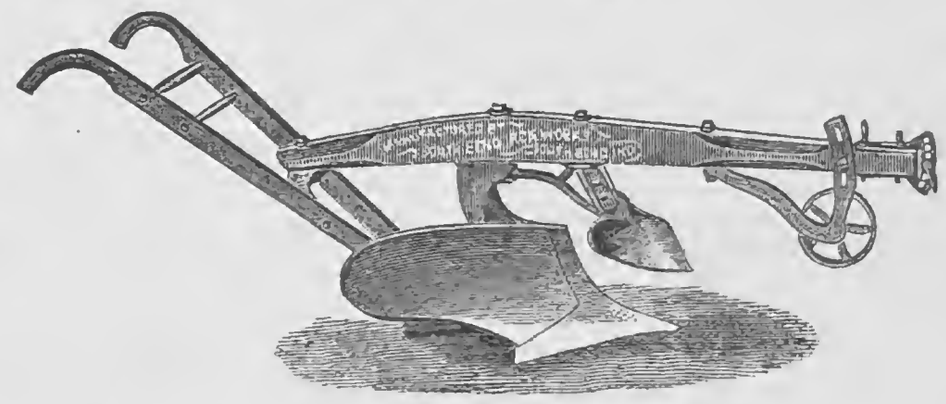
THE PLOW OF THE PERIOD.

THE "OLIVER CHILLED."

1,500 Sold in 1870.



86,000 Sold in 1880.

Ten years ago almost unknown—to-day doing service on over

HALF A MILLION FARMS.

Sales steadily increasing, and showing the largest ratio of gain where it is best known.

Endorsed by the best agricultural authorities in the country—and its superior merits confessed by a brood of puny imitations.

With 700 men, nearly a million dollars of capital, and acres of buildings and machinery, employed in its production—the demand for this—

THE LEADING PLOW OF THE AGE,

has been during the past year beyond our capacity—a state of facts never before witnessed in the

ANNALS OF THE PLOW TRADE.

THE

"CASADY" SULKY PLOW.

A revolution in the art of plow-making. Has no Landside! Carries every pound of side and bottom pressure on its wheels! Guages the width of its own furrow! Turns square corners without lifting out! Rides over buried stones without disturbing the truck! Works in the hardest, dryest ground! and accomplishes other results not possible to any other plow on wheels.

Reading for the Young.

HIDING "EASTER EGGS."

SCAMPERING through the barn yard,
Nellie, Fred and Bess,
Hiding "Easter Eggs" away
Just where you'd never guess.

Not in the great old hay-mow,
Nor corner of manger or stall;
"O, Mamma," cried Bess, "you need'nt try,
'Cause you'll never guess at all."

"You know Mamma said we might hide them
Just anywhere we please;"
Nell, did you ever see such eggs,
Such nice large ones as these?

And we're going to color *lots* of them,
Mamma says she'll help us too.
I am *so glad* that Easter comes,
And Nellie and Fred are, too."

O, innocent joys of childhood!
Sometimes our heart still begs,
For the feelings of mingled joy and pride,
In hiding "Easter Eggs."

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

ALICE P. ADAMS.

The Orange Trees.

"What smells so sweet?" asked Daisy one day soon after her arrival.

"Why, that is the orange blossoms!" cried Violet. "Haven't you seen any yet?"

"No," answered Daisy, "I know which are the orange trees, but haven't looked at them closely."

"Let's go out and pick some oranges and you can have all the flowers you want. There is papa poisoning gophers; he will explain about the trees, though I can tell almost all the different kinds."

The girls walked along to where Mr. Erman was stooping on the ground, some peach sprouts lying by his side, and before him a small pail containing bits of sweet potato. "Still at it, you see," he remarked, as the girls came near; "these gophers are never idle. They burrow under the ground and eat the roots of the trees, and unless I am constantly on the lookout my trees are killed almost before I know it. So every day or two I go around with my medicine."

"How do you know where they are if they never come above ground."

"Oh, they usually work near enough to the surface to throw up some loose dirt like that mound yonder. There's a fellow I must take care of. Then I dig down till I find the runaway, stick a poisoned bit of sweet potato on a peach sprout, put it down in the hole, cover it and that usually finishes Mr. Gopher.

"There papa, we didn't come to hear about gophers. Daisy wants to see the orange trees."

"Well, here they are all around us; plenty of flowers, too. Pick some for her, Violet."

Some of the trees were white with blossoms, and the air was laden with fragrance. Violet began breaking off the flowers with such a lavish hand that Daisy expostulated. "There, there! Don't pick any more of the beauties! Just think how many oranges you have spoiled already!"

Violet and her father laughed. "You foolish child, don't you see what quantities of flowers there are? These little trees never could support so many oranges. Papa will have to thin them out, so don't deny yourself any orange flowers whenever you take a fancy for them."

"How beautiful the trees are with the white blossoms, bright oranges and glossy leaves! Why are some of the leaves so light?"

"Those are the new growth. It has been so warm this winter, and we have had so little frost, that the trees have grown right along, though not as fast as they do in Summer."

"I always thought that orange trees were very large before they bore, but look at this little thing," said Daisy, pointing to a diminutive specimen about three feet high, bearing half a dozen handsome oranges.

"Seedlings do not bear until they are from six to nine years old; but these trees are all budded. This is the way we bud a tree," continued Mr. Erman in answer to Daisy's inquiring look, "we generally take a seedling and cut the bark of the trunk in a certain manner, and insert a bud from some variety that we wish to propagate. This bud does not come from the end of a twig, but from the axil of a leaf. Then when the bud begins to grow we cut off the seedling top, and the whole tree is grown from that bud. In a few days I am going to bud some stock and you must come and see how it is done."

"It seems a pity to cut off the trees," remarked Daisy.

"Yes, but if these were not budded trees there would not be an orange on the place to-day. These trees are nearly four years old from the bud, and have not been set three years; and look at the hundreds of oranges. Next year I expect to have thousands instead of hundreds."

"When do you pick the oranges, Mr. Erman?"

"They do not become nice and sweet until about this time, though some pick them as early as January; but I think they are too sour then. From March to May is the best time for California oranges. They have been picking for some time in the large orange groves which are from twenty-five to thirty years old; but there are a great many oranges on the trees still, and we must take you to see the old ranches the first day I can spare."

"I should think it would hurt such little trees as some of these to bear so many oranges."

"I don't see that it hurts them any. The trees that bore last year are bearing now, and seem to have made as much growth as the others. Besides, I never allow a tree to have more fruit than it can mature without hurt to itself. You remember the thinning process of which Violet told you."

"But, Mr. Erman, if these trees are all the same age, why should there be any special difference in their size?"

"Because they are different varieties. These rows of tall trees with the very large oranges are the Konah, and the rows beyond, with fruit a trifle smaller, are the Rio. These light-colored oranges of medium size are the St. Michael and Mediterranean Sweet. Then we have the Maltese Blood, which is red, as its name indicates, the Du Roi, Tahita, Bergamot, Mandarin, and other standard and fancy varieties—about seventeen, I think, and six kinds of lemons."

"I didn't suppose there were so many different kinds."

While Daisy and Mr. Erman were talking Violet had been filling a basket with the golden fruit, and now, slipping her hand through her friend's arm, she said:—"Come, Daisy, you have learned enough about the oranges, and I want you to eat your fill. Last January, when Mr. Hopkins and his wife were here, they would persist in eating the green oranges, and then went back East and told every one that California oranges were *sour*. I was so provoked I didn't know what to do, and you must prove the statement to be *utterly false!*"

THE "YOUNG QUERIST."

W. C. H., New York City.—We have no seeds of the Golden Rural Tomato to sell.

A. S. L., Livingston, N. Y., asks if the firm of Burt and Prentice, 46 Beekman St., N. Y. are reliable.

ANS.—We believe they are. Your complaint will be referred to them.

C. L. D., Edgerton, Kan., asks 1, how many tons the largest ship will carry. 2, how many miles the largest ships will run in an hour.

ANS.—The Great Eastern is said to have been built to carry 10,000 tons; 2, eighteen miles an hour is the fastest time ever made by ocean steamships.

N. B., Almond, N. Y., wishes to know what will keep the little white worm away from the roots of plants.

ANS.—We presume you refer to house-plants. The little white worm is most common in the roots of the geranium and seems to come from decaying matter produced by keeping the plant roots too wet. We do not think you will be troubled if your flower pots have proper drainage.

M. V. S., Racine, Wis., asks how she shall treat Japan Quince seeds saved last Fall, also the little black berries from the Honeysuckle? Do they contain seeds, and when should they be planted?

ANS.—The little black berries are seeds. In raising the Honeysuckle from seeds they should be sown in the Autumn after they are ripe or they will not come up the first year. Both the Quince and the Honeysuckle are propagated by cuttings.

I. M. D., Boulder, Col.—Please tell me when and how to plant peas so they will not be buggy.

ANS.—You ask a difficult question, since the pea-weevil, to which you probably refer, begins its existence in the pea itself; hence, wherever the pea is sown, just there will be the weevil. One method suggested to get the better of these pests is to keep the seed peas over one year in tight vessels. Some recommend putting the seed peas in hot water a minute or two before sowing, by which means the weevils will be killed and the sprouting of the peas will be quickened. Late-sown peas are less liable to the attacks of this weevil.

LETTERS FROM THE COUSINS.

How to Do It.

UNCLE MARK:—Our children, who took much delight in their lessons in botany last Summer, have found out—through their examinations of different flowers and seeing the regularity of their parts—a pleasant evening puzzle for the cousins. Apples or pears being brought in, they challenge the uninitiated to cut a piece out of an apple from eye to stem without cutting into a core-cell or touching or showing a seed. The one party does this unfailingly every time, to the wonder of the other. They do it by taking care to choose an apple in which the five lobes of the calyx are not rubbed off. By cutting straight from one of these lobes the knife is sure to go in the desired direction. W.

Tyrone, Pa.

DEAR UNCLE MARK:—I am only six years old and have just learned to write. I have a big brother Frank nine years old, and a little brother Willie one year old. I have no sisters. My big brother belongs to the club, but he is very lazy about writing. The China pinks you sent him were beautiful. Mamma says I am her little housekeeper; I sweep, dry the dishes, pick chips, and take great care of little brother. I had a fine time Christmas. I went to see my grandma at Newbern and got a load of presents, and came home and had the toothache, but that did not spoil my enjoyment of them. Please to remember me in seed time. Your niece, ETHEL WYSOR.

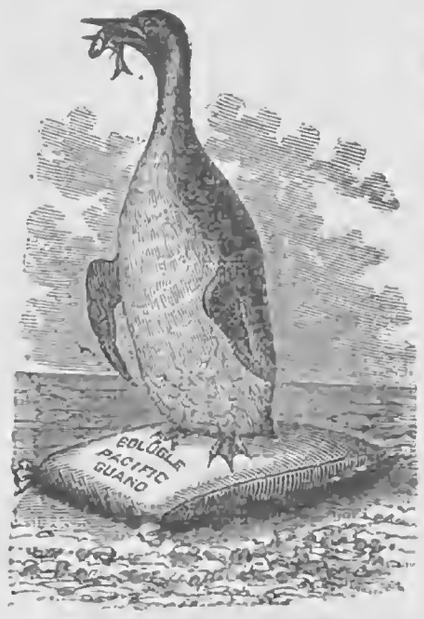
Newbern, Pulaski Co., Va.

DEAR UNCLE MARK:—I like to read the letters from the cousins ever so much. I have been watching the papers every week to see if any little girl from this vicinity would write a letter to you, but so far I have failed to see any, so I thought I would write and ask if I could join your club. I am nine years old and have never gone to school I study at home and mamma hears me recite. I have two cats, a dog and fourteen chickens. My chickens laid 144 eggs last month. The Cuthbert Raspberries that you sent papa did splendidly. The flower seeds I did not plant as I had no place for them. We were living in the city then but now we are in the country. I have a splendid place for flowers. MAUDE CULLEN.

St Paul, Minn.

Parents, do not use vile drugs or nostrums in your families, but use pure Hop Bitters.

Fertilizers.



SECOND TO NONE.

Soluble Pacific Guano.

Sale in 1865 - - - - - 754 Tons.
" 1880 - - - 44,700 "

This Fertilizer, which was at first sold almost entirely in the Southern States, has of late years become so deservedly popular in the North, for the cultivation of all Farm Crops, that the Company have enlarged their works especially to supply the Nothern demand, and we are now in a position to fill orders promptly. Pamphlets containing testimonials and other information furnished by our local agents, or on application to

GLIDDEN & CURTIS,

GENERAL SELLING AGENTS OF PACIFIC GUANO COMPANY
Boston, Mass.

BOWKER'S
HILL AND DRILL
PHOSPHATE
SEND FOR PAMPHLET.

This is a true bone superphosphate, and may be used *on any crop*, in the hill or drill or broadcast, either *with* or *without* manure, and will produce a much earlier and larger crop. In the Report of the Mass. Inspector of Fertilizers, its valuation is from $3 to $10 per ton higher than other Phosphates which sell at the same price. The past year over 3000 tons were sold against 100 tons three years ago, showing that it is liked by the farmers. If there is no local agent near you, send to us.

Also for sale STOCKBRIDGE MANURES.

BOWKER FERTILIZER CO.
BOSTON & NEW YORK

STOCKBRIDGE
MANURES
SEND FOR PAMPHLET.

These manures are the richest fertilizers now manufactured, and the best substitute for, and costing *much less* than guano, which is now practically out of the market. Unlike guano, they *are not stimulants* and *exhaustive*, but *permanent* and *lasting*, being composed of bone, potash, etc. You can draw at one load enough for 3 to 5 acres, or as much plant-food as is contained in 20 loads of ordinary straw manure. Corn, potatoes, hay, etc., are bringing such good prices that it will pay to use the Stockbridge extensively. If there is no local agent near you, send to us.

BOWKER FERTILIZER CO.
BOSTON & NEW YORK.

Carpetings.

CARPETS.

We have now open for inspection and for sale a line of the choicest CARPETS ever offered in New York, of the latest and most desirable colorings and patterns.

WILTON CARPETS at $2.25, full five-frame, and equal in quality to anything offered in this market at $2.75 or $3 per yard.

WELLS, RICHARDSON & CO., Proprietors, Burlington, Vt.
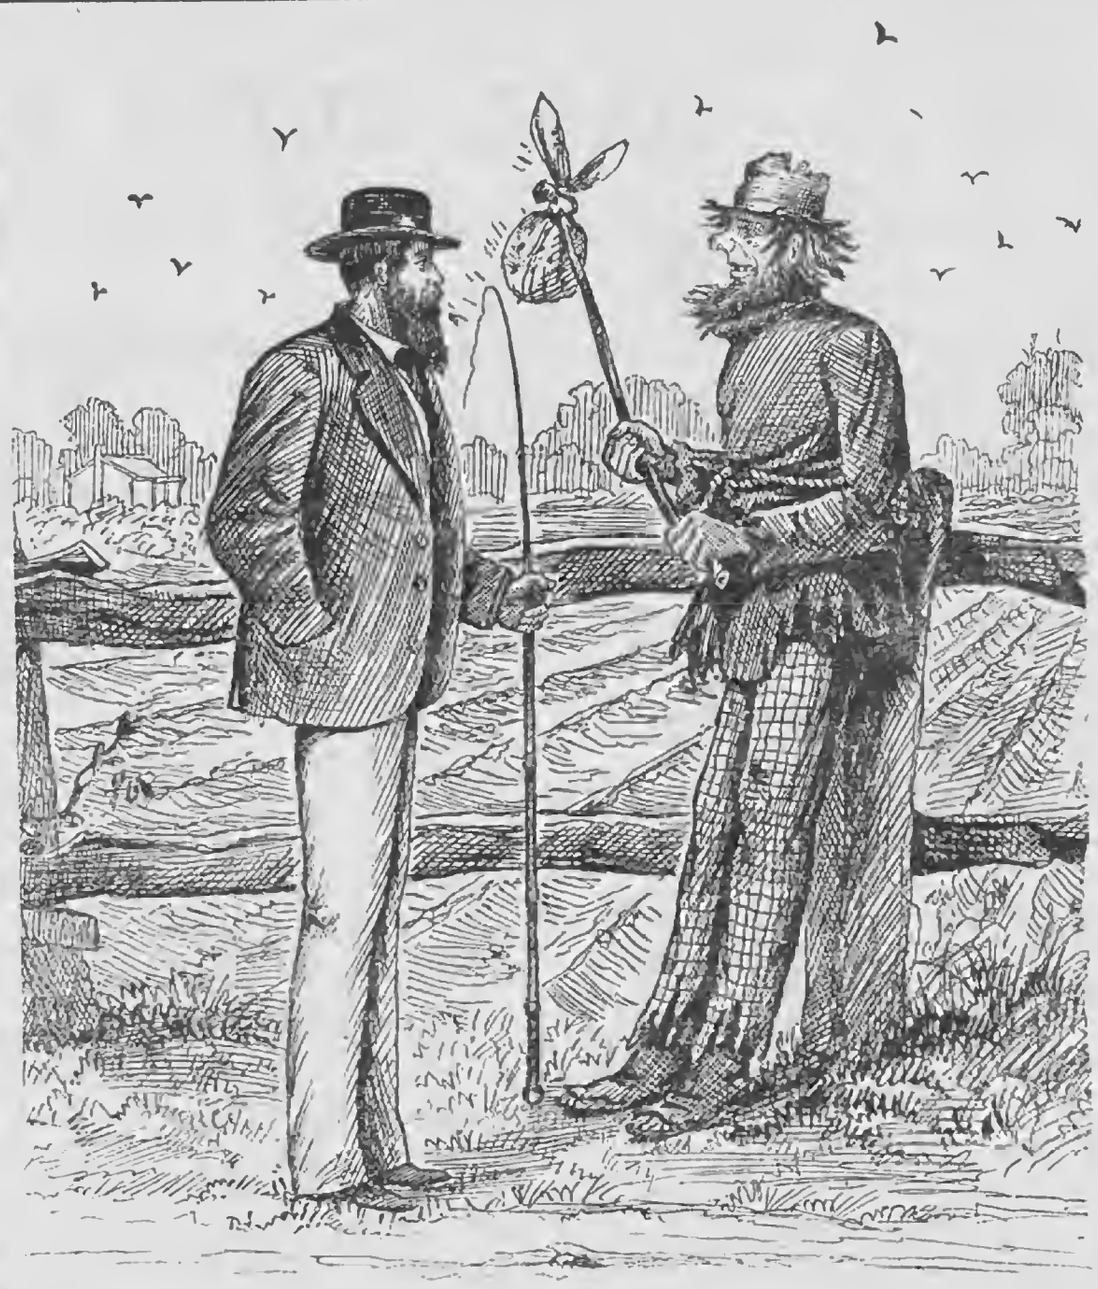
USE ONLY THIS THE FIRST AND THE BEST

Each Change of Season

Brings with it its group of ailments. Spring with its moist atmosphere and sudden revulsions of temperature, brings intermittent fevers, rheumatism and those disturbances of the digestive and secretive organs consequent upon variable atmospheric conditions. Summer is prolific of debilitating diseases. The fall has its malarious fevers and other epidemics. The winter is a trying season to the delicate and fragile. Provision may, however, be made against all these evils by fortifying the system and keeping it fortified with Hostetter's Stomach Bitters. It is the most wholesome vegetable stimulant and alterative at present known, and the only preparation that will effectually defend the vital organization against the influences of unwholesome air, unwholesome water, and sudden climatic changes.



HIS F ORTE.

Farmer—"Looking for work, eh?" What can you do?"
Tramp—"Well, I dont want to brag. I'm kind o' delicate. Hard work don't agree with me, but for sit in' down in a corn-field and scarin' crows away, there ain't no one can beat me."

ESTEY

THE ESTEY ORGAN through its intrinsic merit has won a wide popularity. It is universally known as combining sweetness and power of tone, skilled and thorough mechanism, new and elegant designs.
